MEDICAL STUDENTS' DAY

The "Medical Students' Day" was instituted by the Texas Medical Association and the 1953 program carried out in cooperation with the Dallas, Harris, and Galveston Counties Medical Societies. Subjects vital to the practice of medicine were presented during a one-day visit to each of the three medical teaching institutions which are Southwestern Medical School of the University of Texas, Dallas; Baylor University College of Medicine, Houston; and the University of Texas Medical Branch, Galveston. The speakers were officers of the Texas Medical Association who have had long experience in the practice of medicine and who feel that these indoctrination talks to students serve a useful purpose to these future physicians.

In order to promote a closer liaison with the young men and women who will be the doctors of Texas, the subject matter presented was selected to be of the most practical help. The subjects discussed together with a brief summary of each were as follows:

"You and the Medical Society" covered in detail medical organization at the county, district, state, national, and world levels. The relation to medical practice of each of these organizations was dwelt upon, and the importance of membership and active participation in the affairs of the county medical society was emphasized.

"Your Practice and Public Opinion" covered the broad aspects and application of internal and external public relations. The impressions gained by people as related to the manner with which the individual doctor's office is kept and conducted were pointed out. Organized public relations programs at the medical society level were discussed.

"The Business Side of Your Practice" stressed the importance of having a clear understanding with the patient concerning the cost of a medical or surgical service before it is performed and concerning the terms of payment for said service. If this is done, most misunderstandings between the physician and patient will never exist. Further remarks on fees, office help, billing procedures, and the effects on public relations of the cost of medical care were made.

"Your Responsibility as Doctors" included the judicious use of a heritage of scientific knowledge to the end of furnishing the best medical care possible to all of the people and achieving progress in medicine with each passing year. The individual physician's primary responsibility is to his patient, to give the very best his training, ability, and judgment can offer toward meeting and solving each patient's problems. The physician's responsibility as a citizen is a role he cannot afford to leave unfilled; he must see that the community in which he lives is a good one. A physician is dedicated to the service of mankind and should accept civic as well as medical obligations. The physician's first medical organization responsibility is working to make his county society effectively mean everything for which organized medicine stands.

Hope has been expressed through letters from medical college deans, faculty members, and senior students that this program be presented each year by the Texas Medical Association. Some quotations from these letters follow:

"Your stimulating and challenging message brought us all to the realization of the vast responsibilities which lie before us. We are most indebted for the insight into this oft neglected sphere of medical education."

"We think that a session of the sort that was held so successfully here might well be arranged every other year if the Texas Medical Association would feel so inclined."

"I certainly feel that these meetings which have been held at the various schools in Texas comprise a very needed basic concept in the training of the doctor for the future."

"I recently visited twenty of last June's graduates now interning from New York City to Florida. Every one of their many questions could have been answered at Saturday's meeting and identical ones were. I think this is a firm step forward in practical medical education and its continuance highly desirable."

George Tunnell M.D.

TPR diagnotes

REPORT OF PUBLIC RELATIONS COMMITTEE: Upcoming January 23 Presidents and Secretaries Conference should be of high interest. Important to note that meetings are becoming more popular each year – better attended. Third conference should surpass all previous. Program calls for morning and afternoon sessions – morning to cover operation of Texas Medical Association's key boards, councils, and committees, and afternoon session to offer latest report on VA medical care from national viewpoint. New added feature to this year's meeting will be "Hospitality Room" at Driskill Hotel. Room will serve as downtown headquarters both Friday and Saturday, January 22 and 23.

It is important that names of newly elected officers in county medical Societies reach central office promptly following election, so that they may be included in annual "Working Together" booklet. Also needed to correct Association mailing lists and in preparation for annual session meeting of House of Delegates.

Medical Students' Days at Houston and Galveston, December 11 and 12, enthusiastically received by almost 300 medical students from Baylor University College of Medicine and University of Texas School of Medicine. Meetings were held in cooperation with Galveston and Harris Counties Societies. Success of these meetings pointed out appreciation of students and need of such a project. Students' response on evaluation cards encouraging – mailed early after meeting.

Evaluations of meetings were interesting – recommendations for additions to programs ranged from "cost of setting up practice" to "more on ethics – I don't know what is really meant by fee-splitting." All agreed that programs were excellent. More stress on business side, legal aspects, and public opinion dominated requests.

Public relations program for 1954 now officially approved by Board of Trustees. Program stresses society interest and meeting attendance, strengthening lines of communication internally, "Medical Students' Days." On the external side: broadening of four-point program of last year.

ON THE NATIONAL SCENE: A joint project of American Medical Association Department of Public Relations, Bureau of Health Education, and Committee on Medical Motion Pictures makes available interesting TV programs for use of state and county medical societies on a public service basis. Films combine humor and fact with professional know-how to hold audience. Those interested should write central office in Austin.

Defense Department's proposed legislation for medical and other scholarships in connection with federal service is receiving final check before presentation to Budget Bureau for approval. Bureau approval is necessary if plan is to be presented as administrative bill – proposal can be offered by any member of House or Senate, however.

Essential provisions of plan: (1) Any medical, dental, nursing, or veterinary student accepting scholarship to be obligated for one year of federal service for each year of scholarship study. (2) School tuition to be paid direct – student expenses also to be covered. (3) Scholarships limited to four years and not open to premedical students or others preparing for professional courses. (4) Deans to make recommendations, but final selection by Department of Defense.

According to department spokesman, there are two objectives: (1) to meet military needs after expiration of doctor draft in 1955, if regular draft does not produce enough officers; (2) to interest young officers in regular military careers to maintain the corps at the necessary level. Current regular medical officers make up only 25 per cent of Medical Corps total.

Dr. W. L. Portteus, Indiana State Medical Association, has authored an excellent small brochure explaining fees and what they are based on for distribution to his patients. Brochure is based on answers to questions brought up by patients over many years. Those interested may get further details from central office.

National news on the home front: Ninth National Conference on Rural Health to be held in Dallas, March 4 through 6. Excellent opportunity to show Texas Medical Association's interest in improving health conditions in this predominantly rural state.

FROM OVER THE STATE: Interesting article in December Progressive Farmer by Dr. Chester Callan, Rotan, chairman of Committee on Rural Health of Texas Medical Association and member of Nolan-Fisher-Mitchell Counties Medical Society. Article is titled "TMA Works for More Rural Doctors" and is excellent public relations vehicle as well as enlightening report.

The Woman's Auxiliary statewide project to help overcome the distressing shortage of nurses received a boost from Cameron-Willacy Counties Medical Society, which has voted $150 yearly for the local auxiliary's nurse scholarship fund.

LIVING PRINCIPLES

Resolutions and a new year are as inseparable in the American mind as bread and butter. With the twelve months now beginning, perhaps no better resolution could be adopted by each American than the determination to *apply* the principles of government, economics, and social behavior to which most Americans automatically subscribe.

The men who framed the Constitution of the United States provided for a representative democracy based on broad participation by the citizenry. They set up checks and balances between the executive, legislative, and judicial arms of the federal government to keep one branch from usurping power. They provided for a system of free economic enterprise in which private property could be amassed by individuals from whom it could not be taken without due process of law; for free export and import of articles from state to state; and for a three-way system of economic control in which the free employer, the free worker, and the free customer counterbalance each other. Finally, a bill of rights to guarantee such freedoms as worship, speech, assembly, and press reports was made a part of the Constitution. Between its numbered paragraphs, although not in so many words, were the undergirding moral and ethical principles of the great religions, without which such a constitution could but fail.

Those who labored in Constitution Hall to draw up a document to shape the future of the new republic had doubts as to whether the people actually were capable of self-government. Benjamin Franklin said: "You now have a republic—if you can keep it." He and the others who earlier had penned the Declaration of Independence, in stating one inalienable right to be "the pursuit of happiness," recognized that happiness cannot be conferred, that happiness and security must be created by each who seeks it. This is still true.

Blessed as we are by being part of a land where great principles have been laid down, our greatest liability is lethargy and the perhaps un-

Poll Taxes Are Payable Before January 31

COLLEGE OF PHYSICIANS
OF PHILADELPHIA

conscious reluctance to accept these principles for application in our own individual situations.

We cannot have a government by the people unless we in Texas take the trouble to pay our poll taxes and then vote on election day. We cannot have individual freedom while condoning irresponsible name-calling or intolerance. We cannot apply one rule to "the other fellow" and another to ourselves.

The beginning of a new year should be a time of soul searching. If we are in earnest about believing in government of the people, by the people, and for the people; if we honestly think that free enterprise can bring greater goods and services to more people; if deep down in our hearts we have concern for all our fellow creatures—if we pay homage to such principles, let us resolve to live them in this year ahead.

JOURNAL ARTICLES INVITED

For years the bulk of the scientific articles published in the TEXAS STATE JOURNAL OF MEDICINE have been presented first on the program of the annual session of the Texas Medical Association. The typical annual session in recent years has yielded up to 100 essays, of which the majority have been published in subsequent issues of the JOURNAL. The 1954 annual session is being planned around a new format which will offer perhaps half as many papers for possible publication.

Mathematicians will conclude correctly that during the forthcoming year a greater opportunity than ever for acceptance of direct contributions to the JOURNAL will prevail. Nevertheless, it is not expected that the procedure of screening manuscripts or the high standards for acceptance will be modified.

The editorial staff and its advisers will be pleased in the next few months to review papers which were well received at a district or county medical society meeting or which were prepared especially for the JOURNAL. Suggestions for preparation of manuscripts may be obtained from the JOURNAL office upon request.

THE FIGHT CONTINUES

In 1953, Texans contributed more than $2,500,000 to fight poliomyelitis through the March of Dimes. The National Foundation for Infantile Paralysis is now staging its 1954 drive, January 2-31, to conquer poliomyelitis by raising money for personnel, equipment, facilities, and medical research.

Progress toward the conquest of the dreaded disease is being made, but at a terrific cost. Gamma globulin has been found to provide marked temporary protection against paralytic poliomyelitis and possibly to modify the severity of the disease during the late stages of the incubation period, but gamma globulin research must continue. More recently, a vaccine has been developed. Its effectiveness in preventing paralytic poliomyelitis will be tested in a mass vaccination project beginning in February. The estimated cost of $7,500,000 for this study will be financed by the national foundation.

Since 1938, when the national foundation was brought into being, 87 per cent of all March of Dimes collections in Texas has been used to care for patients in the state and only 13 per cent to assist in the national program.

To date, the National Foundation for Infantile Paralysis has given more than $200,000 in research grants to six Texas institutions, and the Southwestern Poliomyelitis Respiratory Center at Houston is one of six in the United States supported by March of Dimes funds. In addition, more than 3,000 scholarships and fellowships, forty-five to Texas residents, have been given by the national foundation.

Physicians have a wide scope of friends and acquaintances whom they can urge to support the drive as they themselves are doing. They can encourage their wives to join the Mothers' March on Polio, and their children can be useful in school drives. In addition, they can make every effort to learn more about the disease, its cause and cure, and do their share to halt poliomyelitis in the near future.

CURRENT EDITORIAL COMMENT

THE PHYSICIAN, CRIME, AND THE COURT

The medical profession has never been interested in the social and economic problems referable to crime. However, today it seems wise for us, as good citizens of the community and as members of a profession which must treat both the criminal and his victim without being influenced by either guilt or innocence, to acquaint ourselves with these problems.

It has been estimated that the national bill for crime is $28 billion; of this $20 billion is for gambling, $7.5 billion for organized crime including racketeering, and $500 million for conventional crimes. This is a multibillion dollar drain upon our national resources; the slogan "Crime Does Not Pay" apparently is not proving very effective. Statistics show that young people are major contributors to crime. In 1950, 30.5 per cent of arrests were of persons younger than 25 years of age. These youths were charged with 54.1 per cent of robberies, 61.6 per cent of burglaries, 45.4 per cent of larcenies, and 67.3 per cent of automobile thefts. Approximately one-half of the crimes against property were said to have been committed by members of this same age group.

The interest of lawyers in familiarizing themselves with medicolegal problems, as indicated by their participation in the law-science program sponsored by the Schools of Law and Medicine of the University of Texas, should be a challenge to the medical profession. A physician frequently has to appear in court as a witness on behalf of either the prosecution or the defense. Without knowledge of legal procedures he often is embarrassed by questions propounded by the opposing attorneys. He frequently does not take time to become familiar with the legal processes and medical problems involved before going on the witness stand. The results are not only embarrassment to himself but failure to convey to the jury a clear concept of the problems on which it is to render a verdict. Apparently it will be necessary for us, as physicians, to appear in courts more and more, and it behooves all of us to meet this responsibility by increasing our knowledge of legal procedure as it applies to expert testimony. Insufficient knowledge of the case, poor techniques in presenting testimony, and testimony by unscrupulous doctors will cause the public quickly to lose faith in the medical profession.

A few physicians as pathologists and toxicologists contribute to the solution of crimes. The great need today, however, is prevention of crime and institution of research to determine better methods of punishment. The medical profession is in a better position than any other group to contribute constructively to these programs. Such efforts must not be considered only in the fields of the pathologist and the psychiatrist. Malnutrition, disease, and physical defects are medical problems frequently affecting the lives of persons who are either criminals or potential criminals. It has been said that "the most inspiring experiment of modern times in criminology and penology is that proceeding at the new Federal Correctional Institution at Seagoville, Texas." (Seagoville is a "prison without walls" with a minimum of physical and mental barriers. There one finds an atmosphere relaxing, alert, purposeful, and calm instead of the usual one of tenseness, intrigue, repression, and regimentation.) Thus, we see that the seeds of research are growing in our state. As a profession, let us contribute our part in the cultivation of these efforts and actively assist in the development of sociologic programs aimed at the prevention of crime.

THE ANTICOAGULANTS

MARVIN DUNN, RAYMOND HENRY, JOHN RIBBLE, CHARLES SANDERS, and K. P. WALKER, Dallas, Texas

Under the Direction of Andres Goth, M. D., Dallas, Texas

UNTIL the past few years, the fight of the physician against thromboembolic disease has been based on two procedures, venous ligation and early ambulation. These devices have met with only limited success because of the widespread basic dysfunction in the vascular tree. Thromboembolic diseases are based on a number of interrelated factors,[56] among which are (1) generalized lesions of the vascular tree; (2) pressure changes and rate of blood flow; (3) characteristics of the formed elements; and (4) coagulability of the plasma. All these are so balanced as to cause the blood to remain fluid in its channels and also to prevent extravasation of fluid from the capillary network. Any interruption of this in a positive direction likely will result in intravascular thrombosis, while tilting the balance the other way might well prevent such phenomena.

Indeed, there now are available to the medical profession such anticoagulants which may be used in thromboembolic disease. A group of Scandinavian workers in 1935 were the first to present clinical data that such drugs were of definite therapeutic use.[33] Led by Jorpes, these clinicians administered anticoagulants to some 900 patients, 138 of whom they claimed would have died without their use.

There is one factor which must be considered in the administration of anticoagulants. Improperly controlled therapy will lead to hemorrhage. The incidence of such bleeding ranges from 0 to 33 per cent of all cases treated with anticoagulants.[56] However, as research progresses, an understanding of the various drugs has come about with subsequent alterations in the mode of treatment. The main guide in all therapy is based on the calculation of coagulation and prothrombin times. It is well to mention that prothrombin time is used only in patients being treated with drugs affecting liver function—for example, Dicumarol—while clotting time is instrumental in determining the action of such drugs as heparin.

Clotting time is measured by a number of methods including: the Lee-White, the Howell, and the capillary methods. They are all based on the same four factors: (1) the sample should not be contaminated with tissue substance; (2) clean glassware should be used; (3) room temperature should be optimal for determination; and (4) consistent amounts of trauma and surface contact should be exerted on every part of the sample, if any degree of accuracy is to be achieved. Prothrombin is a plasma protein chemically behaving as a euglobulin. Its production is thought to be solely in the liver, with vitamin K playing an important role in its manufacture. Activity of this protein is determined by taking oxalated plasma and adding relatively large amounts of ionized calcium and thromboplastin.[45] In this way all the clotting factors are in excess with the exception of prothrombin, and the clotting time then is a reflection of the prothrombin concentration. This test is often performed on diluted plasma (usually 12.5 per cent), since this adds greater sensitivity to the reaction with accordingly more accurate results.[2]

Proper treatment requires an understanding of the coagulation mechanism. Although there is a great deal of controversy over the various factors involved, the Quick theory, for the sake of expediency, will be discussed herein, since it provides the necessary framework in explaining the physiologic action of these drugs. Quick postulated that some damage to the endothelium causes lysis of the platelets, liberating probably thromboplastinogenase, which reacts with a plasma factor, probably thromboplastinogen, to form thromboplastin. This product added to ionized calcium, accelerator globulin, and prothrombin results in thrombin, an enzyme which allows fibrinogen to form fibrin. Thrombin also causes lysis of platelets and, thus, the cycle repeats itself.

The concept of treating thromboembolic disease by employing methods which afford diminished coagulability represents a physiologic approach to the problem. Indeed, it may even be considered an attack on the etiologic agent, though truly this would involve elimination of the factor responsible for the disease. Nevertheless, this approach seems to be the most desirable, for the more closely a therapeutic effort fits into the body physiology, the greater the chance for its success without toxic effects.

The authors are students at Southwestern Medical School of the University of Texas and prepared the article under the direction of Andres Goth, M. D., professor of pharmacology.

The relationship between coagulability of blood and thrombosis is not clear. Similarly, the mechanism of anticoagulant action is obscure. Anticoagulants seem to act in one of the following ways:[54] (1) decreased metabolic production of a coagulant; (2) increased metabolic production of an anticoagulant; (3) direct inactivation or destruction of a clotting factor; or (4) release of a stored anticoagulant. Though it is thought that Dicumarol (one of the major anticoagulants) acts to decrease metabolic production of a coagulant and that heparin (a second major anticoagulant) produces direct inactivation or destruction of a clotting factor,[4] there is no conclusive proof that these are the only important actions of these drugs. Much still is unexplained, and the avenue of investigation is the only road to such knowledge.

Therapeutic indications for the anticoagulants in general are (1) acute thrombophlebitis; (2) phlebothrombosis; (3) recurrent thrombophlebitis; (4) pulmonary and peripheral thromboembolism; (5) prophylaxis to prevent thromboembolism postpartum, postoperatively (particularly in pelvic surgery), and when threatening thrombosis is suggested by hypercoagulability and previous history of thrombosis; (6) coronary thrombosis and myocardial infarction; and (7) diseases with multiple small vessel thrombosis.[56]

HEPARIN

Heparin was discovered accidentally[34] by Jay McLean of Johns Hopkins University in 1916 while he was working with William Howell. It was first isolated from heart and liver[34] and given the name of heparin in 1918 by Howell and Holt[28] because of its abundant occurrence in the liver. By 1924 Howell had so purified the product that 1 mg. would prevent coagulation of 40 cc. of cat blood at 0 C. for twenty-four hours.

Heparin is a normal physiologic compound found in the metachromatic granules of the mast cells of the body[35] and is particularly abundant in the liver and lungs. These cells are located near blood vessels and capillaries, and the contents of the granules can be emptied directly into the blood stream.[35] The heparin structure is that of a mucoitin polysulfuric acid with a disaccharide repeating unit in the molecule. The molecular weight is in the neighborhood of 17,000.[35] Heparin is one of the body's most acidic substances,[3] but mild activity causes the molecule to lose its anticoagulant activity.[54] It carries amino groups with strong negative charges[54] which are essential to its activity.[53]

Heparin is not absorbed from the gastrointestinal tract and is not effective if administered sublingually.[43] Intravenous, intramuscular, or subcutaneous injections are the only effective means of giving the drug. Repository forms and intravenous drip have been used to circumvent the usual rapid disappearance of the drug from the circulation.

Heparin is probably inactivated by an enzyme,[54] since it is eliminated so rapidly, but it is also excreted in the kidneys to some extent as uroheparin.[7] This may be of only slight importance as it has been shown to disappear just as rapidly in nephrectomized animals.[6] The extent of a heparin-inactivating enzyme is unconfirmed, but heparin-protein inactivating complexes have been described,[4] though also unconfirmed. It has been proposed that body resynthesis of thromboprotein removes heparin, thus eliminating excretion, enzymes, and protein complexes as routes of dissipation.[4] The use of carinamide to reduce tubular excretion by the kidneys has been shown to increase the duration of heparin action.[41]

Deposits of heparin have been found in the liver, lung, spleen, and kidneys of experimental animals.[54] However the main supply remains in the blood.

The exact mechanism of action of heparin has not been established fully, but it is known that it acts before fibrinogen can proceed to fibrin in the clotting process. It has been shown to act at three points: (1) blocking the activation of prothrombin, probably through a plasma cofactor;[51] (2) acting as an antithrombin, also most likely through a plasma cofactor;[26] and (3) producing a decrease in platelet number[54] and preventing their agglutination,[51] possibly through the action of the first two mechanisms.[54] These effects on the blood clotting process produce prolonged clotting times.[32] One theory for the action of heparin is that by combination in the tissues with a thromboprotein and lipid substance, the heparin releases another factor which has been shown to be a powerful anticoagulant.[4]

Other actions of heparin include its having detoxifying effects on digitalis, cobra venom, and Congo red;[19] causing the clustering of chylomicrons and the packing of red blood cells after a heavy fat meal, resulting in a decreased sedimentation rate and hematocrit level;[61] inhibiting the action of hyaluronidase;[62] producing profound effects on low density lipoproteins in blood, resulting in low blood levels of these compounds and retarding the development of atherosclerosis in experimental animals;[24] and relieving markedly the pain due to angina pectoris far beyond its effective anticoagulant duration of activity.[24] No fibrinolytic activity for heparin has been proved.[9]

Heparin probably is released normally from the mast cells in anaphylactic shock,[23] during stress reactions,[5] and after irradiation,[64] resulting in a prolonged clotting time.

The action of heparin is effective in five to ten minutes following administration of moderate doses

and is dissipated completely within six hours.[30] The duration of the action is proportional to the dosage, but the compound is so effective that doses prolonging the action beyond six hours are dangerous in the first hours of administration.[30]

All toxic effects are due to extension of the physiologic actions of the drug. Large doses are not toxic, nor do they affect wound healing.[33] The only danger is that of hemorrhage or hematoma at the site of injection.[60] Some cases of severe sensitivity to heparin on first injection have been reported, but usually sensitization takes place gradually. Such reactions may be due either to the heparin or impurities. Test doses should be used on persons with allergic tendencies.[23]

Quantities as small as .1 micrograms of heparin will cause a slight increase in the prothrombin time.[4] Heparin achieved official status on November 1, 1950, with the USP unit described as the quantity of heparin sodium required to keep 1 cc. of plasma in a fluid state. The USP standard of potency is a minimum of 100 USP units per milligram.[17] Biologic methods of assay are necessary at the present time. The purified heparin sodium in 1 mg. quantities will prevent clotting for twenty-four hours in 500 ml. of cold cat's blood.

The determination of clotting time long has been accepted as the basic method for testing the action of heparin on the blood. However, determination of plasma antithrombin levels recently has been prescribed as a better test in this evaluation.[27] Dicumarol and Tromexan, other common anticoagulants, have no demonstrable effect on the blood antithrombin levels. It is said that only approximately 15 per cent of United States hospitals have laboratory facilities for the accurate testing of blood in patients receiving anticoagulant therapy.

Dependence on the body weight as a guide to dosage has been shown to be grossly inaccurate.[42] Test dosages should be given and coagulation time or some other suitable determination made to test the dose effectiveness. Usual therapeutic doses consist of 50 to 100 mg. injected intravenously every four to six hours.[48] Therapeutic increases in clotting time, which by the Lee-White method is five to ten minutes, are considered to be three to six times more than the normal level. The main disadvantage of using heparin lies in its cost, which is about $9 per day usually.

Sterile solutions of heparin sodium with varying strengths for intravenous use, sterile preparations with repository adjuvants (procaine and butacaine) to prolong the effect intramuscularly or subcutaneously,[44] and sterile preparations with vasoconstrictors and repository adjuvants combined still further to prolong effects of heparin are available commercially. The latter preparation may prolong the effect for as long as seventy hours.[54] The commercial products all are extracted from animal tissues.

The principal conditions in which this drug is contraindicated are subacute bacterial endocarditis, hemorrhagic diathesis, increased capillary fragility, purpura, bleeding lesions, and heparin sensitivity. It should never be used in cases which cannot be kept under careful observation for hemorrhage, or when clotting time determinations are not readily available.

Heparin is rapidly neutralized by protamine[45] in approximately equal amounts and by toluidine blue.[54] Aureomycin reduces the concentration of heparin in serum and increases the coagulability of the blood by some antiheparin activity.[64] Local anesthetics also will precipitate heparin.[39]

DICUMAROL

The story of Dicumarol began in North Dakota in the winter of 1919-1920 when cattle were dying of a mysterious hemorrhagic disease. Roderick and Schofield showed in 1928 that the etiologic agent of the disease was in the spoiled sweet clover ingested by the cows.[50] These men also showed that the prothrombin activity was decreased tremendously. Link and his associates undertook in 1933[56] to isolate the anticoagulant responsible for the disease. It was they who established that 12.5 per cent plasma was best suited to the study of drug action on the prothrombin time.

Campbell in 1938 isolated the first crystals of the compound which was identified in 1940 as 3,3′ methylenebis (4-hydroxycycoumarin) (fig. 1). This discov-

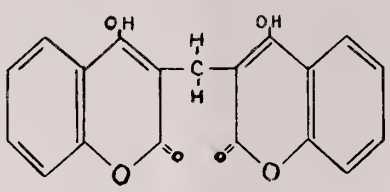

FIG. 1. Chemical structure of Dicumarol.

ery produced a relatively economical, effective anticoagulant which was destined to play an important part in anticoagulant therapy.

Dicumarol is absorbed from the gastrointestinal tract slowly, maximal absorption occurring at six hours after ingestion and complete absorption at twenty-four hours. The drug passes into the plasma, where it is bound to the plasma proteins, and its effect on prothrombin activity is first noted some eight to twenty-four hours after administration.

The effect of the drug lasts from twenty-four to forty-eight hours after the first decrease in prothrombin activity. Salicylic acid has been shown to be a degradation product of Dicumarol. This mechanism is obscure, but an enzyme system is thought to be

chiefly responsible. Other metabolic products of Dicumarol still are unknown, and all these are thought to be excreted through the urine and feces. Conflicting evidence exists as to the urine excretion of Dicumarol per se.[25] Hausner and others have demonstrated the molecule in the urine of rats. The molecule has been shown to be present in the liver, kidney, and lungs in the highest concentrations. The plasma Dicumarol concentration is higher than that of any tissue, although the unbound concentration is low.[56]

No certainty can be attached to the mode of action of Dicumarol. The fact is well known, however, that prothrombin concentration is diminished with Dicumarol administration. Quick believed this to be a competitive inhibition phenomenon in which Dicumarol replaces vitamin K as the prosthetic group in the enzyme responsible for the prothrombin production.[47] Another theory is that Dicumarol influences the production of altered prothrombin.[37]

In addition to its effect on prothrombin, Dicumarol also decreases the formation of accelerator globulin early in treatment;[20] increases or decreases fibrinogen level, depending on the dosage;[29] may act to inhibit the activity of obscure clotting factors; and in vivo can inhibit the adhesiveness of platelets.[65]

Most of the effects of Dicumarol overdosage are due to hemorrhage, with hematuria being the first sign of bleeding.

Dogs poisoned by Dicumarol showed, besides hemorrhage, toxic lesions of the small vessels, acute glomerular swelling, and toxic lymphoid tissue reaction.[15] It is to be emphasized that in man and animals no liver damage has ever been proved when only therapeutic doses have been given.

The responses to Dicumarol are far too varied to allow one to follow an empirical dosage chart.[56] Link said: "We never administer the anticoagulant without determining the prothrombin level... when I learn that a clinician has induced a frank case of hemorrhagic sweet clover disease of cattle in man, my usually buoyant spirits are bruised." Maintenance dosages are likewise determined from prothrombin levels. It is well to mention that the optimal prothrombin level sought in such treatment is still a center of tremendous controversy, and no definite statement regarding this will be made in this paper.

Dicumarol is prepared in capsules and in powdered form for oral administration.

The most important contraindication for its use is in liver disease. If damage is known to exist, therapy must be guarded. Active bleeding from any source is always a contraindication for anticoagulants in general.

Cases of subacute bacterial endocarditis usually are not treated with anticoagulants, since their use may prevent reinforcement of vascular wall injury by an organizing thrombus. Rupture of the vessel wall and perhaps fatal hemorrhage may result from such treatment.[56] Some avoid use of Dicumarol in renal disease, but as yet the evidence is inconclusive.

Vitamin K is the most useful antagonist of Dicumarol, since it may return blood prothrombin levels to a near normal level in twelve to twenty-four hours. There is considerable debate over the exact types of vitamin K most effective in combating hemorrhagic states caused by Dicumarol. Most types have proved effective, although massive doses may be required. The mechanism is probably that of displacement of Dicumarol in the prothrombin enzyme.[47] It is to be noted that vitamin K administration does not affect blood levels of Dicumarol.

Transfusion of whole blood is considered good therapy in combating Dicumarol overdosage.

Methyl xanthines antagonize the action of Dicumarol, though the mechanism is not clear.[52] When they are given with Dicumarol, the effect of the latter is strongly suppressed.[56]

COMPOUNDS RELATED TO DICUMAROL

Dicumarol has many related compounds, although none seem to be as effective as it is.

Phenylindandione has the advantage of reducing the prothrombin blood level for the first two or three hours after administration,[31] but this effect is only temporary; the main effect results some twenty-four hours after administration, and its similarity to Dicumarol coupled with some toxic side effects make this drug undesirable.

Compound 42 was studied by Link and his associates with the idea in mind that here might be a good anticoagulant. It was soon found to be an excellent rat killer because of its hemorrhagic phenomena. In fact, it is one of the best, since it is almost completely specific for rodents.

TROMEXAN

The compound known as Tromexan was synthesized by Rosicky by weakening the methylene linkage of Dicumarol and adding a carboxyl radical. This was done in an effort to improve the absorption of Dicumarol, assuming that the difficulty was in the splitting of the coumarin molecule. The result was a new anticoagulant having certain favorable properties.[14]

The structure for Tromexan is 3,3′-carboxymethylenebis (4-hydroxycoumarin) ethyl ester (fig. 2).

This compound is completely absorbed from the gastrointestinal tract in most persons.[12] The magnitude and time of the peak level of Tromexan in the plasma is variable, but is generally achieved in one to

six hours after administration. Dicumarol reaches its peak in twelve to thirty-six hours.[12, 14] Tromexan is not excreted in the urine, but several of its metabolic products are.[12, 14] Renal insufficiency still is a contraindication to Tromexan, even though the hyperreactivity in such subjects cannot be explained on the basis of decreased excretion.[12, 13] It is not extensively localized in tissues relative to plasma. The decline in the level of Tromexan in plasma after intravenous injection is rapid—about 25 per cent per hour. The

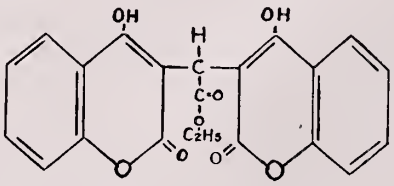

FIG. 2. Chemical structure of Tromexan.

Dicumarol level in plasma declines under the same circumstances at about 40 per cent per day. The actual rate, however, varies from individual to individual, but each person has a distinct pattern. As is true of both Tromexan and Dicumarol, the rate of decline in plasma level is inversely proportional to the dose; the larger the dose, the slower the decline in plasma level.[12]

The mode of action for Tromexan is essentially the same as for Dicumarol. There is little correlation between persistence of the drug in the body and peak prothrombin response. Peak plasma levels of Tromexan also are correlated poorly with prothrombin response.[12] Giving repeated doses of it will cause a cumulative effect on the prothrombin level, even though the drug remains in the plasma for only a few hours after administration. Dicumarol still has a high plasma level when the prothrombin time begins to respond.[12] On discontinuation of Tromexan therapy, an average of one to two days elapse before the prothrombin time returns to normal. With Dicumarol, this time is about four days.[12, 14, 58] Clinical trials have shown that when comparable prothrombin levels are maintained, Tromexan is as effective as Dicumarol.[13, 14, 63]

This compound is one-fifth as potent as Dicumarol, but has only one-twentieth the toxicity. Vitamin K and transfusions are used to combat overdosage, as with Dicumarol.

Tromexan therapy is difficult to control because of the rapid and sometimes unpredictable changes in prothrombin time, even when regular daily doses are given. In general, however, a daily determination of prothrombin time will reflect the effect of the previous day's medication, so that dosage may be altered accordingly.[12, 13, 14, 58] These dosages may vary with the individual patient. Split doses have been found to avoid much of the fluctuation in prothrombin levels.[12, 13, 14, 58] In general, an initial dose of 900 to 1,200 mg. is given, followed by a daily maintenance dose of 300 to 600 mg. The drug is packaged as uncoated scored tablets of the pure compound.

Grossly, Tromexan has the same indications, contraindications, antagonism, and method of administration as Dicumarol.

SALICYLATES

In early reports salicylates were described as the etiologic agent of hemorrhagic phenomena in salicylate-treated patients.[18] Investigation has shown them to be degradation products of Dicumarol, and this has prompted further work in the field.[6] The mechanism of action centers around the reduction of prothrombin in the blood.[19] Field has shown that, as in Dicumarol antagonism, vitamin K will raise the blood prothrombin level in salicylate overdosage.[22] It is now standard treatment to give the vitamin in all cases in which large doses of salicylates are used. In many countries where malnutrition and starvation are rampant, cases of hemorrhagic disease due to salicylate ingestion are commonplace, and in these places particularly, vitamin K is indicated.

The mechanism of action is still unknown and consequently is a center of controversy. Field, Spero, Link, and others[22] stressed their belief that salicylates act only when vitamin K function is impaired, and that these agents have a low affinity, compared to Dicumarol, for the site of vitamin K action. However, the evidence is inconclusive, and until further proof is gathered, salicylate action will remain a mystery.

ALPHA-TOCOPHEROL

The action of alpha-tocopherol (vitamin E) on coagulation is interesting, but of no practical value in man as yet. Three main effects have been demonstrated: (1) It acts as a vitamin K–like substance, since vitamin E deficiencies cause hemorrhagic states in experimental animals.[54] (2) It acts as an antithrombin, preventing the formation of fibrin from fibrinogen.[21] (3) It has been shown to have antithromboplastic activity.[36] Since these actions have been demonstrated only experimentally in laboratory animals, the use of vitamin E as a therapeutic agent in man is yet to be determined.

SULFONAMIDES

Sulfonamides affect prothrombin levels of the blood much the same as Dicumarol. However, their action is thought to be on the bacteria in the gastrointestinal tract, which play an important role in vita-

min K synthesis.[11] Administration of vitamin K in conjunction with sulfonamidex therapy will decrease the likelihood of hemorrhage.

ANESTHETICS

Anesthetics like chloroform are notorious for causing liver damage, which results in reduction of blood prothrombin and fibrinogen levels. Recovery usually occurs in about a week, with both levels returning to normal.

TRYPSIN

A new and possibly revolutionary drug has now come into limited use. This is trypsin. First crystallized by Northrup, it is a protein with a molecular weight of 35,000, containing aspartic and glutamic acids, arginine, and lysine. The Armour Laboratories have perfected a highly purified crystalline trypsin called Enzar, upon which many studies have been made.

$L.D._{50}$ studies have shown a tremendous species difference; for example, $L.D._{50}$ for guinea pigs is 80,000 Armour units per kilogram of body weight; for mice 40,000 Armour units per kilogram; for rabbits 5,000 Armour units per kilogram; and for cats 4,000 Armour units per kilogram. These studies were based on rapid infusion and high drug concentration. When trypsin was administered in a concentration of 3,000 Armour units per cubic centimeter at a rate of 6 to 10 drops per minute, rabbits tolerated 250,000 units and dogs, 1,250,000 units with no ill effects. It is evident that concentration and rate of infusion are keys to the problems of administration.

A circulating trypsin inhibitor has been found to combine with 97 to 99 per cent of the trypsin to form a stable, irreversible compound. Some 1 to 3 per cent of the trypsin remains free to act. However, the action of the trypsin inhibitor is depleted accordingly by the chemical combination, and this may be of some clinical importance. In such diseases as pneumonia, typhoid fever, rheumatic fever, tuberculosis, hyperthyroidism, malignancies, and anemias, trypsin inhibitor levels, along with fibrinogen levels, rise. Since Enzar reduces these trypsin inhibitor and fibrinogen levels, it seems that administration of Enzar provides a method which alters the natural history of a disease.

The specific action of trypsin is based on the hydrolysis of circulating proteins and their products—fibrin, prothrombin, fibrinogen, thrombin, globulin, and albumin in that order. Thus, in the presence of a fibrinous clot, trypsin acts to dissolve the clot. If no fibrin is present, 300 units of the drug in 20 cc. of blood will result in clotting; but if 400 units are added to another 20 cc. of blood, the latter will be incoagulable. At first this would seem to be an almost hopeless dilemma, but upon closer inspection, it is seen that all available trypsin was utilized in the first tube to convert prothrombin to thrombin. In the second 20 cc., there was an excess of the trypsin, and this caused fibrinogenolysis. Thus no clotting occurred. Had fibrin been present originally, the drug would have acted to form a soluble polypeptide from the fibrin, with digestion of the clot resulting. It is well to note that extreme caution has to be used in administering this drug, since small changes in concentration cause such varying results.

A problem is posed by the formation of the polypeptide from the fibrin. Increased vascular permeability and, perhaps, some intestinal spasm result. Because antihistamines decrease vascular permeability, it has been postulated that they should be used along with trypsin.

Trypsin also activates fibrinolysins by conversion of profibrinolysins, but one of the most important actions is on the individual blood cell. Tryptic action on surface protein elements causes increased volume, increased mechanical fragility, and increased osmotic fragility of the red cell. Also, the red cell becomes agglutinable, but the presence of a reverser substance, for which the cell manifests the stronger affinity, erases this as a clinical problem. All these actions on the cell affect the oxygen carrying capacity in such a way as to contraindicate the drug in congestive failure. Cyanosis also has been reported, and it has been explained on a basis of methemoglobinemia. Leukocytes are affected by action on surface proteins also.

The study of trypsin is far advanced in experimental animals, but the greatest test of all, the one on man, has not been adequately made. Until this drug has been used thousands of times with excellent results, judgment must be reserved.

SUMMARY

This paper has served to acquaint the reader with a knowledge of anticoagulants, their uses, and their successes. But it is to be stressed that they are no panacea for thromboembolic disease. There are those who would say anticoagulants are the answer; there are others who would as dogmatically state they are useless. Between these two lies the investigator who would be as the politician and tread the middle of the road. Herein may lie the most ideal approach to this drug therapy. Anticoagulants have been used extensively, but they are still young as a group and still growing in number. The pharmacologist and the clinician will have to study this problem a great deal further before a definite conclusion can be reached.

Experiences with Long-Term Anticoagulant Therapy

H. B. EISENSTADT, M.D., and B. B. ELSTER, M.D.
Port Arthur, Texas

THE value of anticoagulant therapy in thromboembolism has been proved, without doubt, by numerous investigators in this country and abroad. The treatment has been confined mostly to the acute thrombotic diseases and embolic complications. However, there is a large group of patients in whom the danger of thromboembolism may be present for a period of months, years, and even a lifetime. In such cases the prolonged use of anticoagulants appears logical as a prophylactic measure. The general recognition of the value of such treatment has been greatly hindered by fear of their toxicity, which is unwarranted because the untoward reactions encountered are due more to mismanagement than to the dangerous properties of the drugs. The literature discussing the value of prolonged anticoagulant treatment is sparse; however, Wright,[6] Nichol,[4] and Shapiro[7] have reported favorably on this subject.

A similar opinion was expressed by us in a previous publication.[3] Since that time our group has been expanded to include 78 patients who have now been observed over a period of up to five years. It is the purpose of this presentation to elaborate on our further experiences with such therapy.

The minimum of two months' treatment was arbitrarily selected for the inclusion of cases in this group. During the time of the study, a considerable number of persons received anticoagulants for a lesser period; they either were considered to be unsuitable or refused such prolonged therapy.

METHODS AND COMPLICATIONS

Successful and safe long-term anticoagulant therapy first must entail certain basic principles: (1) a trustworthy patient and family who will follow explicitly directions as to dosage and as to the need to observe carefully the early signs of intoxication should they develop; (2) a reliable laboratory with well trained technicians who are able to perform the prothrombin test with a minimum of error; (3) a physician who understands thoroughly the indications, contraindications, dosage, and toxicity of the drugs. Although hospitalization is desirable for acutely and seriously ill patients, it was not considered necessary in our average case. In many persons the treatment was started while they were at home; the majority were entirely ambulatory from the onset. Practically all patients of our series were able to continue their usual activity whether it be a trade, a profession, or household duties.

At the beginning of the anticoagulant therapy a graphic chart was prepared for each patient and continued during the entire time of his observation. This chart showed the prothrombin time in seconds, the percentage of prothrombin depression, and the daily dose of anticoagulant administered. The Link-Shapiro modification of the Quick prothrombin method was used in this study. Special precautions were taken to standardize the technique and to eliminate errors as much as possible. Each new batch of thromboplastin (Simplastin*) was compared carefully with the previous one to assure uniformity of action. Little variations from the normal standards were encountered during the entire time of observation. The normal prothrombin time ranged from 13 to 15 seconds. The identical method of prothrombin determination was used for hospitalized patients to make the transition to home care safe and simple. Blood tests initially were performed daily, then every three to four days, and after a short time once a week. Finally, when the patient's prothrombin level had become stabilized, the tests were done only every two weeks and occasionally even at longer intervals, but usually the two week schedule was followed rigidly.

The ideal drug for prolonged anticoagulant treatment should be administered orally, be well tolerated by the gastrointestinal tract, be without toxic effect on the parenchymal organs, depress the prothrombin level evenly for prolonged periods, be easily neutralized by available antidotes, and be relatively inexpensive. Heparin and its derivatives are not suitable for prolonged anticoagulant therapy for obvious reasons. Tromexan also is not too useful for this purpose because of its transient effect which causes wide swings of the prothrombin time and necessitates frequent blood tests. Phenylindandione resembles Tromexan in its action but the effect is more prolonged. Both Tromexan and phenylindandione should be given twice daily for their optimum action. This is more cumbersome than Dicumarol and Cumopyran administration, which requires only daily dosage. Dicumarol still appears to us at this time to be the drug of choice for prolonged anticoagulant therapy. Cumopyran is almost equally useful for this purpose; however, the prothrombin depression is more difficult to maintain and the effective dosage is more variable. Therefore, the drug requires more careful supervision, especially during the initial period of treatment. It has been used only when patients became resistant to Dicumarol.

*Chilcott Laboratories.

There is no need for indiscriminate change from one anticoagulant preparation to another. It is much safer to restrict oneself to one or two drugs and to prescribe them only in one size tablet or capsule. In our group of patients, 50 mg. of Dicumarol or 25 mg. of Cumopyran tablets were used exclusively.

Our graphic chart proved helpful for the calculation of the dosage. Immediately after each prothrombin test the total dosage for the following period was calculated on the basis of the previous amount administered, the change of the prothrombin time, and the tendency to further prothrombin depression or elevation; this quantity was then evenly divided into daily doses. The patient was instructed to write the number of tablets or capsules prescribed for each day on a calendar and to mark it off after taking the drug. The total dosage of Dicumarol varied from 0 to 100 mg. daily and 200 to 700 mg. weekly, and that of Cumopyran from 0 to 75 mg. daily and 100 to 500 mg. weekly. So far none of the patients has become resistant to both drugs. In case this should happen a shift to phenylindandione probably would be attempted. It is usually stated that menstruation, febrile diseases, and various drugs such as aspirin, digitalis, and antibiotics influence the prothrombin time, necessitating a change of anticoagulant dosage. This has not been brought out in our series. Fluctuation of the prothrombin level does occur for obscure reasons but is not related to the above mentioned factors.

Usually the earliest sign of anticoagulant toxicity is microscopic hematuria, followed later by gross bleeding from the kidneys and by subcutaneous hemorrhages. Gastrointestinal, respiratory, and intracranial hemorrhages have been reported in severe prothrombin depression. However, in the presence of coexisting disease, such as peptic ulcer, diverticulosis, coryza, bronchiectasis, tuberculosis, and encephalomalacia, the former complications may occur even with small doses of anticoagulants. We have observed several cases of epistaxis and hemoptysis in the presence of infections of the upper respiratory tract. One patient with a history of a traumatic olecranon bursitis developed a hemorrhagic effusion in this bursa. Another patient, with an endocervical carcinoma, experienced metrorrhagia. From such observations the contraindications to anticoagulant therapy is self-evident. In addition to various hemorrhagic states, such as occur in hepatic and renal disturbances and in blood dyscrasias, the existence of any lesion that may bleed is a contraindication to such therapy. However, under certain circumstances these toxic effects will have to be balanced against the dangers of thromboembolism.

The bleeding tendency is best counteracted by vitamin K_1 (Mephyton*) given in a dose of 25 to 50 mg. intravenously and repeated as indicated by the prothrombin level. Other vitamin K preparations are relatively ineffective. Modest dosage of vitamin K_1 is advisable to prevent the shortening of the prothrombin time below the pretreatment value. This has occurred in our experience contrary to previous reports denying this possibility. Smaller doses of vitamin K_1 also will avoid the development of refractoriness to anticoagulants. Blood transfusions are ordinarily not needed since the introduction of vitamin K_1.

Apart from the hemorrhagic manifestations the toxic symptoms of Dicumarol and Cumopyran have been mild. There were no adverse effects upon the hematopoietic, hepatic, and renal functions. A future communication will deal with these in greater detail. Individual doses of Dicumarol exceeding 150 mg. sometimes produced nausea, indigestion, and lightheadedness. For this reason the drug was administered daily in small amounts instead of every few days in larger quantities as recommended by Shapiro.[8] In none of our cases did the drug have to be omitted or reduced because of such effects.

INDICATIONS

Not considering rare disorders such as essential thrombophilia, hepatic vein thrombosis (Budd-Chiari), thrombotic obstruction of the abdominal aorta (Leriche), and pulmonary hypertension due to recurrent embolization (Ayerza's syndrome), prolonged anticoagulant therapy should be considered in three groups of diseases: (1) chronic, recurrent, and migratory peripheral thrombophlebitis; (2) cardiac diseases with intracardiac, coronary, pulmonary, and systemic thromboembolism; and (3) cerebrovascular thromboembolism.

Peripheral Thrombophlebitis.—One of the most common complications of posttraumatic, postoperative, and postpartum states as well as medical disorders requiring prolonged bed rest is peripheral phlebothrombosis and thrombophlebitis with or without pulmonary embolization. It has been stated by Wright[9] that "patients who have had one pulmonary embolus, if untreated, have a twenty per cent chance of death from subsequent pulmonary emboli." Therefore, anticoagulants are generally accepted as the treatment of choice should such phenomena occur. However, there is no agreement about the duration of such therapy. Unfortunately, no clinical criteria and laboratory tests are available that would indicate when the danger period has passed. For this reason it seems advisable to give the drugs for several months instead of a few weeks, especially in persons with persisting obstruction of the venous blood flow or in those with disorders favoring blood coagulation. It is also possible

*Merck & Co.

that such therapy will contribute materially to the complete restitution of the normal circulation because it may hasten the disintegration of the blood clot.[9] If thrombophlebitis recurs or migrates, there is certainly an indication for the long-time administration of the anticoagulant drugs provided that Buerger's disease, malignancy, and blood dyscrasias are not present. In the latter conditions the drugs are useless and perhaps even contraindicated. Finally, there is a group of persons with peripheral edema, varicose veins, ulcers, and eczema who are considered to have residual venous insufficiency while actually having a persistence or recurrence of the thromboembolic disease. Such persons complain of pains and cramps in the legs, spells of fever, cough, and expectoration. Clinical examination may show localized phlebitis, recent or past pulmonary infarctions, accelerated blood sedimentation rate, and elevated white blood cell count. In such cases the prolonged anticoagulant therapy will have the most gratifying effect.

Cardiac Disease with Thromboembolism.—The occurrence of intracardiac, pulmonary, and peripheral thromboembolism constitutes one of the serious complications of various heart diseases mostly in the presence of congestive heart failure. Fortunately, this does not occur frequently enough to warrant routine anticoagulant treatment; however, under certain conditions, for example in mitral stenosis with auricular fibrillation, the incidence of clotting phenomena and embolism is great, especially if one episode already has occurred. It has been estimated that the recurrence rate after two attacks of embolism is almost 100 per cent.[10] Under such circumstances the introduction and maintenance of a hypocoagulable state is indicated as long as such a danger period persists.

The value of anticoagulants in acute myocardial infarction is firmly established by the reports of the Committee on Anticoagulants of the American Heart Association. In our series, Dicumarol therapy, once started, was continued indefinitely, whenever possible, with the purpose of lessening the chances of future coronary thrombosis. Such prolonged treatment is especially justified if a history of previous coronary occlusion or pulmonary or systemic embolization exists, or if angina pectoris, congestive heart failure, or cardiac aneurysm develop after the acute attack.

The use of prolonged anticoagulant therapy in selected cases of coronary insufficiency, although not universally accepted, has proved to be of definite value in our estimation. This opinion is shared by other groups of investigators.[4, 6, 7] Such treatment has been given only to patients whose anginal attacks were severe, sustained, or frequent or had other characteristics of impending infarction. A decrease or disappearance of pain was observed in practically all cases following this therapy, even in those who previously had failed to respond to the conventional drugs. The mechanism of such action of the anticoagulants is not clearly understood. A vasodilating property and a promotion of the coronary blood flow has been suggested.[5] The treatment in some patients has been maintained continuously for forty months without any deleterious effect, nor has anyone in this group developed an acute myocardial infarction.

Cerebrovascular Thromboembolism. — Apart from the prevention of cerebral emboli, following various cardiac diseases, anticoagulants are useful in certain cases of cerebrovascular thrombosis. In recent years the diagnosis of chronic progressive occlusion of the carotid, vertebral, and basilar arteries has been made more frequently on the basis of clinical signs, symptoms, and angiography.[1] In such cases the use of Dicumarol and related drugs seems to be logical. The acute cerebrovascular accident so common in clinical medicine is frequently due to a thrombus involving one of the smaller vessels of the brain. The use of anticoagulants in this condition must be introduced only after the presence of cerebral hemorrhage is ruled out. Unfortunately, the distinction between the two entities is extremely difficult, irrespective of the various symptoms and signs generally mentioned in the differential diagnosis. Therefore, the use of Dicumarol in cerebrovascular diseases carries a greater risk than in other vascular occlusions. However, anticoagulants have shown gratifying results in patients with recurrent attacks of cerebrovascular thrombosis.

RESULTS

The results of prolonged anticoagulant therapy are difficult to evaluate because of the great variations in the course of thromboembolic diseases. Furthermore, this treatment requires close medical supervision of the patient which might in itself be a factor improving his prognosis. Nevertheless, the following results appear convincing as to the efficacy of such therapy.

Seventy-eight patients received anticoagulants over a period of two to sixty months totaling 823 months, with an average of ten months per person. There were 23 cases of coronary thrombosis, most of which were recurrent or complicated. The period of treatment varied from two to thirty-nine months and averaged thirteen months. In this group there were 2 failures. One patient, as mentioned in a previous communication,[3] sustained a fatal recurrence during the time of a 25 per cent prothrombin depression. Another, a 65 year old white man, was placed on Dicumarol after his third heart attack and had been asymptomatic for a period of twenty-two months when cortisone was administered because of a severe shoulder-hand syndrome. A fatal coronary thrombosis followed within a few

days even though his prothrombin level was within a therapeutic range. This death, perhaps, can be attributed to the steroid hormones, which may produce a hypocoagulability even in the presence of a prothrombin deficiency.[2]

Eighteen patients with recurrent cerebral thrombosis and 3 with multiple cerebral emboli received treatment from two to sixty months and averaged twelve months. None experienced any further episodes during treatment; 4 had recurrences after cessation of therapy.

In 18 patients with chronic, recurrent, or migratory peripheral thrombophlebitis the results were uniformly good. Duration of treatment varied from two to fourteen months but was usually limited to four months.

Eight cases of congestive heart failure with pulmonary and systemic emboli were treated with anticoagulants for two to forty months and averaged twenty-two months. No vascular episodes recurred during the time of treatment.

There were 8 patients with severe coronary insufficiency who received the drugs from two to forty months and averaged twelve. All experienced partial or complete relief of angina, many exhibited electrocardiographic improvements, and none sustained a coronary thrombosis during the time of treatment.

SUMMARY

The experiences of prolonged anticoagulant therapy in a group of 78 patients have been described. The simplicity and safety of such treatment in ambulatory cases has been demonstrated. The efficiency of such drugs in the treatment and prevention of various thromboembolic diseases has been evaluated.

THE SURGICAL TREATMENT OF CARDIOSPASM
Preliminary Report

CONRAD R. LAM, M.D., Detroit, Michigan

THE term "cardiospasm" has been used frequently to indicate a benign obstructive lesion at or near the junction of the esophagus with the stomach, usually associated with marked enlargement of the esophagus. Probably because the cause is obscure, there has been disagreement concerning the name which best describes the condition. In 1940 Ochsner and DeBakey[12] published an extensive review of the literature and concluded that the term "achalasia" is preferable. The word "mega-esophagus" was used by Wangensteen in the title of his recent paper,[14] but in subsequent discussion he suggested that "dystonia" is better. Fortunately, in spite of disagreement regarding the etiology and a name for the lesion, there is at this time a satisfactory crystallization of opinion about definitive surgical treatment. A satisfactory operation for cardiospasm has become available and recognized none too soon, because many of the surgical procedures carried out during the past five years have been followed by serious complications.

From the Division of General Surgery of the Henry Ford Hospital. Read before the Section on Surgery, Texas Medical Association, Annual Session, Houston, April 29, 1953.

UNSATISFACTORY TECHNIQUES

With the advent of good anesthesia for thoracic operations and the availability of antibiotic drugs, it became common practice to open the lumen of the esophagus in the lower part of the chest and to carry out various surgical procedures on the esophagus and the stomach. The most common indication was malignancy of the cardiac end of the stomach or the esophagus. The results of this type of surgical intervention were encouraging, and it is not surprising that thoracic surgeons had no fear of dealing with the ap-

parently simpler condition of a benign stricture involving perhaps less than a centimeter of the lower esophagus. Obviously, the constricted lumen could be enlarged by making a longitudinal incision and closing it transversely. Such an operation was first carried out by Wendel[15] in 1910. I performed this operation on 3 patients in 1946 and was immensely pleased with the immediate results. Dysphagia was relieved, and within a few weeks the size of the esophagus in each case was reduced to almost normal proportions (fig. 1). During the next four years, I operated on 6 other patients in a similar manner. In 1948 Kay[8] reported that he had done this operation in 17 cases and was pleased with the results.

In 1912 Heyrovsky[7] proposed an anastomosis between the fundus of the stomach and the dilated esophagus to by-pass the stricture, and his operation was subsequently modified by Gröndahl,[5] who described a cardioplasty which was analogous to the plastic operation at the pylorus performed by Finney. The latter method was used in a number of cases by Ochsner and DeBakey,[13] Bell,[1] and Grimson and his co-workers.[4]

As the years passed, it became evident that something was wrong with these operations which made a generous opening between the esophagus and stomach with destruction of the sphincter mechanism. Five of my 9 patients who had had the Wendel cardioplasty returned with evidence that the reflux of gastric juice into the esophagus had done considerable damage. All had definite signs of esophagitis and several had severe bleeding from ulceration. The following case report is instructive.

B. B., a 70 year old white woman, was observed in February, 1951. For eleven years she had had dysphagia which had been only slightly and temporarily relieved by dilatation. The esophagus was huge. A Wendel cardioplasty was carried out, and convalescence in the immediate postoperative period was uneventful. The patient was discharged two weeks after the operation but was readmitted the next day with evidence of massive gastrointestinal bleeding. During the next two years she received approximately fifty transfusions. Resection of the lower esophagus and acid-bearing portion of the stomach was advised, and this procedure was done by a surgeon in another city.

The description by the pathologist (Dr. Alfred E. Rhodes) of the specimen was as follows:

"The specimen consisted of a tubelike segment of the lower esophagus with the adjacent portion of the stomach. The esophageal portion was edematous. The lining showed an irregular superficial ulceration 2 cm. in its largest diameter at the level of the cardia. The base and edges of the ulcer showed grayish-white tissue. The lining of the esophagus showed numerous patches of white, thickened tissue.

"*Microscopic Examination:* Sections showed a portion of the esophageal and stomach wall partially covered by stratified epithelium and stomach mucosa. Proximal to the stratified squamous epithelium for some distance the whole esophageal lining was necrotic as was also the underlying tissue, which contained many fragmented leukocytes and deeper, round cell and granulocytic infiltration. Much of the connective tissue and muscular wall of the gastric portion of this section showed hyalinization.

Diagnosis: Necrotic and chronic fibrosing esophagitis with degenerative changes in the wall of the cardiac portion of the stomach."

It became obvious that one could not apply the experience with partial gastric resection and esophagogastrostomy to the management of cardiospasm. Such operations for cancer were accompanied not only by an automatic bilateral vagotomy but also by a resection of all or most of the acid-secreting portion of the stomach. Reflux esophagitis was absent or minimal, and in any event, the patient could be told that he was better off with the substernal discomfort than to be dead of cancer. The addition of vagotomy to the operation of cardioplasty for cardiospasm appeared to offer some promise of ameliorating the peptic esophagitis, but Kay[9] informed me that he had tried it and observed it to be unsatisfactory. Wangensteen[14] tried a radical procedure, consisting of resection of the lower end of the esophagus and most of the stomach with end-to-end anastomosis and a pyloroplasty to favor emptying after the concomitant vagotomy. His patients were satisfied, but at the time of presentation of his paper, Wangensteen was inclining toward the more conservative procedure about to be described.

HELLER PROCEDURE

As early as 1913 the German surgeon Heller[11] had described his operation of extramucosal cardioplasty. This was a Ramstedt procedure at the cardiac rather than the pyloric end of the stomach. Heller made two longitudinal incisions in the muscular layers of the stomach and esophagus, on the anterior and posterior aspects of the cardia (fig. 2). Heller told how from the first day the patient could eat bread, meat, and potatoes; previously, he had been able to ingest fluids only, had a foul breath, and was losing weight.

It is difficult to understand why this brilliant result did not cause the operation to become generally popular. As a matter of fact, it was used considerably, since Ochsner and DeBakey[12] in 1940 were able to collect 104 instances of Heller operations. Recurrence of symptoms took place in 14 cases, and there were 4 deaths. Two of these deaths were due to infection which followed tearing of the mucosa, 1 to perforation following subsequent dilatation, and 1 to pulmonary embolism. Considering that all or most of these operations were done through the poor exposure obtained by the abdominal approach and all were done in the preantibiotic era, the record is far from black. A little later the British surgeon Maingot[11] reported using Heller's operation in 39 cases with 37 excellent results.

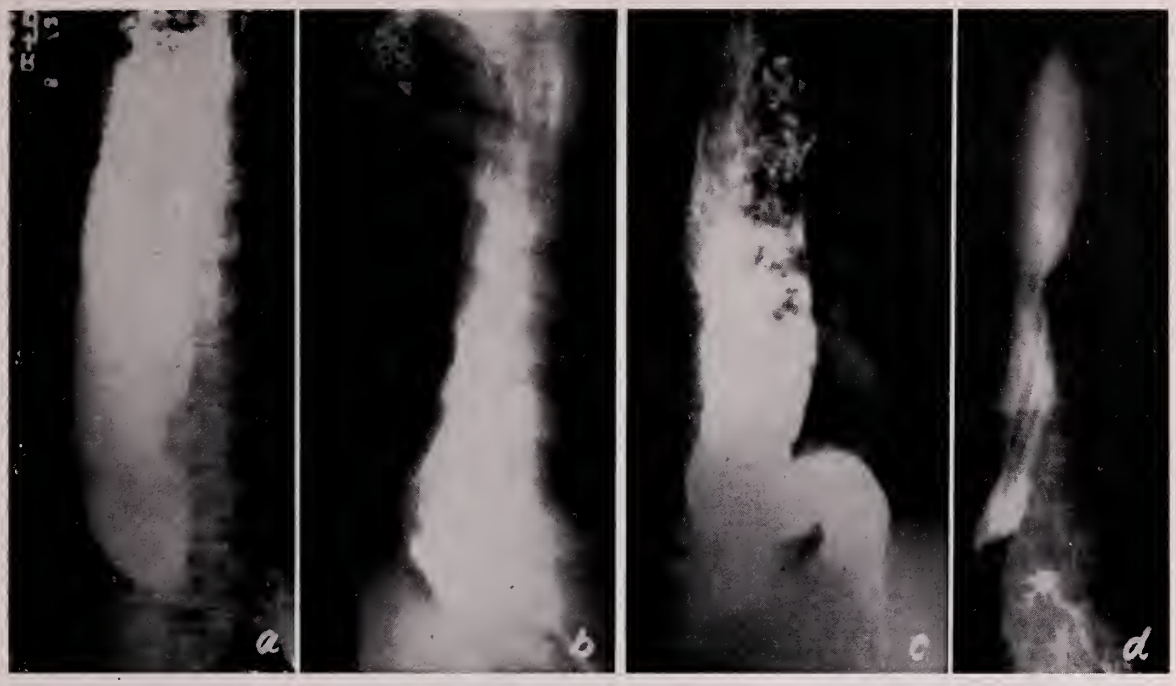

FIG. 1a and b. Roentgenograms of the esophagus showing marked dilatation due to cardiospasm before operation (*a*) and reduction in size only twelve days after a cardioplasty of the Wendel type.

c and d. Roentgenograms of the esophagus made before operation and nineteen days postoperatively showing relief from cardiospasm obtained by the Wendel operation.

Nevertheless, in 1951 at the meeting of the American Association for Thoracic Surgery, DeBakey[2] discussed Kay's paper[10] on achalasia of the esophagus as follows: "The fact that this operation was proposed by Gottstein approximately fifty years ago, first performed by Heller almost forty years ago, subsequently modified by a number of other surgeons, and abandoned and revived from time to time, strikes me as significant. Such considerations in the historical development of an operative procedure usually reflect dissatisfaction with its ultimate results as well as with its rationale. For these reasons, it would seem desirable in the current revival of this operative procedure to provide additional facts for its rationale. The question which needs to be answered is why is it a better operation now?"

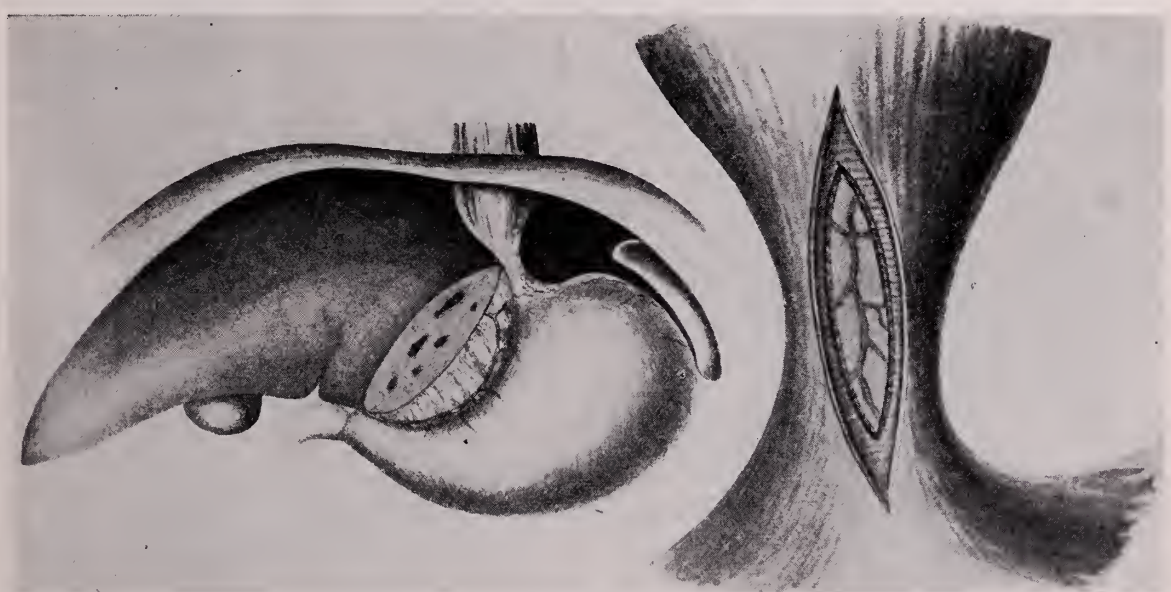

FIG. 2. Copies of the illustrations from Heller's article on cardiomyotomy[6] showing theoretical exposure by the transabdominal approach and the two extramucosal incisions into the esophageal and gastric walls.

After discussing my experience with the Heller operation, I shall try to answer Dr. DeBakey's question.

I have performed Heller's operation on 9 patients. The technique has been as follows. Through a posterolateral incision, the left thoracic cavity is entered through the eighth interspace (fig. 3). The eighth rib is transected posterior to its angle. The pleura

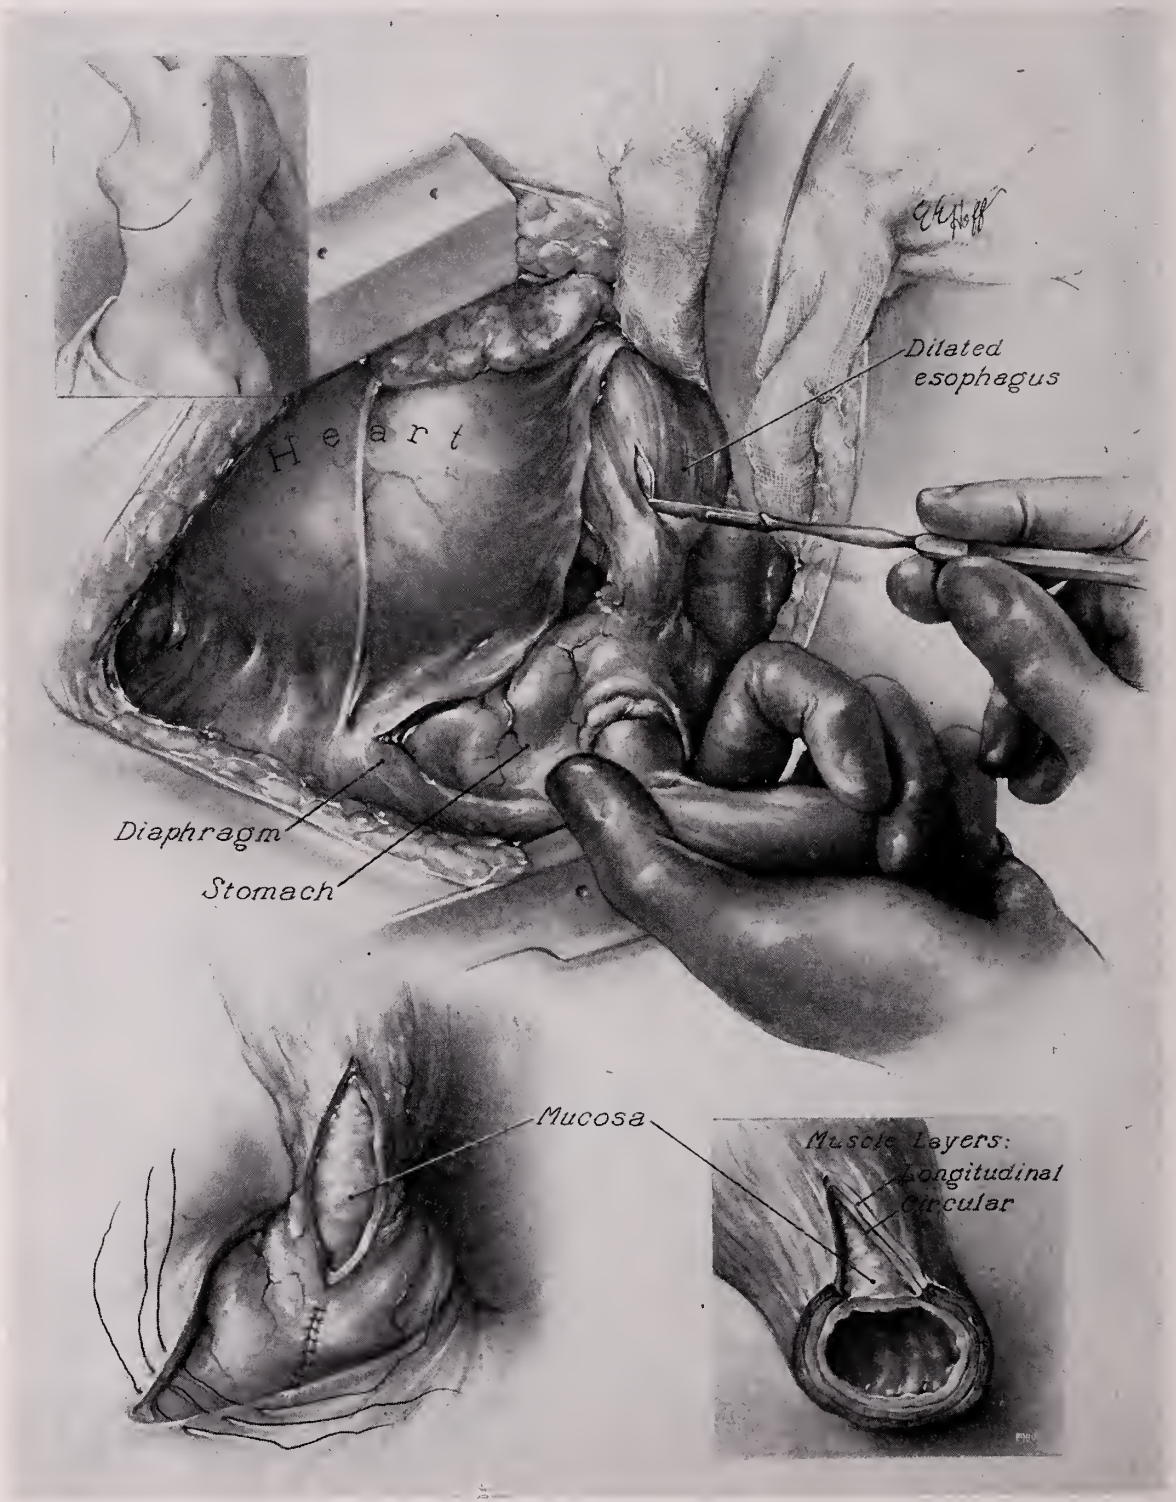

FIG. 3. Diagrams illustrating the technique of cardiomyoplasty, modified Heller method.

overlying the lower part of the dilated esophagus is divided and reflected. A short incision is made in the hiatus of the diaphragm to permit visualization of a portion of the stomach. The proposed line of the longitudinal incision, measuring between 4 and 5 inches in length, is cleared of areolar tissue and vascular channels. Beyond the proposed incision in the muscular coats of the stomach, a small incision is made into the lumen of the stomach through which the left forefinger is inserted. This finger explores the area of stricture and is passed through it if possible. With the finger as a guide to prevent injury to the mucosa, the serous and muscular coats of the stomach and the muscular wall of the esophagus are incised. The finger immediately appreciates the relaxation which has been produced. The opening into the stomach is then closed, the incision in the hiatus is repaired, and the chest is closed without drainage after the instillation of penicillin. The patient is fed intravenously for a few days, during which time the bare mucosa should have become agglutinated to the adjacent structures. Nausea and vomiting during the immedate postoperative period might result in rupture of the esophagus at the operative site.

There has been no mortality or important morbidity attributable to the operation. In 1 patient the operation was done for palliation in the presence of complicating carcinoma of the middle portion of the esophagus.[3] The subsequent autopsy in this patient, who died of perforation of the carcinoma into both main bronchi, gave an excellent opportunity for examination of the adequacy of the Heller procedure. The obstruction had been completely relieved.

The other 8 patients have had gratifying clinical results (fig. 4) and several have been followed for more than a year.

In answer to Dr. DeBakey's question, "Why is the Heller operation better now?" one might first say that it was never as bad as implied, since, it will be recalled, there were only 14 recurrences of symptoms and 4 deaths in 104 collected cases. It is likely that the thoracic approach leads to a more thorough operation, since the incision through the esophageal musculature can be made adequately high. Furthermore, all of the factors which make modern thoracic surgery safer are operating to make the patient receiving the Heller operation today surer of leaving the hospital without misfortune.

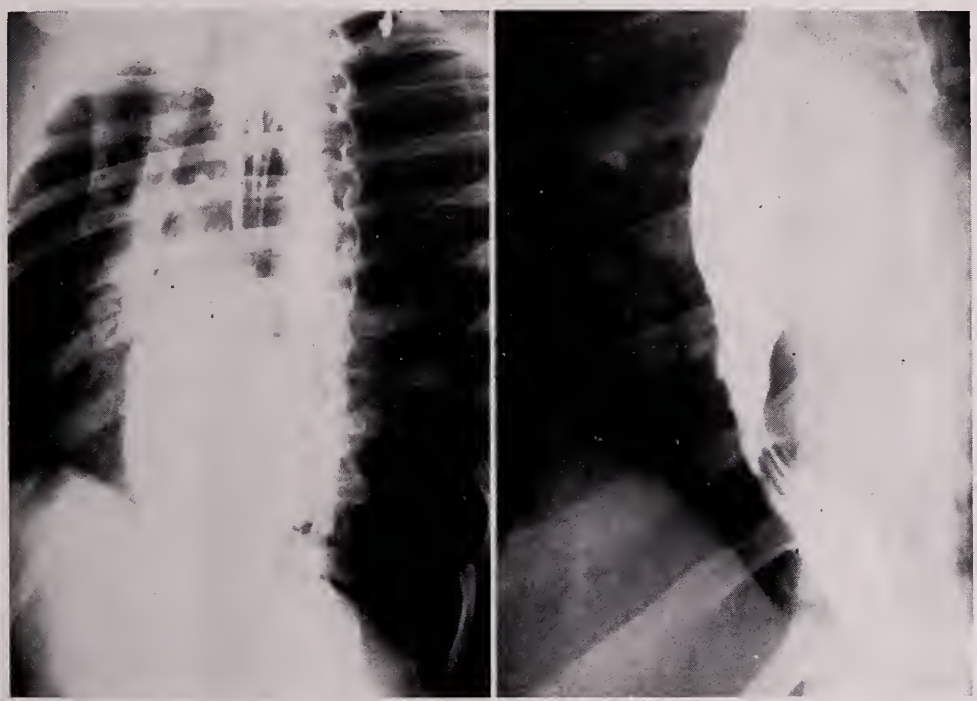

FIG. 4. Roentgenograms made before operation and three months postoperatively showing cardiospasm treated by the Heller operation.

HYDROSTATIC DILATATION

Finally, a word should be said regarding hydrostatic dilatation. It is probable that gastroenterologists and endoscopists will continue to give relief to a certain number of patients with cardiospasm for some time to come. However, as they note recurrences of strictures and find their patients drifting off to other clinics, it is likely that they will recommend definitive surgical

correction (the Heller operation) with increasing frequency.

SUMMARY

Personal experience with 18 cases of cardiospasm (mega-esophagus, achalasia, esophageal dystonia) has been presented. Cardioplasties of the Wendel type were done in 9 cases with unsatisfactory end results because of the incidence of esophagitis and peptic ulceration. Extramucosal cardiomyotomy of the type proposed by Gottstein and first performed by Heller has been carried out in 9 cases with gratifying results.

ABSTRACT OF DISCUSSION

DR. H. T. BARKLEY, Houston: I am happy that the problem of cardiospasm is being brought to our attention. In this connection I cannot resist the temptation to say something about the role of emotional disturbance in etiology and stress the importance of the psychosomatic approach. The patient probably will develop other gastrointestinal symptoms unless the psychosomatic factor is considered.

In my opinion hydrostatic dilatation does not cure cardiospasm; I have seen the condition worsened by dilatation. At the same time, cardioplasty is not without hazards. I have been impressed with the thickening of the muscularis at the cardia causing a constricting ring. Extreme mega-esophagus must be resected. It appears that the Heller procedure offers the safest relief of cardiospasm and its symptoms.

Recently I have seen a patient with cardiospasm and carcinoma, indicating the need for endoscopic examination of all patients with cardiospasm before any type of therapy is considered.

DR. DENTON A. COOLEY, Houston: Dr. Lam apparently has discarded esophageal bougienage in treating achalasia of the esophagus. I agree that repeated gentle dilatations with the Hurst mercury-weighted bougie was a nuisance to the patient and for the most part unsatisfactory. On the other hand, the results with the hydrostatic dilator (Plummer, Negus) have been much more encouraging, and recent reports from the Mayo Clinic and from clinics in England substantiate this point. I believe the technique of hydrostatic bougienage continues to have a place in treatment of the debilitated patient. In patients with an enormously dilated esophagus, however, one should perhaps use the cardiomyotomy of Heller or in some cases esophageal resection. The long-term results with Heller's operation are definitely better than those with cardioplasty because of the absence of acid-pepsin reflux, but I also have seen reflux esophagitis in patients after cardiomyotomy. In my opinion selection of treatment in achalasia of the esophagus should depend upon the clinical findings in the individual patient, and all patients should not necessarily be treated alike.

Chest Surveys

A Joint Committee on Diseases of the Chest, established by the American College of Chest Physicians and the American College of Radiology, has adopted a report suggesting guiding principles on the problems involved in routine chest roentgenograms in hospitals and mass chest surveys. This pooling of ideas is expected to be a continuing process, and an exchange of opinion is invited by Dr. Leo G. Rigler, Minneapolis, and Dr. Otto L. Bettag, Chicago, co-chairmen.

The current report, which has the approval of the board of regents and the board of chancellors respectively of the two organizations, recommends that each physician be encouraged to have chest roentgenograms of all of his patients; that every patient admitted to a hospital have a routine chest examination; and that follow-up for each suspected lesion seen in chest surveys should assure the patient's coming under medical supervision.

The report points out that routine chest roentgenograms are useful in screening normal from abnormal chests, but that *even 14 by 17 inch films are diagnostic aids only and should not take the place of complete clinical examinations.* Insofar as financial resources and qualified personnel permit double reading of chest roentgenograms, this procedure will increase the percentage of positive diagnoses, but a check mechanism should be instituted to eliminate the false positives. It is noted that the number of lesions overlooked in screening examinations because of clothing is so small as to make it feasible to conduct such examinations with the patient fully clothed.

The importance of continuous monitoring of all personnel associated with photofluorographic equipment to determine radiation exposure and prompt measures to correct faulty techniques or imperfect equipment permitting excessive exposure is stressed.

The committee agreed that interpretation and reporting of roentgenographic findings is a medical matter and should be handled by a responsible physician compensated like any other physician practicing his profession.

Contributions to the Memorial Library of the Texas Medical Association pay appropriate tribute upon the death of a person close to the medical profession. A card of acknowledgment and a memorial book plate help to perpetuate the memory of the deceased. Further information may be obtained from the Library, 1801 Lamar Boulevard, Austin.

SURGICAL TREATMENT OF MITRAL AND AORTIC STENOSIS

Results of 115 Valvotomies

DENTON A. COOLEY, M.D.; MICHAEL E. DeBAKEY, M.D.; RAY H. SKAGGS, M.D.; and DON W. CHAPMAN, M.D., Houston, Texas

DURING the past five years remarkable advance has been made in developing surgical procedures for the relief of congenital and acquired stenosis of the mitral and aortic valves.

TECHNIQUES

Mitral Stenosis

At the beginning of this century Brunton[4] and Samways[16] proposed that mitral stenosis, being a mechanical obstruction to blood flow, should be amenable to surgical correction, and in 1923 Cutler and Levine[12] reported the first clinical attempts at mitral valvotomy. During the ensuing years these and a few others (Allen and Graham, Pribram, and Souttar[11]) operated upon 10 patients with mitral stenosis, 2 of whom survived the operation and only 1 of whom was improved. The latter patient was operated upon by Souttar[18] to whom credit belongs for performing the first successful commissurotomy. This single case did not justify the prohibitive operative mortality of 80 per cent in the entire group, and further clinical trials were not soon forthcoming.

Recently with the inspiring leadership of Smithy,[17] Bailey,[1] Harken,[14] and Brock,[3] the surgical relief of mitral stenosis has become feasible and is now accompanied by a relatively low operative risk. The improved results have been obtained by controlling the degree of mitral regurgitation occurring after the stenosis is overcome by valvotomy. In most of the earlier attempts valvotomy was done by introducing a valvulotome into the heart in order to punch out more or less at random a piece of the stenotic valve. In the few instances where this aim was accomplished, a severe and usually fatal degree of mitral insufficiency was the consequence. With better understanding of the mechanism of valve action, a technique of valvotomy by incision at the point of fusion (commissures) of the leaflets has been developed. Thus by preserving the integrity of the leaflets and restoring valvar action, the crippling effects of mitral stenosis are overcome without the production of mitral insufficiency.

From the Departments of Surgery and Medicine, Baylor University College of Medicine, and the Jefferson Davis, Methodist, and Veterans Administration Hospitals.

This study was aided by a grant from the Houston District Chapter, Texas Heart Association.

Patients in our series were selected for mitral valvotomy if there was evidence of mitral stenosis in relatively pure form, although moderate degrees of mitral insufficiency did not preclude operation. Details of clinical evaluation of patients before operation are reported elsewhere.[6, 10] Cardiac catheterization was performed in the first 30 consecutive patients in this series,[5] but in the last 80 of the 110 patients treated by mitral valvotomy it has been done only in doubtful cases. These studies showed elevation of pulmonary arterial and pulmonary capillary pressures at rest and particularly with exercise. In most cases cardiac output during rest and exercise was below normal and in general reflected the degree of functional incapacity. As determined by the formula of Gorlin and Gorlin,[13] the cross-sectional area of the normal mitral valve is 4 to 6 sq. cm., but in our patients the calculated valve area was less than 1.5 sq. cm. Moreover, there was a relatively close correlation between the calculated valve size and the size estimated by palpation at operation.

Radiographic studies of patients for commissurotomy have been of definite value. So-called mitralization of the cardiac contour includes right ventricular and left atrial enlargement and dilatation of pulmonary arteries (fig. 1). In the absence of significant associated valvar lesions, there is no enlargement of the left ventricle. Characteristically the left atrium in mitral stenosis presents as a chamber of moderate diameter which indents the esophagus over a relatively short distance in contrast to the tremendous saclike dilatation of the left atrium which may accompany mitral insufficiency. On the other hand 2 of our patients with pronounced stenosis and mild insufficiency of the mitral valve had extreme left atrial enlargement, and both patients obtained satisfactory functional results following valvotomy. In our opinion the most reliable single diagnostic feature in selection of patients for operation is the presence of the typical rumbling diastolic murmur of mitral stenosis.

Patients were prepared for operation by digitalization, salt restricted diets, and mercurial diuretics. One hour before operation, quinidine sulfate (3 to 6 grains) was administered orally. For the most part cardiac arrhythmias other than extrasystoles were not serious

during operation, and only occasionally was quinidine lactate given parenterally or intravenously during anesthesia. Intravenous or topical administration of procaine hydrochloride and procaine amide was not employed in this series of cases.

The operative technique used in these patients has been described in detail elsewhere[9]; therefore only a brief description will be given here. The patient lies supine on the operating table with the left shoulder slightly elevated and the left arm suspended from an overhead frame. A curved anterior submammary incision is made on the left, and the chest is entered through the fourth intercostal space after the fourth costal cartilage is divided. After insertion of a self retaining retractor, the left lung is partially collapsed, and the pericardium is entered anterior and parallel to the phrenic nerve and vessels. The incision in the pericardium provides adequate exposure of the pulmonary artery and left auricular appendage. Direct pressure determinations are made in the pulmonary artery, left atrium, and aorta. A purse-string suture of 0 black silk is placed about the base of the atrium and is used to control hemorrhage if necessary. A non-crushing clamp is placed across the base of the appendage, and near its apex an incision is made sufficiently large to accommodate snugly one's index finger. In patients suspected of having atrial thrombosis, the auricular clamp is released briefly to allow a gush of blood to wash out any loosely attached thrombi. Then as the auricular clamp is removed slowly, the index finger is inserted into the cardiac chamber.

Exploration of the atrium reveals whether or not mural thrombi are present, the elasticity and suppleness of the leaflets, the presence of calcification of the valve, and the degree of mitral regurgitation. Digital pressure and finger dissection at the commissures usually will produce the desired split, but occasionally a special valvotome may be employed to commence the valvar incision. The finger is introduced into the mitral orifice for a period not exceeding four or five heart beats in order not to impede blood flow for a significant period. After commissurotomy is accomplished, the finger is withdrawn into the atrium where a regurgitant jet of blood may be palpable during systole. Usually a carefully performed valvotomy produces no mitral insufficiency. As the finger is withdrawn from the heart, the auricular clamp is reapplied simultaneously with little or no blood loss. The auricular appendage is then amputated close to its base after the purse-string suture has been removed. The auricular opening is sutured with a double row of interrupted silk sutures, and pressures are again measured in the pulmonary artery, left atrium, and aorta for comparison with the prevalvotomy determinations. The pericardium is sutured loosely to allow drainage of pericardial fluid into the pleural cavity. An intercostal catheter is inserted into the pleural cavity for underwater drainage, and the incision is closed in layers. Ordinarily the amount of blood lost does not necessitate a blood transfusion.

After operation digitalization and salt restriction are maintained. Hemorrhagic shock rarely occurs. In all

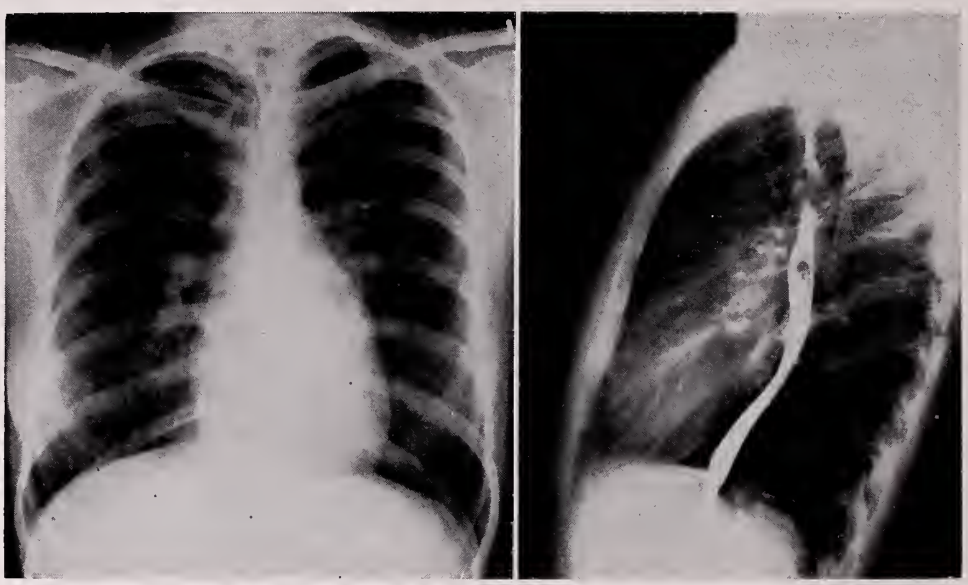

FIG. 1. Roentgenograms of the chest of a 26 year old housewife (functional class 3) demonstrating the typical mitralized contour of the cardiac silhouette. In the posterior-anterior view (*left*) the enlarged pulmonary arterial segment and left auricular appendage produce the prominence of the left cardiac border. In the lateral projection (*right*) indentation of the esophagus posteriorly by the distended left auricle is well demonstrated. The right ventricle is moderately hypertrophied, and the left ventricle is of relatively normal size. Mitral valvotomy in this case produced an excellent result.

patients with a sinus rhythm before operation quinidine sulfate (3 grains every four hours) is administered postoperatively to prevent the development of auricular fibrillation and is maintained for a period of four to six weeks. In 18 patients with sinus rhythm before operation fibrillation has occurred postoperatively, and in all but 1 sinus rhythm was restored by the oral administration of quinidine in larger doses. In our opinion it is desirable to maintain a sinus rhythm whenever possible. In some patients with auricular fibrillation before operation an attempt is made to convert the rhythm to sinus after operation, but conversion of the rhythm is not necessary to produce adequate functional improvement. Anticoagulants may be used in conjunction with quinidine in such cases. The usual period of postoperative hospitalization is eight days.

Aortic Stenosis

Aortic stenosis presents a more complex problem to the cardiologist and surgeon because of physiologic and pathologic features peculiar to lesions of the aortic valve. Patients may remain surprisingly well with a loud aortic murmur and marked left ventricular hypertrophy until decompensation occurs, but once this takes place there ensues an almost intractable condition which is extremely difficult to combat. The impaired function of the aortic valve interferes with coronary circulation and largely accounts for the inability of the failing left ventricle to recover its function. Thus patients should be operated upon for this condition before they have reached this precarious phase of the disease.

Aortic stenosis may be either of congenital or acquired origin. In congenital aortic stenosis the obstruction either may be in the valve itself or may occur in the subaortic zone as a fibromuscular membrane. If the stenosis is extreme, the patient may be subject to fainting attacks and even sudden death, but in most instances the congenital lesion is well tolerated. Acquired lesions of the aortic valve producing stenosis are usually the result of rheumatic fever, but there may be superimposed atherosclerosis and calcific changes particularly in the fifth and sixth decades of life. Under these circumstances the valve ring becomes rigid and immobile. Valvotomy after such changes have occurred may produce only slight benefit to the patient.

In 1913 Tuffier[26] made the first successful attempt at operative correction of aortic stenosis by digitally invaginating the aortic wall and dilating the valve. Interest in the surgical approach to this problem was revived by the late Horace Smithy,[24, 25] who himself died in 1948 of aortic stenosis. Numerous techniques for aortic valvotomy have been proposed.[19-23] The most satisfactory method in our opinion is described by Bailey, Redondo Ramirez, and Larzelere,[19] in which procedure a special valvotome is passed through the wall of the left ventricle into the stenotic valve. The head of the valvotome is composed of three expanding parts which engage the fused commissures and when opened split the cusps apart. Although a moderate degree of aortic insufficiency may be produced if the valve leaflets are ruptured or torn, relief of aortic stenosis may be obtained with associated clinical improvement if the valve is sufficiently supple to allow it to open and close after valvotomy is accomplished.

CLINICAL RESULTS

This report deals with 110 patients undergoing mitral valvotomy and 5 patients undergoing aortic valvotomy between March, 1951, and November, 1953. Although aortic and mitral stenosis occurred in combination in several instances, simultaneous aortic and mitral valvotomy was attempted only once.

Mitral Stenosis

In the series of 110 patients operated upon for mitral stenosis, there have been 10 deaths occurring at varying intervals following operation. In the 100 survivors an attempt has been made to estimate the degree of improvement, based on relief of symptoms, functional improvement, and when possible, information obtained by cardiac catheterization. Results were considered good in 74 of the survivors, fair in 19 patients, and poor in 7. In the group of patients whose results were classified good, there were many with excellent and striking restoration of functional activity, and in these, cardiac murmurs were almost eliminated. In others, the functional improvement was exceptionally good, but there was less striking alteration of the cardiac murmurs.

Deaths.—The 10 patients who died in this series of 110 mitral valvotomies were severely incapacitated, class 4 patients, most of whom were in the advanced age group (table 1). Moreover, all of these patients had had fibrillation before operation and 2 had previously had peripheral embolism. Of prime importance in the fatal cases was the fact that thrombosis and embolism was the probable cause of death in 9 patients. Thrombosis of a calcified mitral leaflet was evident in 2 patients and produced progressive valvar occlusion. Peripheral embolism definitely contributed to the death of 3 patients, and cerebral embolism was presumed to have been present in 2 others. Massive pulmonary embolism caused death in 2 patients, thirty hours and six days respectively after operation, and was the presumptive cause of death in a third patient who died suddenly at home one month after

operation. One patient who before operation had severe mitral insufficiency and almost intractable decompensation died of pulmonary edema four days after exploration of the mitral valve.

Severity of Cardiac Condition.—Functional rating of patients is similar to the classification proposed by the New York Heart Association.

As shown in table 2, 40 per cent of the patients in this series were in class 4, and 93 per cent were in either class 3 or 4. Most of the patients were severely disabled, and many had been totally bedfast from three to eighteen months. The percentage of good to fair results was higher in class 3 than it was in class 4, although good results were obtained in about 60 per cent of the patients in class 4. This high percentage of good results in class 4 patients would appear to offset the fact that all deaths occurred in this group. Operation thus seems to be justified in these patients who are otherwise destined to chronic invalidism or premature death.

Age.—The ages of the patients varied over a wide range between 16 years and 58 years, with 69 patients being less than 40 years of age and 41 patients more than 40 years old.

In all patients less than 25 years of age the possibility of reactivation of the rheumatic process by operation deserves consideration. All of our younger patients therefore were observed carefully for varying periods before operation to detect symptoms of rheumatic activity. Four patients in the younger group following operation have had transient symptoms suggestive of a recrudescence of rheumatic fever. In general, however, the most satisfactory results were obtained in patients between 25 and 35 years. In patients more than 40 years of age good results were obtained in 22 (more than half), and there were 7 deaths. In patients less than 40 years of age good results were obtained in 57 (about four-fifths) and 3 patients died. Although the fatality rate in the older patients was higher than in the younger group, the percentage of good results in the patients above 40 years justifies operation. The oldest patient in this series was 58 years old, and an excellent result was obtained. Three other patients beyond 50 years of age have obtained good symptomatic relief from operation.

Previous Embolism.—Peripheral embolism occurred before operation in 16 patients, and in 7 of these there were multiple emboli. Ten patients had cerebral emboli producing neurologic sequelae such as hemiparesis and partial aphasia. In others the emboli lodged in the vessels of the extremities or viscera (spleen, kidney, intestine). Seven patients were suspected of having pulmonary infarctions before operation, but in 4 of these the evidence was equivocal. Twelve of the patients with previous peripheral emboli had fibrillation at the time of operation. In this series of 16 patients with peripheral emboli prior to operation, 3 showed evidence of embolization after operation, 2 of which were fatal. Thus among the 14 patients who survived operation only 1 subsequently developed this complication. It appears, therefore, that peripheral embolism in the presence of mitral stenosis is actually an indication for valvotomy and offers best protection against future embolization.

Auricular Fibrillation.—Before operation 54 patients had auricular fibrillation, and 56 patients had sinus rhythm. Good results were obtained in 32 patients with auricular fibrillation and in 42 patients with sinus rhythm. Fibrillation was present in all patients who died. These results indicate that although auricular fibrillation is not a contraindication to valvotomy, it apparently does increase the operative risk and slightly diminishes the possibility of obtaining a

TABLE 1.—*Analysis of 10 Deaths in Series of 110 Mitral Valvotomies.*

Case	Age (Yr.)	Sex	Functional Classification	Auricular Fibrillation	Operative Findings	Survival	Cause of Death
1	53	M	4	+	Mural thrombi; calcified valve	30 hr.	Aortic "saddle" embolus
2	51	M	4	+	Calcified valve	4 mo.	Thrombosis mitral valve, aortic "saddle" embolus
3	49	F	4	+	Mural thrombi; calcified valve	3 days	Cerebral embolus
4	31	F	4	+	Marked mitral insufficiency	4 days	Congestive failure
5	47	F	4	+ (Flutter)	Calcified valve	1 mo.	Possible pulmonary embolus
6	33	M	4	+	Mural thrombi; temporary carotid occlusion	16 hr.	Cerebral anoxia; cerebral embolus(?)
7	47	F	4	+	Mural thrombi; calcified valve	10 days	Cerebral infarct; pulmonary congestion
8	37	M	4	+	Mural thrombi; calcified valve	6 days	Massive pulmonary embolus

good functional result. On the other hand, the proportion of good results in the patients with fibrillation is sufficiently high to justify operation.

Of real importance in auricular fibrillation is the frequency of the presence of mural thrombosis in the auricle. In the 54 patients with fibrillation, mural thrombi were demonstrated in the left atrium or auricular appendage in 17 instances. In 4 of these embolism was discovered soon after operation. In 1 the embolus involved only pulmonary vessels, indicating that there may have been right atrial thrombosis as well as left. Measures taken at operation to reduce the danger of embolism have been employed in all patients with auricular fibrillation and mural thrombosis. In most cases the valve was approached through the left auricular appendage whether or not it was suspected of containing thrombi. Access to the valve was gained through the superior pulmonary vein in 2 cases where the appendage was contracted and fibrosed or calcified, preventing its use as a means of safe entry into the heart.

In 6 patients the left atrium was completely lined by thrombi in varying stages of organization, but valvotomy was performed in all. Death from cerebral embolism occurred in 1 of these patients, and the others recovered uneventfully. Although it seems desirable during intracardiac manipulation to have the anesthetist compress the carotid arteries to prevent cerebral embolization, this technique failed to prevent fatal embolism in 1 case. The technique suggested by Bailey[2] for temporary complete occlusion of the carotid circulation within the thorax has been employed in 9 patients but also may be unreliable and even dangerous. If intrathoracic occlusion of the carotid arteries is to be used under these circumstances, the period of occlusion should be less than two minutes and full oxygenation of the circulating blood must be assured before the vessels are clamped. Obviously, temporary carotid occlusion does not preclude the possibility of emboli lodging elsewhere in the arterial system. Anticoagulants have been employed after operation in some of the patients but not in a sufficient number to permit definite conclusions.

Valvar Calcification.—The more extensively calcified mitral valve may be demonstrated by fluoroscopy and roentgenography prior to operation, but from our experience this finding does not contraindicate exploration. Calcification of the mitral valve was discovered at operation in 53 patients (48 per cent) in this series. In some instances calcification was extensive and involved the valve leaflets as well as the commissures. In a few, exuberant calcification was palpated at the commissures, usually the anterolateral one, but surprisingly good results have been obtained in these patients. When a split is made through a calcified commissure, mild but not incapacitating mitral insufficiency may be produced. In no instance did embolization of a calcified fragment occur or did bacterial endocarditis supervene. Of the 53 patients in whom calcification of the valve was discovered at operation, good results were obtained in 31 patients, fair results in 10 patients, poor results in 4, and 8 patients died.

Associated Valvar Lesions.—Although a moderate to marked degree of mitral insufficiency was present in about 25 patients operated upon, concomitant lesions of other valves were infrequent. Three patients had a moderate degree of associated aortic stenosis, but in none was simultaneous mitral and aortic valvotomy done. One of these patients died ten days after operation of thrombosis of the valve and sudden occlusion of the mitral orifice. The other 2 patients obtained excellent functional results in spite of the persistent aortic stenosis, although subsequent aortic valvotomy may be required in 1 of these patients. Aortic insufficiency was not demonstrated in any patient. Increasing experience indicates that a Graham-Steele murmur of functional pulmonic insufficiency is a frequent finding in pure mitral stenosis (26 cases in our series) and mimics the murmur of aortic insufficiency. When pulmonary arterial pressure is reduced after commissurotomy, the Graham-Steele murmur disappears. Before operation none of the patients was suspected of having associated tricuspid or pulmonic valvar lesions.

In general, the finding of a grade 1 or 2 mitral systolic murmur with mild left ventricular enlargement does not preclude surgical treatment in patients in whom mitral stenosis is the predominant lesion. A carefully performed mitral valvotomy seldom increases the degree of mitral insufficiency. In 5 patients, however, it was thought that mitral regurgitation was increased by the valvotomy, but in these instances the relief of mitral stenosis produced gratifying functional improvement. Commissural dissection should be performed with extreme care so that valvar action is restored and the stenosis relieved without producing an incompetent valve. Mild mitral insufficiency frequently accompanies mitral stenosis, but even in these cases valvotomy may produce striking functional improvement.

Pregnancy and Mitral Stenosis.—Five patients in this series were pregnant at the time of valvotomy. The first was a 28 year old primigravida in the fourth month of pregnancy who was experiencing progressive disability and mild decompensation. Valvotomy produced an excellent functional result, and five months later she delivered uneventfully a 7 pound normal girl.[8] A second patient was a 24 year old primigravida in the third trimester of pregnancy. She

had experienced 2 attacks of severe pulmonary edema in spite of a rigid regimen to control cardiac symptoms. Operation was performed during the thirty-sixth week of pregnancy, and sixty-two hours later she delivered a 5 pound 10 ounce boy. Mother and son were discharged from the hospital five days after delivery in good condition. Three other patients have undergone valvotomy during pregnancy, and all subsequently have withstood delivery uneventfully.

This experience indicates that mitral valvotomy is not only feasible during pregnancy but should be attempted in those instances of class 3 and 4 cardiac patients if the anticipated risk of decompensation during delivery appears to be serious. If commissurotomy is to be done under such circumstances, the optimum time for operation is before the fifth month of pregnancy. Further experience is necessary before other specific recommendations can be made in regard to cardiac surgery during pregnancy.

During operation the pressures in the left auricle, pulmonary artery, and a systemic artery have been measured before and after valvotomy. An immediate fall in mean pulmonary artery pressure and also in the left atrial pressure of 15 or 20 mm. of mercury represents a good immediate response. In several patients whose mean pulmonary arterial pressure was exceedingly high (80 to 100 mm. of mercury), the pressure did not fall immediately after commissurotomy in spite of a significant drop in left atrial pressure. This indicates that in some patients with mitral stenosis the vascular changes in the pulmonary vessels may delay the restoration of normal pulmonary pressure after operation. These vascular changes have been described in detail previously by Parker and Weiss.[15] In most of our patients such histologic changes have been investigated by lung biopsy and will form the basis of a subsequent report.

Recurrence of mitral stenosis after valvotomy has not taken place in any of our patients and must be rare, probably because the rheumatic infection is quiescent in patients selected for operation.[7] Other factors, too, undoubtedly are responsible for this gratifying observation. Histologic studies of the amputated auricular appendages reveal endocardial thickening and subendocardial infiltration with round cells in most specimens, but Aschoff nodules were encountered in only a few specimens, and other histologic findings of acute rheumatic carditis have not been demonstrated.

Aortic Stenosis

In 5 patients aortic valvotomy has been performed by the transventricular route using the Donaldson-Bailey valvotome. Three patients have survived operation and are improved, and 2 have died (table 3). In the first patient, a 40 year old taxi driver, the aortic stenosis was considered to be postrheumatic and was markedly incapacitating. Direct radial pulse tracings made before and after valvotomy indicated considerable improvement in cardiac output as evidenced by the change in the contour of the systolic component. There also was a general increase in functional capacity following operation, and no aortic insufficiency was produced.

TABLE 3.—*Analysis of 5 Cases of Aortic Valvotomies.*

Case	Age (Yr.)	Sex	Etiology	Operation	Remarks
11	40	M	Rheumatic	2-6-53	Uneventful recovery; improved
12	6	M	Congenital	2-17-53	Uneventful recovery; improved
13	27	F	Rheumatic	3-10-53; combined aortic and mitral valvotomy	Died; cardiac arrest and fibrillation during chest incision
14	10	M	Congenital	3-19-53	Recovered and improved; moderate aortic insufficiency
15	46	F	Rheumatic; calcific	6-12-53	Died; ventricular fibrillation during insertion of valvulotome

The 2 deaths occurred during operation. The first of these was a 27 year old woman who had severe cardiac dysfunction (class 4) with combined aortic and mitral stenosis. For the previous two months she had been in moderate to severe intractable congestive failure and required almost continuous oxygen therapy. Operation was undertaken as a last resort. Cardiac arrest occurred during induction of anesthesia. Hasty aortic and mitral valvotomies were done, and both valves were found to be markedly stenosed. Subsequently feeble heart action was restored temporarily by cardiac massage, but effective cardiac action was not maintained, and the patient died. The other seriously ill patient, who was 46 years old and had aortic stenosis and congestive failure, developed ventricular fibrillation during insertion of the valvotome. Valvotomy with subsequent attempts at cardiac resuscitation was unsuccessful.

In patients with pronounced left ventricular hypertrophy, the myocardium appears to be very susceptible to ventricular fibrillation possibly because of the relative coronary insufficiency and myocardial ischemia. The manipulation required to insert the valvotome in such instances is likely to produce fibrillation in spite of the use of depressants such as quinidine or procaine amide. Thus it appears that valvotomy should be recommended to patients with acquired aortic stenosis before advanced stages of deterioration and myocardial decompensation occur. From our study of autopsy specimens it appears that

operation upon patients with advanced calcific stenosis is unsatisfactory. In 1 such specimen the valvulotome was badly damaged by attempting to fracture a densely calcified valve and withdrawal of the instrument through the ventricular wall would have injured seriously the myocardium, possibly to a fatal degree. After valvotomy upon a calcified, rigid valve, there is a tendency for it to spring back into its original shape without relief of stenosis.

Two patients with congenital aortic stenosis have been operated upon with gratifying results. The first patient was a 6 year old boy who had several episodes of syncope prior to operation. Valvotomy was well tolerated, and since surgery he has remained entirely well. The second patient with a congenital stenosis was a 10 year old boy with moderate cardiac enlargement and physical incapacity. Temporary cardiac arrest occurred during valvotomy, but after the instrument was withdrawn, cardiac massage restored heartbeat and recovery was uneventful. Since operation this patient has developed mild aortic insufficiency, but he is active and free of symptoms.

In patients with congenital aortic stenosis the obstruction may be located in the valve itself or in a subvalvar zone where a fibromuscular membrane may obstruct the aortic outflow tract. In the strictly valvar lesion aortic insufficiency of moderate degree may occur after valvotomy whereas in subaortic stenosis the valve ring may be guarded by a relatively normal valve. Rupture of the subvalvar membrane in this instance would not produce aortic regurgitation. Unfortunately, methods to make this distinction between valvar and subvalvar stenosis prior to operation have not been satisfactory, and it appears to be justifiable to perform a surgical dilatation of the valve ring in those patients with progressive severe symptoms of congenital aortic stenosis even though mild aortic regurgitation may be produced. Further experience with congenital aortic stenoses is necessary before specific recommendations may be given in the selection of such cases for operation.

SUMMARY

During the past five years surgical procedures have been developed for the relief of congenital and acquired stenosis of the mitral and aortic valves.

This report deals with 115 patients undergoing either mitral or aortic valvotomy between March, 1951, and November, 1953. In 110 valvotomies for mitral stenosis there have been 10 deaths giving a fatality rate of 9 per cent. Eight patients died during the first ten days after operation, and death occurred in 2 patients one and four months respectively following operation. Thrombosis and embolism accounted for death in 9 of the 10 patients who died following operation. Clinical results in 74 per cent of the survivors was good to excellent, and many were restored to normal activity with nearly complete disappearance of murmurs.

Although the risk of operation is somewhat increased in severely incapacitated patients with mitral stenosis, particularly in the advanced age group, valvotomy has produced striking improvement in the majority of such patients. Ages of patients ranged between 16 and 58 years, but good results were obtained more uniformly in patients 25 to 35 years of age. Other factors such as history of previous embolism, auricular fibrillation, valvar calcification, and associated valvar lesions deserve consideration in the evaluation of patients for valvotomy but should not contraindicate operation in the presence of mitral stenosis. Five pregnant patients with mitral stenosis have been operated upon successfully with subsequent normal delivery. The tendency for severe stenosis to recur after successful mitral valvotomy appears to be relatively insignificant.

Aortic stenosis is a more complex problem to the cardiologist and surgeon, but valvotomy may relieve symptoms of reduced cardiac output in properly selected cases. In 5 patients undergoing aortic valvotomy, the lesion was acquired in 3 and congenital in 2. Two critically ill patients with acquired stenosis did not survive operation, but I survived and was improved. Valvotomy produced gratifying relief of symptoms in 2 patients with congenital aortic stenosis. Patients with aortic stenosis should be considered for operation before the development of marked cardiac enlargement and accompanying coronary insufficiency.

HEART DISEASE IN PREGNANCY

FRANCIS F. ROSENBAUM, M.D., F.A.C.P., Milwaukee, Wisconsin

HEART disease in pregnancy has assumed a more important position as the frequency of other causes of maternal mortality has been reduced. As a result, cardiovascular disease is responsible for about one-fourth of maternal deaths occurring in this country today. There are signs which suggest that this mortality is not irreducible.

The fundamental studies regarding the basic physiologic changes in the cardiovascular system during pregnancy are becoming more widely appreciated. This knowledge, together with the growing awareness of the need for cooperative, careful prenatal attention by the obstetrician and internist or cardiologist, has already brought the mortality down to such low figures as the 0.64 per cent recently reported by Gorenberg and Chesley.[9] Furthermore, recent advances in the treatment of mitral stenosis, coarctation of the aorta, patent ductus arteriosus, tetralogy of Fallot, and subacute bacterial endocarditis tend to make pregnancy a lesser hazard in certain patients, although it is true that new and often trying problems confront the physicians who attend these patients. For many years rheumatic heart disease has been responsible for from 90 to 95 per cent of the total of cardiac patients who become pregnant, with congenital heart disease accounting for 2 or 3 per cent and miscellaneous disorders constituting the remainder. These proportions undoubtedly will change as surgical management prolongs the life of patients with congenital cardiac defects and preventive measures of various types reduce the incidence of rheumatic heart disease.

From the Department of Internal Medicine, Marquette University School of Medicine; the Milwaukee County General Hospital; Columbia Hospital; and Milwaukee Hospital.

Read before the Section on Obstetrics and Gynecology, Texas Medical Association, Annual Session, Houston, April 28, 1953.

CARDIOVASCULAR LOAD OF PREGNANCY

The burden which pregnancy imposes upon the heart may be understood from table 1, which summarizes the changes occurring in the cardiovascular system. Although the causes of these alterations are not fully understood, they are probably related to endocrinologic modifications attending the pregnancy with accompanying retention of salt and water. The increased blood volume is primarily an increase in plasma volume. Furthermore, the studies recently reported by Berlin and his associates[3] using erythrocytes labeled with radioactive phosphorus (P^{32}) have shown a definite decrease in total red cell volume in the first trimester followed by a slow rise to a maximum in the ninth month. This is followed by a decrease prior to delivery and a further 300 cc. fall at delivery. The plasma volume begins to rise in the second month and also reaches a maximum at the ninth month. Again, a fall precedes delivery with an additional 700 cc. drop at delivery. Berlin and his coworkers reported an average increase of more than 1,300 cc. in the total blood volume during pregnancy.

TABLE 1.—*Changes in Circulatory Dynamics in Pregnancy.*

Increased total blood volume (1-1.3 L.)
Increased cardiac output (25-40%)
Increased cardiac work (50%)
Increased oxygen consumption (15-25%)
Accelerated circulation rate
Decreased arteriovenous oxygen difference

Burwell and his associates[6] developed the hypothesis that the placenta behaves much like an arteriovenous aneurysm and that the circulatory dynamics are altered accordingly. It is believed that this alteration may be one of the participating mechanisms, but the retention of salt and water is as important, or more so. This latter circumstance lends itself to alteration by medical means if the patient should develop congestive heart failure during the pregnancy.

The feature which seems of greatest practical importance in the cardiovascular changes accompanying pregnancy is that the load upon the heart reaches a peak at from thirty-two to thirty-six weeks. There is then a gradual drop in the last lunar month. A curve

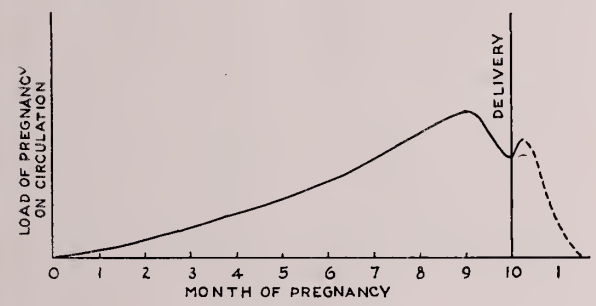

FIG. 1. A graph representing the postulated load of pregnancy upon the circulation. Note that the peak occurs at the ninth lunar month and a significant fall precedes delivery. A small second peak occurs in the early postpartum period. (Modified from Hamilton, B. E., and Thomson, K. J.: Heart in Pregnancy and Childbearing Age, Boston, Little, Brown and Co., 1941.)

representing this load has been developed by Hamilton and Thomson[10] (fig. 1). If this curve is kept in mind, it is of help in managing pregnant cardiac patients. For many years when congestive heart failure developed during pregnancy, there was an inclination to terminate the pregnancy, often by cesarean section, at exactly the point on this curve when the load is greatest to spare the patient what was thought to be the greater burden at full term. It is appreciated now that the load lessens markedly during the last month and that the patient is really in a more favorable state at full term.

When the load of pregnancy upon the circulation is understood, it becomes clear why many normal women develop certain manifestations which suggest heart disease. These include dyspnea, palpitation, pulmonic and apical systolic murmurs, apical third heart sounds, tachycardia, full pulses, and a seeming increase in the size of the heart. When patients have not been examined prior to pregnancy, it is necessary to evaluate these manifestations with some care in order to avoid an erroneous diagnosis of structural heart disease.

EVALUATION OF PATIENT

Several plans for evaluating particular patients in pregnancy have been proposed. Such systems of classification are of great usefulness since they permit the attending physicians to anticipate difficulties, particularly congestive heart failure, in certain classes of patients. In addition they are of help in advising patients, whether or not the burden of pregnancy should be undertaken. The New York Heart Association developed a classification applicable to patients with heart disease.[15] There are four classes of patients under this system according to their functional capacity. Class 1 consists of those persons with heart disease who have no limitation of physical activity. Class 2 is made up of those who have slight limitation of physical activity. Class 3 is for those patients who have marked limitation of physical activity, and class 4 consists of those patients who are unable to carry on any physical activity without discomfort. General experience has shown that patients in classes 1 and 2 usually tolerate pregnancy well. The risk of pregnancy, particularly the development of congestive heart failure, is much greater for patients in classes 3 and 4.

TABLE 2.—*Duration of Rheumatic State and Incidence of Heart Failure During Pregnancy.*

Duration of Rheumatic State (Yr.)	Pregnancies (No.)	Pregnancies with Failure (No.)	(%)
0-9	40	2	5
10-19	77	15	19.3
20-29	36	14	38.8
30+	6	5	83.3

Hamilton and Thomson[10] proposed classification of cardiac patients into unfavorable and favorable groups insofar as the hazard of pregnancy is concerned. The unfavorable category is made up of those who have (1) signs or history of heart failure, (2) a dangerous disorder of the heart beat such as auricular fibrillation, or (3) a complicating serious disease. Women with heart disease who do not have any of these criteria are considered favorable risks. The experience of Hamilton and Thomson with the first 750 cardiac patients delivered at the Boston Lying-In Hospital indicated a mortality rate of 3.5 per cent for the patients in the favorable class and 16.7 per cent for those in the unfavorable class.

It is generally believed that rheumatic fever is a disease which has a rather definite natural history consisting of four phases: (1) the initial attack characterized by arthralgia, carditis, chorea, and other rheumatic manifestations; (2) a subacute phase during which recrudescences are frequent; (3) an inactive phase, usually from puberty to the fourth or fifth decade, during which functional capacity is usually good; and (4) a final phase characterized by pro-

gressive reduction in functional capacity with ultimate congestive heart failure and death. The development of auricular fibrillation often signals the onset of the fourth phase.

Bunim and Rubricius[5] have recommended that by establishing the position of the patient in the natural course of rheumatic heart disease, the possibility of congestive failure can be prognosticated and the risk of pregnancy may be estimated. The risk of pregnancy, particularly the possibility of congestive failure, is much greater when the patient has entered the fourth phase of rheumatic disease. In 1950, Correll and I[7] reported observations made in 52 women with rheumatic heart disease who had four or more pregnancies. It may be seen from table 2 that congestive failure occurred in only 5 per cent of those pregnancies which occurred within nine years of the onset of rheumatic fever, whereas failure developed in 83 per cent of the pregnancies which occurred thirty or more years after the onset of rheumatic fever.

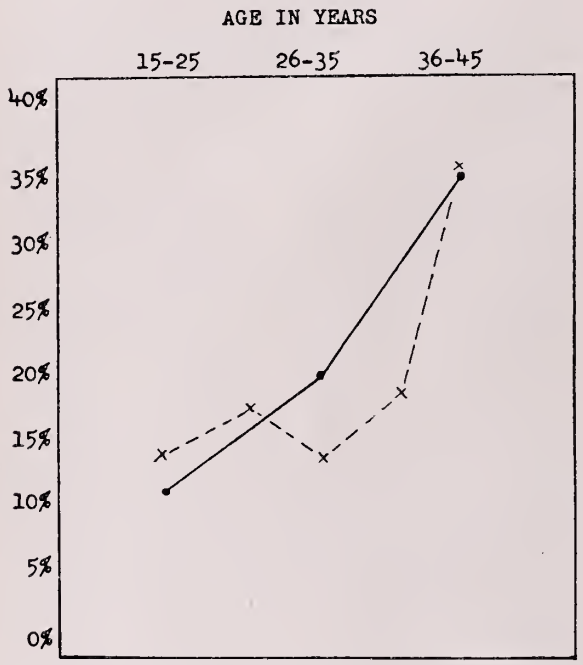

FIG. 2. A graph showing the incidence of congestive heart failure during pregnancy in patients with heart disease, which indicates the increasing frequency of this complication as the patient grows older. Solid line represents studies of Correll and Rosenbaum.[7] Dotted line indicates observation of Hamilton and Thomson.[10] (After Correll, H. L., and Rosenbaum, F. F.: Multiple Pregnancies in Patients with Rheumatic or Congenital Heart Disease, Am. Heart J. 39:283-297 [Feb.] 1950.)

It is of value to survey a single patient from many points of view when the risk of pregnancy is being estimated. In addition to classifications such as those described, specific features may be evaluated. The age of the patient is probably more important than any other single factor. Hamilton and Thomson observed a sharp increase in the incidence of heart failure in pregnancy at age 35 years, the frequency of this complication doubling in the older patients. Bunim and Rubricius[5] have confirmed this, and our observations (Correll and Rosenbaum[7]) in the special group of patients mentioned earlier support this belief (fig. 2).

A feeling in some quarters that the outlook is more serious if the size of the heart exceeds the predicted normal by 10 per cent exists; however, there is some difference of opinion on this point.[4, 5] I recently have followed the progress of a woman, aged 33 years, with aortic stenosis and insufficiency and mitral insufficiency through her third pregnancy. The heart was at least 60 per cent larger than the predicted normal and electrocardiograms showed evidence of pronounced left ventricular hypertrophy. Nevertheless, the pregnancy was uneventful and delivery uncomplicated. The first attack of rheumatic fever had occurred twenty-four years earlier. Striking exceptions to rules, such as this, are uncommon.

There is also no complete agreement concerning the prognostic significance of the type of valvular involvement.[5, 10] One of the greatest hazards is acute pulmonary edema which may occur without warning and prove rapidly fatal in women with mitral stenosis. Bramwell[4] and Jones[11] both have called attention to this condition and emphasized that it is apt to occur when normal sinus rhythm is present, probably as the result of abrupt left auricular failure.

Auricular fibrillation increases the death rate by as much as four times.[4] In one large series of cardiac patients with unfavorable prognosis, who had auricular fibrillation either established or transient, the maternal death rate was 33⅓ per cent.[10] However, Bramwell recently has expressed the opinion that auricular fibrillation is not a bar to pregnancy if observation and adequate treatment are possible. It is my own belief that this disorder of rhythm is both an unfavorable sign and an index of the final phase of the natural history of rheumatic disease. Pregnancy should be undertaken or continued in the face of this arrhythmia only with a full appreciation by all concerned of the risk involved.

There is a growing body of evidence that parity per se is not a vitally important factor in prognosis in these patients.[9, 10, 11] Our study (Correll and Rosenbaum[7]) was initiated as an attempt to determine the relationship of parity to prognosis. We observed 10 patients who had had ten or more pregnancies carried to term. No clear correlation could be worked out between the incidence of heart failure and increasing parity (table 3). It must be borne in mind that with each succeeding pregnancy the patient is older and the rheumatic state of greater duration, factors which

TABLE 3.—*Correlation of Increasing Parity with Incidence of Heart Failure.*

After Correll, H. L., and Rosenbaum, F. F.: Multiple Pregnancies in Patients with Rheumatic or Congenital Heart Disease, Am. Heart J. 39:283-297 (Feb.) 1950.

already have been shown to affect appreciably the course of pregnancy.

If the patient has had previous pregnancies, a detailed description of their course is helpful. If heart failure has occurred in a previous pregnancy, there is a 50 to 75 per cent chance of its recurrence in succeeding pregnancies.[7, 8] In some series this recurrence rate has been as high as 89 per cent.[19] Not only does congestive failure recur but there is evidence to suggest that it appears earlier and is of more severe degree with each successive pregnancy. It is believed by many observers that patients with acute rheumatic fever present an unusually high risk, and if the diagnosis can be made unequivocally early in pregnancy, termination is indicated.[13] In evaluating any patient's status it is well to estimate the functional capacity on the basis of what the patient was able to do in her ordinary routine of living prior to the pregnancy.[4] It is well to keep in mind, however, that the functional capacity may change from time to time during the pregnancy.

MANAGEMENT OF PREGNANCY

The most important principle to keep in mind in the management of these patients is that they must be seen often and watched carefully. It is my own practice on each visit to review the symptoms, asking particularly about unusual dyspnea, cough, hemoptysis, palpitation, sudden gain in weight, or unexpected edema of the ankles. Furthermore, there should be a careful examination, including measurement of the blood pressure and vital capacity; and search for basillar rales; changes in the cardiac sounds, murmurs, or rhythm; and enlargement of the liver. The appearance of basillar rales and a gradually diminishing vital capacity may foretell congestive failure before the patient is aware of any change in symptoms. Patients with heart disease should be advised to limit weight gain to 20 pounds, to restrict the sodium intake moderately throughout pregnancy, to do that amount of housework and physical activity which can be performed with ease and comfort and without undue fatigue or dyspnea, and to take daily rest periods. If any infection occurs, the patient should take to her bed at once and appropriate treatment should be started. Respiratory infections are particularly prone to precipitate congestive heart failure in these patients.

If congestive heart failure appears, the patient should be hospitalized and treated in the usual way. It is probably wise to keep such patients in the hospital throughout the remainder of pregnancy. This is often difficult because of the economic burden imposed, and patients resist such confinement because they feel so well when the heart failure is relieved. The following case illustrates this point.

CASE 1.—L. Z., aged 34 years, was seen initially April 25, 1947, during the fifth month of her third pregnancy. The previous pregnancies eight and five years earlier were associated with considerable dyspnea during the last trimester. Features of mitral stenosis were present (fig. 3).

Hemoptysis and severe dyspnea appeared abruptly during

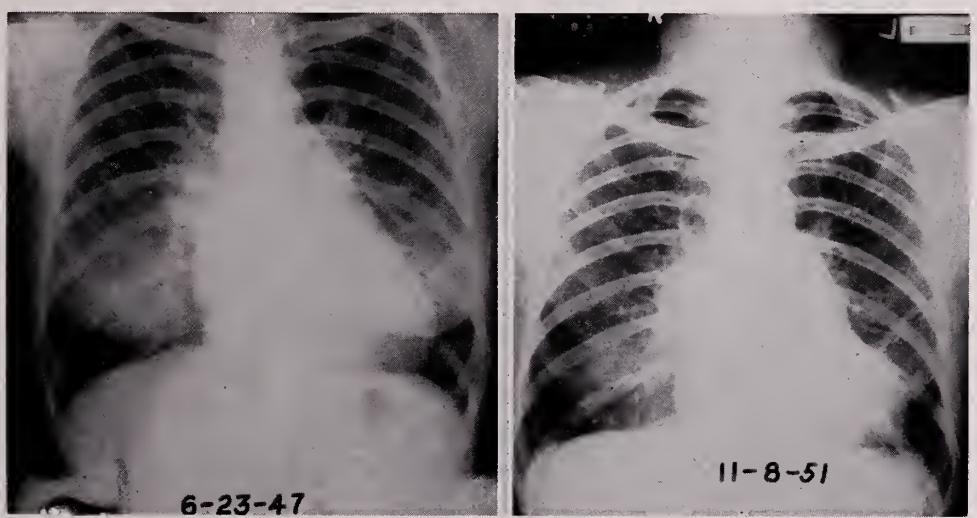

FIG. 3. Case 1. Woman, aged 34 years, with rheumatic mitral stenosis. *Left.* Roentgen study of the heart during the seventh month of the third pregnancy. The cardiac silhouette has typical mitral configuration. Delivery was complicated by nearly fatal acute pulmonary edema. *Right.* Roentgen study of the heart four months after successful mitral valvulotomy shows some decrease in cardiac size.

the seventh month, and the patient was admitted to the Milwaukee Hospital. Prompt improvement followed application of the usual measures. The patient left the hospital at her own insistence three weeks after admission. There was some increase in peripheral edema thereafter but the lungs remained clear.

Six weeks after discharge she was readmitted for induction of labor. Shortly after rupture of the membranes with subsequent rapid progress, the patient developed overwhelming acute pulmonary edema so severe that she appeared moribund. Delivery was so rapid and the patient's condition so poor that the spinal anesthesia which was planned was not used. Atropine, aminophyllin, venous tourniquets, and oxygen administered under positive pressure did not alter her condition. Improvement followed venesection with withdrawal of 500 cc. of blood.

The patient subsequently recovered and went on to develop severe, chronic congestive failure. A mitral valvulotomy was performed by Dr. Dwight Harken July 5, 1951, and the patient currently is in satisfactory condition.

If this patient had been kept in the hospital from the time of first admission until the delivery, it is probable that acute pulmonary edema would have been avoided. This case illustrates the suddenness with which the complication may arise in pure mitral stenosis and the value of phlebotomy as well. I have seen a similar case in an elderly primipara with mitral stenosis and auricular fibrillation who undertook a pregnancy despite the advice of many physicians to the contrary. Phlebotomy was again life saving. If it is remembered that the total blood volume is increased by more than one liter during pregnancy, the load upon an embarrassed circulation may be appreciated and the relief afforded by venesection understood. It is a measure which too often is not considered or felt to be outmoded.

It is perhaps well to point out that because of this increase in the total blood volume, the parenteral administration of fluids or blood must be undertaken with great caution and a full understanding of the hazard. Acute pulmonary edema of alarming degree has been observed when such measures have been used to overcome dehydration or anemia in pregnant women with mitral stenosis.[17]

It is often gratifying to observe how well some patients will tolerate the load of pregnancy when at first appraisal the risk would seem prohibitive. This point is illustrated by the following case.

CASE 2.—J. R., aged 21 years, was first seen January 3, 1949, during the third month of her first pregnancy. A murmur had been first detected when she was six months of age; a deformity of the spine had appeared at the age of 10 years. There was an extremely severe right dorsal, left lumbar kyphoscoliosis, and the cardiac findings were characteristic of an interventricular septal defect (fig. 4).

The patient was seen at two week intervals throughout pregnancy. The vital capacity, which was 1,000 cc. on first determination, never fell below 850 to 900 cc. A few, transient rales, moderate dyspnea, and fatigue appeared during the last trimester, but these changes were never severe enough to cause concern. A normal infant was delivered by mid-forceps July 20, 1949, and the postpartum period was uneventful.

In this instance the risk of continuation of the pregnancy was discussed at length with the patient and her husband. She was cooperative in following the recommendations given her by the obstetrician and me. Such cooperation by all concerned is imperative, if such high risk patients are to be carried through pregnancy successfully.

Patients with congenital heart disease present certain special problems. Girls with tetralogy of Fallot reach the childbearing age frequently, yet pregnancy can be a great burden for them. The development of surgical procedures for the amelioration of this condition has lessened this burden. Successful outcomes

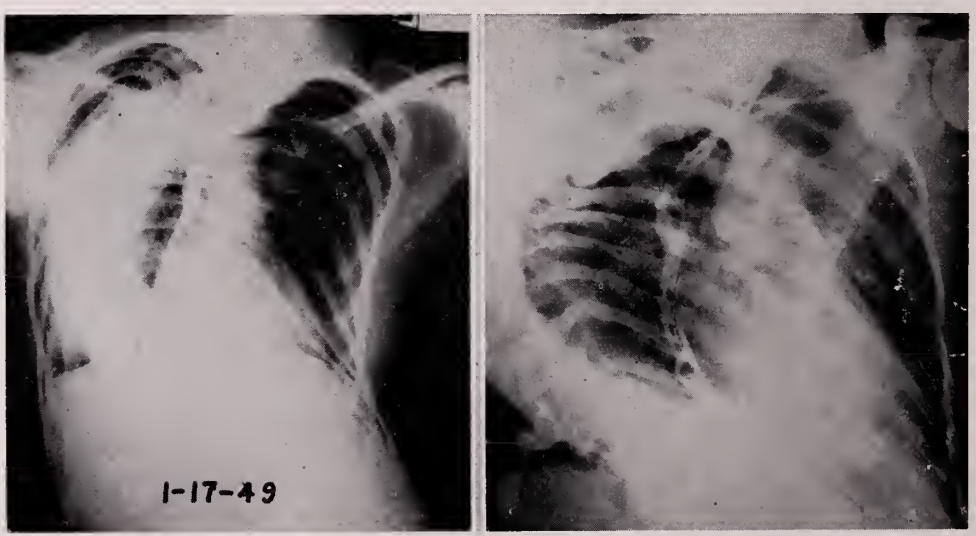

FIG. 4. Case 2. Woman, aged 21 years, with interventricular septal defect and severe kyphoscoliosis. Roentgen studies of the heart and thorax during the third month of the first pregnancy. *Left.* Antero-posterior view. *Right.* Right anterior oblique view. Gross distortion of the spine is easily seen. An uncomplicated pregnancy concluded with a normal fetus delivered at full term.

FIG. 5. Case 3. Woman, aged 24 years, with tetralogy of Fallot. Electrocardiograms recorded during the fourth month of a first pregnancy show classic changes of pronounced right ventricular hypertrophy.

of pregnancy after the Blalock procedure have been recorded by Russell and his associates[18] and by Olim and Turner.[16] The following case illustrates a successful pregnancy in this disorder without any such operative procedure.

CASE 3.—M. P., aged 24 years, was first seen June 18, 1952, during the fourth month of her first pregnancy. Cyanotic heart disease had been recognized since infancy. Although unable to participate in sports of any kind, the patient had been able to attend grammar school and to carry out light household duties thereafter. The clinical features were characteristic of tetralogy of Fallot and electrocardiograms suggested pronounced right ventricular hypertrophy (fig. 5 and 6).

The entire pregnancy was uneventful. Cyanosis of moderate degree was present throughout, but it did not increase in degree. The vital capacity never changed appreciably from the 2,600 cc. recorded on the initial examination. A normal infant was delivered vaginally at full term with no complications.

Some concern was felt about the infant in this case, since Olim and Turner[16] reported anencephaly in 2 fetuses of a mother with tetralogy of Fallot only a short time after my patient was seen initially. In this report attention was called to the possibility that the low oxygen tension in the mother's blood may affect the cephalic phase of development adversely, drawing a parallel with the experimental production of anomalies by maternal insult in the form of anoxic anoxia. Fortunately, my patient was delivered of a normal infant. In a series of more than 10 patients with congenital heart disease, followed through pregnancy in

FIG. 6. Case 3. Roentgenographic study of the heart shows cardiac configuration of surprisingly normal contour even though the patient was distinctly cyanotic and had electrocardiographic evidence of right ventricular hypertrophy. A normal fetus was born at full term after uncomplicated pregnancy.

the past six years, only a single abnormal fetus was born of an elderly primipara with a patent ductus arteriosus but no evidence of cyanosis.

A new problem in this field is the management of patients with mitral stenosis who have successful valvulotomy and become pregnant thereafter. Massey[13] indicates that at least a score of such patients have come to his attention. He also mentions a successful commissurotomy performed by Rumel during pregnancy. This procedure also has been accomplished by Baker, Brock, and Campbell[1] and by Logan and Turner.[12] Such a case is described briefly through the courtesy of Dr. Donald M. Willson.

CASE 4.—A. P., aged 32 years at the time of delivery, had had rheumatic fever at 17 years of age. The mitral stenosis which resulted limited her activities severely. Congestive heart failure and auricular fibrillation developed in 1950. In November, 1950, the patient had an embolus to the right popliteal artery (fig. 7). A mitral commissurotomy performed by Dr. Charles Bailey in January, 1951, was followed by a striking improvement in function so that the patient undertook all normal activities. The auricular fibrillation present prior to operation persisted unchanged. The patient became pregnant one year after the operation and delivered a normal infant after an entirely uneventful pregnancy.

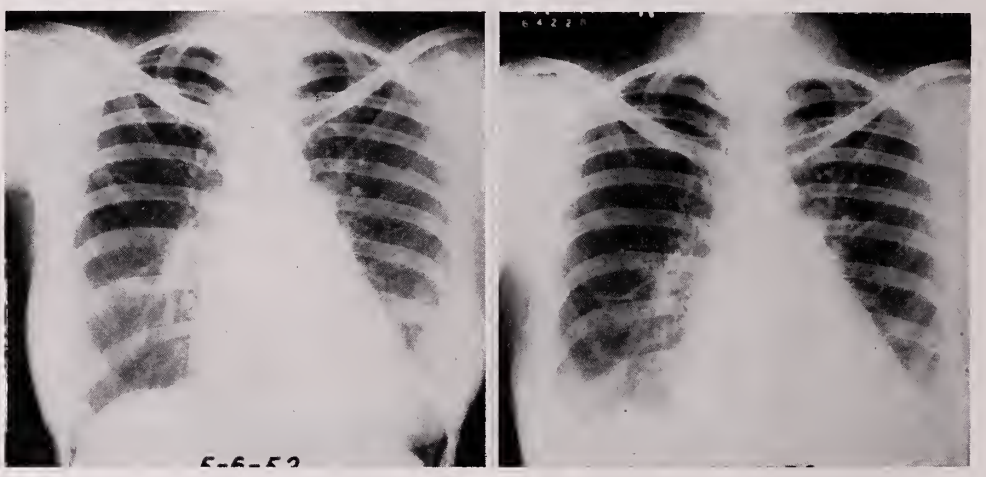

FIG. 7. Case 4. Woman, aged 32 years, with mitral stenosis and successful mitral commissurotomy performed in January, 1951. *Left.* Roentgenographic study of the heart during pregnancy, which began slightly more than one year after commissurotomy. *Right.* Roentgenographic study of the heart at full term shows mitral configuration and apparent slight increase in the size of the heart as compared with the earlier roentgenogram. A normal fetus was born at full term after an uncomplicared pregnancy.

More and more of these patients will present themselves in the future. The criteria for the risk of pregnancy must be altered in these women because the structural valvular disorder has been altered. Evaluation must be based upon the postoperative functional capacity. It is probably wise that such patients wait at least one year after operation for full benefit to develop and to permit a proper evaluation by the physician before pregnancy is undertaken.

In 1951, McRoberts[14] reported several cases in which the dorsal recumbent position during pregnancy produced discomfort and circulatory collapse. The following case seems related to this situation and is reported as an illustration of the type of problem which often causes the obstetrician some concern.

CASE 5.—E. D., aged 22 years, was seen first March 9, 1949, during the eighth month of her first pregnancy. One month earlier when placed in the dorsal recumbent position in the office of her obstetrician she had become faint and dyspneic, and tachycardia had appeared. The symptoms cleared promptly when she sat up.

The sensations recurred one month later under the same circumstances. On three separate occasions during March, 1949, the heart rate was observed to increase from levels of 75 to 88 per minute on first assuming the dorsal recumbent position to 152 to 164 per minute within three to seven minutes (fig. 8). The rate returned abruptly to normal levels when the patient turned to the left lateral position. However, at the time of labor the phenomenon was less pronounced and delivery was carried out in the usual way.

The patient is now in the course of a second pregnancy. During the eighth month of this pregnancy, the heart rate rose from 84 to 114 per minute while she lay flat on the examining table.

The explanation for such cases is obscure. McRoberts has suggested that obstruction of venous return from the lower extremities results from pressure by the pregnant uterus with the patient in the supine position. The resultant fall in right auricular pressure then results in a decreased cardiac output. If this hypothesis is true, it should be possible to reproduce the symptoms by application of venous tourniquets to the thighs even with the patient on her side. I have not had the opportunity to make this observation.

MANAGEMENT OF LABOR

The actual management of labor in patients with heart disease need not be dealt with in detail except

to point out a few important principles. With the exception of coarctation of the aorta, cesarean section should be performed in patients with heart disease solely for obstetric indications. The choice of the anesthetist is more important than the choice of anesthesia, although the agent should be one which permits a fairly high concentration of oxygen and which is not prone to excite cardiac arrhythmias. I have a personal preference for ether anesthesia in these patients.

The second stage of labor should be shortened judiciously. Some years ago Barker[2] suggested the application of venous tourniquets to all four extremities after delivery of the placenta. I have adopted this practice with the thought that contraction of the uterus forces blood into the general circulation abrupt-

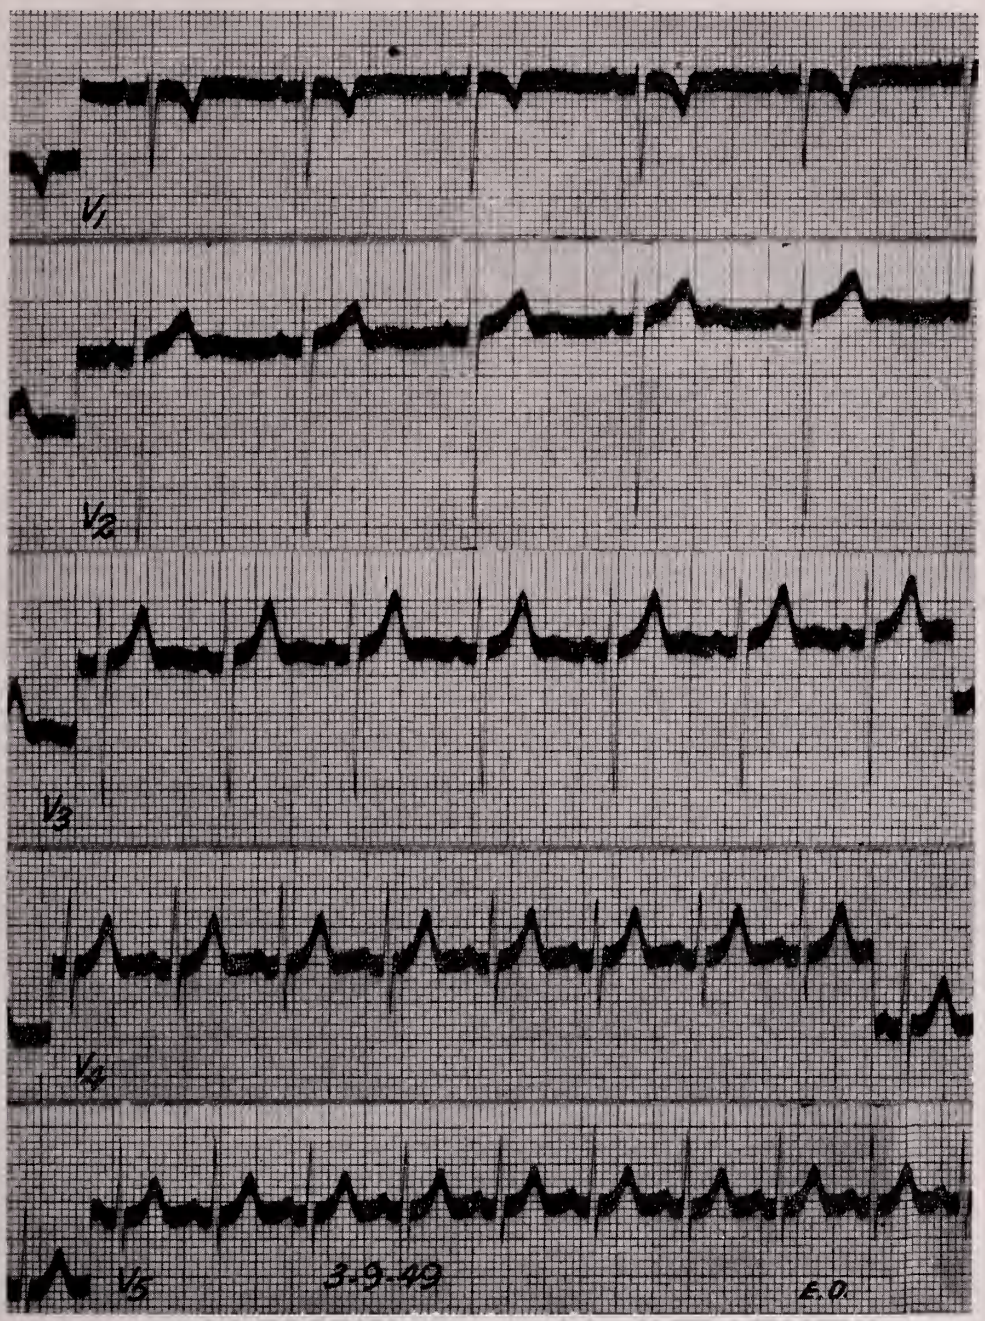

FIG. 8. Case 5. Woman, aged 22 years. Electrocardiographic observations were made during the eighth month of a first pregnancy. Marked sinus tachycardia was observed repeatedly when the patient assumed the dorsal recumbent position. Records shown were taken in rapid succession with the patient lying on her back. Lead V_1 shows a ventricular rate of 66 per minute. Subsequent records show progressive increase in the heart rate to 116 per minute in lead V_5. At times the rate rose to 164 when the patient assumed this position.

ly, and by exclusion of a large volume of blood in the extremities for one or two hours patients may be carried through a potentially dangerous, immediate postpartum period.

Prophylaxis with antibiotic agents against the possibility of subacute bacterial endocarditis has been my practice, and in my modest series of patients this complication has not occurred. Penicillin usually is given for five to seven days after delivery.

Most observers are agreed that early ambulation has no place in the treatment of cardiac patients.[8, 13] It must be remembered that there is a rebound in the load of pregnancy following delivery (fig. 1), and the postpartum period is also a hazard to these patients.

Fetal mortality in mothers with heart disease tends to be high. Although only slightly higher than in normal mothers in uncomplicated pregnancies, the rate may be as high as 30 per cent when congestive failure occurs.

CONTRAINDICATIONS TO PREGNANCY

The contraindications to pregnancy are those features which aggravate the risk of pregnancy far beyond the average. They include a past or present history of congestive failure, acute rheumatic fever, failure appearing in the first trimester, and most instances of auricular fibrillation. Economic, religious, and social factors must always be taken into account. If a pregnancy is terminated, this should be accomplished before the fifth month because a hysterotomy after that date may prove more hazardous and complicated than delivery at term.

SUMMARY

The current understanding of the physiologic load of pregnancy has made more intelligent the physician's approach to the cardiac patient who becomes pregnant. New advances in the treatment of heart disease have brought new problems in this special field because patients who could not previously withstand the load of pregnancy are now being made able to do so. The close cooperation of the obstetrician and the internist or cardiologist has become even more important in the proper management of these cases.

ABSTRACT OF DISCUSSION

DR. E. A. CHANDLER, Houston: Dr. Rosenbaum has outlined the latest methods of management of heart disease in pregnancy, and it behooves all of us to use his teachings.

More than fifteen years ago, when I first began seriously to study heart disease in pregnancy, less was known than today and there was little agreement as to the proper management of these cases. Now there is a better understanding and knowledge of heart disease, and more definite agreement on conduct of these patients through the various stages of pregnancy and delivery. Treatment of rheumatic heart disease has improved, more knowledge has been gained about the physiologic changes during pregnancy, and much valuable cardiovascular surgery has been developed. All of these factors have been of great benefit.

Most of the mortality of heart disease in pregnancy has been caused by lack of cooperation (patients' fault), and lack of ability to evaluate and predict the outcome of each case and lack of proper attention to patients during labor and the immediate postpartum period (doctors' fault). In order to improve mortality rates physicians must continue to educate the public and themselves and to practice eternal vigilance in the conduct of pregnancy and labor.

ESSAY CONTEST ON CHEST DISEASE

The American College of Chest Physicians will present three awards for the best original contribution, prepared by any student in an accredited medical school, on any phase of the diagnosis and treatment of chest disease. Each winner will be given a certificate of merit, and the first place winner will also receive a cash award of $250 at the twentieth annual meeting of the college in San Francisco June 17-20.

Deadline for the manuscript to be submitted to the executive director of the college, 112 East Chestnut Street, Chicago 11, is March 15.

TOBACCO ADDICTION
A Suggestion as to Its Remedy

CHARLES T. BROWN, Lt. Col., MC, USA, Fort Sam Houston, Texas

MARK TWAIN once remarked: "It is easy to give up tobacco; I have quit a thousand times." The humor in his statement cannot be denied; however, it seriously reflects the experience of the older smoker who has spent a good part of a lifetime in the consumption of more than one-half million cigarettes. Such a person is in a good position to elaborate on literally hundreds of attempts on his part to abandon the poison threatening his very existence. Similar unsuccessful attempts by millions of other tobacco users since the time of Raleigh would indicate once more that the substance under discussion is not to be dealt with lightly. The user of tobacco who wishes to refute the addicting qualities of this drug has only honestly to examine his own experience.

TOBACCO: A NARCOTIC

Tobacco is a narcotic capable of producing tolerance, dependency, and withdrawal phenomena in those persons accustomed to its use. Thus, it fulfills the requirements for the definition of an addicting substance. The skeptic who is unwilling to accept this fact will find solace in the words of Sollmann,[2] who writes of the toxic effects of the active principle of tobacco, the alkaloid nicotine:

> Nicotine is one of the most fatal and rapid of poisons; the vapors arising from a glass rod moistened with it and brought near the beak of a small bird causes it to drop dead at once, and 2 drops placed on the gums of a dog may give a similar result.... It acts with a swiftness equalled only by hydrocyanic acid.

Aside from its addicting properties, there appears to be ample evidence that there is a relationship between tobacco and physical disease. Carcinoma of the lung, coronary and peripheral vascular disease, nutritional and nervous disorders, peptic ulcer—all are the vade mecum of nicotine, and their unnatural alliance cannot be denied or ignored.

It is a strange commentary on the public at large, and especially on the medical profession as a class, that despite repeated and pointed warnings in both lay and professional literature of the deleterious and even fatal implications of tobacco addiction, use of the drug continues in rising proportion. This has been the history of other narcotics. The extensive use of opium and its derivatives began in this country just prior to the Civil War and continued to spread unabated until its curtailment by the enactment of the Harrison Narcotic Act in 1915. Another narcotic, barbituric acid, first synthesized by Fischer in 1903, after half a century became known as a dangerous substance with addicting properties and other lethal potentialities. Cannabis, popularly known as marihuana, was not classed as a narcotic until the passage of the Marihuana Tax Act in 1938. Similar legislation and restrictions finally were applied to meperidine and other synthetics and later to mescaline and peyote. Another narcotic, alcohol, needs no comment here.

Certainly, tobacco and heroin should not be placed in the same company; however, under certain conditions a .22 rifle has been known to possess all the lethal potentialities of a .50 caliber machine gun. The man dead of carcinoma of the lung after years of heavy cigarette smoking and his brother whose death is the result of heroin deprival may well be from a standpoint of toxicology in *status quo*. The essential differences in the causative agents of their demise can be argued and delineated from a standpoint of pharmacology by professors in the classroom; nevertheless, the fact remains that the agents of their deaths could well be the addicting drugs of their respective choice. And as Metchnikoff said: "Man does not die; he poisons himself."

The question of motivation is paramount in the determination of any form of behavior. The person who desires to achieve worth-while goals must be prepared to make certain sacrifices ranging from minimal to heroic, depending upon the nature and magnitude of his undertaking. The renunciation of tobacco for some is a simple task; for others the task is of Herculean proportion. Unfortunately, the work to be done often is rendered no less easy by news of a heart disease or a suspicious lung lesion that portends catastrophe. The scheme that follows is not for the strong who wear their chains lightly; rather, it is for the miserable slave whose shackles bruise and grow heavier with the passing of the years.

SUGGESTED REMEDY

Some 200 years ago, a venerable apothecary of London whose name has been lost in obscurity, becoming alarmed over the increasing prevalence of "snuff taking" and its deleterious consequences, offered a remedy for those afflicted with what he considered to be an unwholesome pastime. It is the purpose of this

From the Department of Neuropsychiatry, Medical Field Service School, Brooke Army Medical Center.

paper to present the proposed remedy as a simple and effective approach to the abandonment of tobacco. The plan is unique in that it paradoxically allows the tobacco addict to continue the use of the drug while in the process of its complete renunciation. The plan of treatment is as follows:

The patient proceeds upon a planned schedule with the determination to adhere faithfully to its simple provisions. The principle involved is the progressive reduction of the tobacco intake by one hour each day. The subject, for example, arises at 6 a. m. and will thus embark upon his reduction at that hour for the first day. He starts smoking at 6 a. m. and may smoke all that he chooses until midnight, or thereabouts, when he normally retires for the night. The next morning, or the second day of the treatment plan, he moves his smoking time up one hour to 7 a. m. Again, he may smoke all that he desires until midnight. On the third day he moves his smoking activities up until 8 a. m., and so on successively to the end that smoking is delayed by one hour each day until the subject reaches midnight of the final day. He is now aware of the fact that during the eighteen day period he has progressively diminished his smoking time by one hour each day and finds that on the last day he has only one hour, from 11 p. m. until midnight, to indulge in smoking. Again, he may smoke all he wishes during this final hour. At its conclusion, he retires to bed having completed the reduction treatment.

COMMENT

Obviously, the treatment as outlined in this presentation is no more than a gradual reduction procedure with the goal of detoxification common to all drug withdrawal plans. However, this plan is more than that and upon this hinges the secret of its success. In the case of tobacco, as with other narcotics, there are both psychologic and physiologic factors in addiction.

In consideration of one of the more important psychologic components of the problem, it is a well known fact that a major obstacle in the withdrawal of any narcotic is the patient's frightening prospect of an existence without support of the drug. In other conventional forms of narcotic drug withdrawals such a prospect exists throughout the treatment. However, in the plan proposed the patient is assured positively from the first day that he not only will be allowed to smoke, but will further be permitted to smoke as much as he chooses. He is required only to delay for a relatively short, though increasing, time each day his initial indulgence in tobacco. The positive assurance of unlimited smoking privileges is sufficient to sustain him through the progressively increasing period of daily abstinence.

As to the physiologic component of tobacco withdrawal, standard references on pharmacology give a detailed account of the altered physiology of each organic system incident to the ingestion of tobacco. Obviously, as the subject limits and decreases his daily intake of the narcotic and his exposure to the drug is lessened progressively each day, there will be a gradual restoration of normal bodily functions. Along with this gradual restoration of bodily health there is uniformly an abatement of the abstinence symptoms, both psychologic and physiologic, to the end that the patient has achieved a psychic and somatic tranquillity heretofore unknown in a tobacco laden atmosphere.

The question now arises as to the possibility of relapse. Experience shows the possibility of such an eventuality, for relapse in drug addictions is the rule rather than the exception. According to Otto Fenichel,[1] addicts are persons who have a disposition to react to the effects of drugs in a specific way, namely, in such a way that they try to use these effects to satisfy the archaic oral longing which is sexual longing, a need for security, and a need for the maintenance of self-esteem simultaneously. Thus, the origin and the nature of the addiction are not determined by the chemical effect of the drug, but by the psychologic structure of the patient. So the premorbid personality of the subject is the decisive factor, both as to the initial exposure to tobacco and as to the continuing use of the drug. It may be postulated that so long as tobacco fulfills some inner need or gratification to the subject or satisfies again the archaic oral longing, he will be perpetually in danger of relapse. However, one or more relapses should not be so discouraging to the patient as to persuade him that his situation is hopeless. One, or even a succession of relapses, does not necessarily mitigate against ultimate and complete success with its reward of permanent and irrevocable renunciation.

SURGEONS TO HOLD SECTIONAL MEETINGS

The medical profession at large is invited to attend any of six sectional meetings to be held by the American College of Surgeons during the first six months of 1954. Panels, symposiums, papers, and motion pictures will be presented at each session, which will concentrate on problems encountered in day-to-day practice. The meetings are scheduled as follows: February 1-3, Charlotte, N. C.; February 25-26, Reno, Nev.; March 1-4, Omaha, Neb.; March 15-17, French Lick Springs, Ind.; March 31-April 2, Montreal, Quebec, Canada; May 17-19, London, England.

Details may be obtained from Dr. H. Prather Saunders, associate director of the American College of Surgeons, 40 East Erie Street, Chicago 11.

CASE REPORTS

ENDOCARDIAL SCLEROSIS

WILLIAM L. HOWELL, M.D., Washington, D.C.

ENDOCARDIAL sclerosis, by definition, is a fibrous thickening of the endocardium. Sclerosis of the valvular endocardium is viewed with suspicion, and when discovered, it is routinely studied microscopically by pathologists. Sclerosis of the mural endocardium, however, has received scant attention, except as a striking feature of "fibroelastosis," a uniformly fatal entity occurring in infants. This is understandable as endocardial sclerosis is often an incidental finding in diseased hearts. White plaques of endocardial thickening are frequently seen overlying healed myocardial infarcts. In coronary sclerosis without infarction, arterial hypertension, valvular heart disease, congenital anomalies of the heart and coronary circulation, chronic lung disease producing pulmonary hypertension, and isolated myocarditis, more diffuse thickening is sometimes seen. Sclerosis of the mural endocardium, however, may occur in the absence of other demonstrable heart disease and be the only abnormal anatomic finding other than cardiac hypertrophy in certain patients dying of congestive heart failure.

These patients are usually young adults who develop advanced congestive heart failure within a few weeks; their previous history is asymptomatic. Clinically, these patients exhibit cardiomegaly and gallop rhythm, but show none of the stigmas usually associated with common forms of heart disease. The blood pressure is often low; retinal vessels are normal. No significant murmurs are found. The temperature, white blood cell counts, and sedimentation rates are normal. Tremors, eye signs, thyroid enlargement, and quadriceps weakness, which might indicate hyperthyroidism, are not present. There are no signs of myxedema. Roentgenograms show cardiac contours of generalized dilatation without suggestion of hypertensive, valvular, or congenital heart disease. They resemble hearts made abnormal by beriberi, but there is no response to therapy with thiamine chloride. Sooner or later embolic phenomena occur in most cases, leading to a suspicion of subacute bacterial endocarditis. Incident to infarction, fever, leukocytosis, and an elevation of the sedimentation rate strengthen this suspicion. But repeated blood cultures are negative. A poor response to digitalis is mentioned in almost all cases reported. Mercurial diuretics, cation-exchange resins, and low salt diets may help temporarily, but the course of the disease is progressively downhill. Death usually occurs within a few months to a year.

Two cases of endocardial sclerosis are presented in this report. The clinical and pathologic features of the condition are discussed.

Read before the Section on Internal Medicine, Texas Medical Association, Annual Session, Houston, April 28, 1953.

CASE REPORTS

CASE 1.—A 41 year old meat department supervisor was admitted to the hospital September 16, 1952. He complained of shortness of breath of three weeks' duration.

In 1945, early in the course of surgery for an inguinal hernia, the patient's heart ceased to beat for a short time and the incision was closed. The operation was completed successfully ten days later. His past history was otherwise negative.

The patient first noted dyspnea when he lifted a meat basket that weighed approximately 25 pounds. The following day, walking a distance of only 50 feet made him breathless. One week prior to hospitalization he had been confined to bed; on several occasions he had been forced to sit upright to breathe comfortably. On the day of admission he coughed up bright red blood.

Physical examination revealed a dyspneic, well nourished white male about 40 years of age, in bed with the head elevated approximately 45 degrees. The patient's temperature was normal, the pulse rate was 140 per minute, and respirations 30 per minute; blood pressure was 106/70. Rales were present at both lung bases. A diastolic gallop was present at the apex, but there were no murmurs. The liver edge was palpable at the umbilicus, and there was extreme tenderness in the right upper quadrant of the abdomen. There was no peripheral edema.

An electrocardiogram revealed sinus tachycardia and a left ventricular strain pattern.

A roentgenogram of the chest showed an enlarged heart and evidence of pulmonary congestion.

The patient was given digitalis, oxygen, a mercurial diuretic, and morphine sulfate, and was moderately improved within twelve hours. The pulse rate had slowed to 90, but in another twenty-four hours it had become rapid again; it was rarely below 120 per minute the remaining three months of his life despite full digitalization. Follow-up roentgenograms revealed a large pulmonary infarct to be the source of his hemoptysis. Anticoagulant therapy was instituted.

The course remained largely afebrile, and white blood cell counts and sedimentation rates were normal. Slight elevations of temperature followed embolic episodes; there were many of these. An attack of flank pain associated with microscopic hematuria, after anticoagulants had been discontinued, was interpreted as being due to renal infarction. It was thought a short period of aphasia was the result of cerebral em-

bolization. On at least four occasions it was possible to make a positive diagnosis of recent pulmonary infarction.

Repeated blood cultures were negative. As one of the several studies of peripheral blood was thought to be positive for "L. E. cells," cortisone was used in daily doses of 200 to 400 mg. for eight days without benefit. During the last month of the patient's illness, changing systolic murmurs appeared and splinter hemorrhages were noted beneath the nails. These findings suggested subacute bacterial endocarditis. Thus, penicillin, and later Terramycin were used, without benefit. Death occurred suddenly three and one-half months from the onset of his illness.

At autopsy, fluid was present in all serous cavities in moderate amounts. The lungs contained multiple infarcts which showed various degrees of organization. Antemortem clots of various sizes were present in many branches of the pulmonary arteries. The heart was greatly dilated and weighed 500 Gm. White plaques of endocardial thickening were present in the apices of both ventricles. Within the cavity of the left ventricle an ovoid-shaped organized thrombus, measuring 8 by 4 by 3 cm. was firmly attached near the apex.

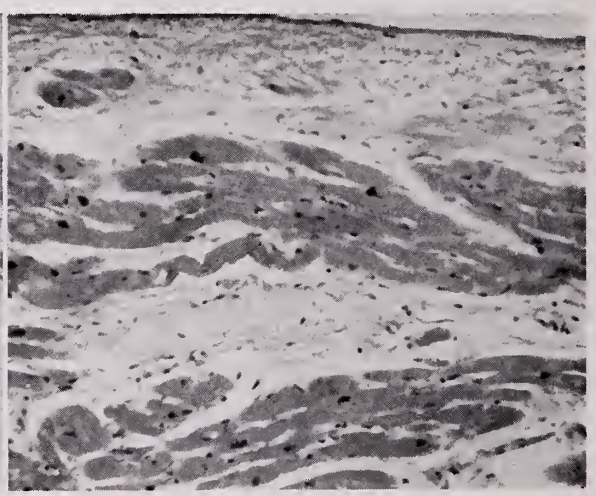

FIG. 1. Left. Photomicrograph showing thickened endocardium overlying the papillary muscle.

Right. Photomicrograph showing the extension of fibrosis into the subendocardial myocardium.

Smaller organized thrombi were attached at the apex of the right ventricle and in the right auricular appendage. Grossly, the valves and coronary vessels appeared normal. Both kidneys contained recent and healed infarcts.

Microscopically, the thickened endocardium and focal areas of fibrosis in the subjacent myocardium were striking. Mild scattered round cell infiltration was present. The coronary vessels showed minimum eccentric intimal thickening.

CASE 2 (Courtesy of Col. T. S. Mattingly, U.S.A.).—A 38 year old white man was admitted to the hospital June 14, 1949, with a chief complaint of shortness of breath and swelling of the ankles of three weeks' duration.

In 1945, because of pain in the region of the umbilicus, an appendectomy was attempted, but when the abdomen was opened, heart and respirations ceased. The patient was revived and the abdomen closed; the appendix was not removed at this time. In 1948, he was admitted to the hospital twice because of abdominal pain. In one instance a perforated duodenal ulcer was suspected, but a cardiologist was called when a fast heart rate was noted. Supraventricular tachycardia was confirmed by electrocardiogram, and an acutely distended liver subsided after treatment.

Following the last-mentioned episode, which occurred in November, 1948, the patient remained asymptomatic until three weeks before his admission in June, 1949. For one week he had suffered attacks of nocturnal dyspnea.

Physical examination revealed a well developed white man with dusky cyanosis of lips and extremities. The temperature was normal; the pulse rate was 116 per minute and the rhythm was regular. The point of maximal impulse was in the anterior axillary line in the sixth interspace. There was 3 plus edema of the lower legs.

A complete blood count and sedimentation rate were normal.

Roentgenograms of the chest revealed an enlarged heart without characteristic contour.

An electrocardiogram showed sinus tachycardia, left axis deviation, and abnormal P waves.

The patient was placed in an oxygen tent as he was cyanotic, and was rapidly digitalized. On the morning of the third day the pulse rate was recorded by the nurse as 82 per minute. Shortly thereafter he suddenly became cyanotic and expired.

Autopsy revealed 1,500 cc. of clear fluid in the right pleural cavity and 500 cc. in the left pleural cavity. The heart weighed 675 Gm. Both ventricles were dilated. The endocardium was moderately to markedly thickened, and organized thrombi were firmly attached to the apex of the left ventricle. The valves were normal. The coronary arteries were not unusual. Other findings included passive congestion of liver and lungs, and a recent infarct of the spleen.

Microscopic examination revealed endocardial sclerosis, focal fibrosis of subjacent myocardium, and scattered round cell infiltration.

DISCUSSION

Thickening of the endocardium received scant attention until the report of Bedford and Konstam[1] in 1946. They described cardiac dilatation, fibrous thickening of the endocardium, and focal fibrosis in the subjacent myocardium as the only significant finding in 40 young West African soldiers dying of congestive heart failure. Two years later, Davies[3] reported similar findings in East African natives and called the condition endocardial fibrosis. Ian Gray[4] in London in

1951, reporting the condition in Europeans, pointed out that whereas cases in Africa might be due to some obscure infestation or infection, the same gross pathologic picture had been described in the medical literature under a variety of titles. These included "cardiac hypertrophy of unknown etiology," "chronic fibroplastic myocarditis," "thromboendocarditis," and others. He referred specifically to cases reported by Levy and Rousselot,[6] Reisinger and Blumenthal,[10] Löffler,[7] and Ware and Chapman.[11] Recently similar cases have been reported by MacMahan, McNicol, Benenson, and Winship,[9] and one from the records of Massachusetts General Hospital.[8]

In cases of endocardial sclerosis, gross specimens show hearts that are noticeably dilated. Actual hypertrophy not so apparent upon inspection is evidenced by weights of 500 and 600 Gm. Sclerosis of the endocardium may occur in white plaques of irregular shape, or it may be diffuse. It is usually most evident near the apices of the ventricles. The entire parietal endocardium may be involved. Organized mural thrombi occur most frequently near the apices of the ventricles, where they extend into the bays between papillary muscles to attach themselves firmly; they may become so large they diminish ventricular filling. Other thrombi may be found in the auricles or their appendages. Cut surfaces of ventricular walls may or may not show subendocardial areas of focal fibrosis. The heart valves, coronary vessels, and pericardium appear normal.

Microscopically, the endocardium is many times its usual one-cell thickness. The subjacent myocardium may show focal areas of fibrosis, or these areas may be elsewhere in the myocardium. They do not have a significant relationship to blood vessels, and they do not occur in all cases. There may be some increase in interstitial stroma. In some areas individual myocardial fibers may be separated, some may be hypertrophied, and some seemingly have undergone pressure atrophy. This pathologic picture has been given the name "serous myocarditis." Small vessels in the subendocardium may contain thrombi. A scattering of round cells may be observed, but careful search fails to reveal focal cellular infiltration as seen in isolated myocarditis.

There are various theories concerning the etiology of endocardial sclerosis: (1) that it results from a dietary deficiency, (2) that it is residual of isolated myocarditis, or (3) that it is a primary chronic parietal endocarditis. Bedford and Konstam, in their original report, suspected a dietary deficiency but found that their patients did not respond to large doses of thiamine chloride. Ian Gray thought that this report excluded a vitamin deficiency as an etiologic factor since heart failure due to thiamine deficiency usually responds promptly to treatment; furthermore, it is the only vitamin deficiency known to produce heart failure. He pointed out that Chagas' disease, or South American trypanosomiasis, produces sclerosis of the endocardium, which supports the opinion that other infections or infestations might likewise produce it. Dammin[2] has reported fibrous thickening of the endocardium, focal fibrosis of myocardium, and active focal myocarditis in the same specimen. One explanation for the cause of endocardial thickening in association with focal myocarditis is that focal myocarditis interferes with blood supply. Finally, the hypothesis that endocardial sclerosis is a primary condition affecting the endocardium does not explain focal fibrosis and other changes in the myocardium. Although Gross[5] explained focal fibrosis as being caused by occlusion of thebesian, arterioluminal, and arteriosinusoidal channels, Wiggers has not found these to be functional in the presence of normal hemodynamics.

SUMMARY

Sclerosis of the mural endocardium may be the only abnormal anatomic finding, other than cardiac hypertrophy, in certain young adults dying of congestive heart failure.

Two such cases are presented.

Clinical features, pathology, and theories as to the etiology of the condition are discussed.

ABSTRACT OF DISCUSSION

DR. GEORGE R. HERRMANN, Galveston: I have seen the hearts of 3 infants with endocardial fibroelastosis, 2 of which were reported by Dr. C. Ralph Letteer of San Antonio in the March, 1953, *Annals of Internal Medicine*. These cases

were recognized from the clinical data by Dr. Louis Manhoff. The other juvenile was not recognized in Galveston but went to postmortem with the diagnosis of congestive heart failure and cardiac enlargement of unknown origin.

I saw 1 adult case in an officer at Brooke Army Medical Center in San Antonio. The officer had returned from Korea and was doing special work at Fort Leavenworth when symptoms of heart failure suddenly began and progressed rapidly. He was transferred to Fort Sam Houston for care, diagnosis, and treatment. He had many of the symptoms which Dr. Howell has outlined, and most of the suggested erroneous diagnoses were made. I thought that he had a hypoplastic aorta, but particularly a hypoplastic coronary artery system. Col. R. B. Johnson agreed, but Col. Carl J. Lind, the pathologist, returned the diagnosis of endocardial fibroelastosis; however, he has not yet made his final report.

Dr. Howell has covered adequately this unusual and probably frequently overlooked condition; I would only add coronary hypoplasia among the theories as to the etiology of endocardial fibroelastosis. We probably make the common error of misdiagnosing some of these cases in which no cause has been apparent as chronic and diffuse coronary artery heart disease, which seems to explain the picture. On several occasions in clinical pictures of this type I have found evidence of a narrow great arch and made the diagnosis of hypoplastic aorta and coronary artery system. I was made aware of this syndrome of hypoplasia of the aorta by one of my oldest students, G. Werley, who died in El Paso recently. He sent me a patient with the diagnosis of hypoplastic aorta twenty years ago. The diagnosis was confirmed by Mavis Kelsey, then a member of the Department of Pathology at the University of Texas Medical Branch, who made a careful study of the case. He also studied the caliber of the aortas and recorded that the hypoplastic aorta and hypoplastic coronary arteries may have given off at right angles extremely hypoplastic muscular branches. The gradient of blood pressure drops off sharply in such arterial systems. This results in decreased blood flow in the transmural branches that run off at right angles from the epicardium almost to the endocardium. This could easily account for the endocardial ischemia and injury and later fibrosis.

The electrocardiograms are suggestively characteristic, I believe, in most of the cases (as I pointed out to Dr. Letteer in his first case and noted in Dr. Howell's first case before digitalization), a depression of the ST segments and negative T waves in leads I, II, III, V_4, V_5, and V_6 indicating an injury and ischemia in the subendocardial tissue. I have always insisted upon a description of the RST changes rather than using the term ventricular strain, which term should be abandoned. Certainly in these instances the blood pressure is low and one cannot visualize physical strain. It is much more logical to visualize a subendocardial ischemia and injury from coronary insufficiency or even digitalization.

Subendocardial fibroelastosis may not be far removed from sclerodermatous heart disease. Dr. Howell has dealt with the collagen disease etiology as a possibility. I have seen the hearts of patients with Chagas' disease at the Oswaldo Cruz Institute in Rio de Janiero and noted that the myocardial process is much more diffuse. Triatoms infected with Trypanosoma cruzi are found in Texas; we should have Chagas' disease myocarditis in Texas, but we have not recognized it.

ACUTE HEMOLYTIC ANEMIA

Report of 3 Cases in One Family

J. LEIGHTON GREEN, M.D., El Paso, Texas

FAMILIAL hemolytic anemia, also known as spherocytic anemia, chronic hemolytic jaundice, or acholuric jaundice, is a disease characterized by chronic or recurring anemia associated with hemolytic crises, increase in fragility of the erythrocytes, a tendency for the red cells to be spherical and microcytic, high reticulocyte count, increased excretion of urobilin in the urine, splenomegaly, and usually icterus. Doan said that "true hemolytic icterus is always the manifestation of an inherited constitutional defect." However, there is also a so-called acquired type, which most often manifests itself later in life than the congenital form. The acquired form is usually the more severe.

Hemolytic anemia seldom becomes apparent in infancy, but is usually detected before adolescence. Pallor and slight jaundice may be the first signs, together with a mild anemia. Usually the spleen is enlarged. First indication of the disease may be a crisis.

Hemolytic crises may be mild or they may be fatal. A crisis may be precipitated by trivial illness, emotional stress, or fatigue. Crises occur at varying intervals, with fever, abdominal pain, pallor, jaundice, and weakness. During a crisis there is excessive destruction of red blood cells, as shown by a lower red cell count, rising icteric index, and increased urobilin in the stools and urine. The urine is highly colored. The stools appear normal in color and consistency, but contain much urobilin. There is always a high reticulocyte count, perhaps to 95 per cent. Fragility of red blood cells to hypotonic sodium chloride solution is noticeably increased, as a rule. The white cell count is not characteristic but most frequently shows a leukocytosis, with increase of polymorphonuclear leukocytes. It has been shown that hepatic function is diminished during a crisis, a form of hepatitis being present. Cholecystitis is commonly found associated with the anemia, and cholelithiasis is frequent, even in the very young.

Splenectomy is curative. It usually relieves all symptoms; however, the increased fragility of red blood cells may persist long after the operation. It is best

not to perform the operation during an acute crisis, but when the crisis is unduly prolonged, surgery may be indicated. Transfusions may be harmful during a crisis but are often necessary as a preoperative measure when the blood count is extremely low.

This report concerns a family in which hemolytic anemia has appeared in three successive generations. I have performed splenectomy on three members of the family. One grandfather is said to have died of anemia, without benefit of surgery. His daughter (case 2) was relieved by splenectomy. Two of her sisters have had splenectomy, and 2 of her 3 daughters also have undergone splenectomy (cases 1 and 3). The grandfather had 3 sons, brothers of the patient in case 2. The second of these brothers has a son, aged 6 years, who is soon to have surgery for anemia, and another son, aged 1, who has anemia.

CASE REPORTS

CASE 1.—R. M. B., aged 12 years, entered Providence Hospital on June 20, 1950. Her mother said that the child had always had trouble from "spleen disease." She had been chubby until the age of 7. For the past five years she had been sick most of the time. Attacks of abdominal pain had occurred at intervals. One doctor had given a poor prognosis because of heart disease. The patient had been under treatment in Mexico, where several blood transfusions had been given. Approximately four days before she entered the hospital, jaundice had been noticed. At about the same time, she began to complain of abdominal pain and to vomit.

Examination revealed a thin, acutely ill Mexican girl. She was deeply jaundiced and dehydrated, with temperature of 100 F., pulse of 120 per minute, and respiration of 22 per minute. All mucous membranes, sclerae, and skin showed deep jaundice. The skin was excessively dry. A loud to-and-fro murmur was heard at the apex of the heart. Blood pressure was 120/72. The spleen was markedly enlarged, extending to the level of the umbilicus, and was firm. There was generalized abdominal tenderness of moderate degree. Blood count on June 20 showed red blood cells 2,700,000 per cubic millimeter, hemoglobin 7.25 Gm. per 100 cc. (50 per cent), white blood cells 7,700 with polymorphonuclear leukocytes 79 per cent, stabs 4 per cent, lymphocytes 20 per cent, and large monocytes 1 per cent. A fragility test showed hemolysis beginning at .50 per cent sodium chloride and complete at .35 (control: beginning at .40 per cent, complete at .34). The conclusion was increased fragility of erythrocytes. The hematocrit level was 26 cc. per 100 cc. of blood. The sedimentation rate was 35 mm. per hour. Kahn and Eagle tests were negative. The urine was cherry red, slightly turbid, acid, with specific gravity of 1.015, no albumin or sugar, 24 to 32 pus cells per high power field, a few squamous epithelial cells, and much bile. On June 23, coagulation time was 5 minutes, bleeding time 1.75 minutes, and icteric index 114. A cephalin flocculation test was negative.

The diagnosis was familial hemolytic jaundice, with splenomegaly. A consulting pediatrician diagnosed rheumatic mitral valve disease without decompensation. On June 21, 300 cc. of citrated blood was given as a transfusion; on June 23, another 300 cc. Following the second transfusion there was a mild reaction, with urticaria and some edema of the eyelids.

By June 24 the blood count had improved: red blood cells 3,680,000, hemoglobin 10.5 Gm. (72.4 per cent), white blood cells 5,550, polymorphonuclear leukocytes 55 per cent, stabs 2 per cent, lymphocytes 34 per cent, large monocytes 1 per cent, and eosinophils 4 per cent. Prothrombin was 100 per cent of normal.

On June 26, splenectomy was done, through a left transverse incision. The spleen weighed 610 Gm. and measured 26 cm. in the greatest diameter. There were no abnormal adhesions about the spleen. Palpation of the gallbladder and bile ducts detected no stones. During the operation, a transfusion of 500 cc. of citrated blood was given. Convalescence was uneventful. Temperature, which had receded to normal before operation, rose to 101 F. for two days postoperatively, then remained normal. Preoperatively, this patient received vitamin K with caroid and bile salts. Postoperatively, vitamin C and protein hydrolysate were administered. On June 28 another transfusion of 300 cc. of citrated blood was given. The blood count on June 30 was red blood cells 4,900,000, hemoglobin 13.7 Gm. (94.8 per cent), and white blood cells 8,150. The wound healed by first intention. Jaundice cleared up. The patient left the hospital July 4, the eighth postoperative day.

Repeated blood counts over a period of sixteen months showed the red cell count and hemoglobin within normal limits. A recent report from Mexico tells that the patient is having serious heart trouble.

CASE 2.—Mrs. J. B., aged 31, mother of the patient in case 1, was admitted to Providence Hospital January 30, 1951, for a blood transfusion. In July, 1947, I had performed a laparotomy on this woman for ruptured tubal pregnancy. Her blood count had remained low. She had been delivered of a normal child in June, 1948 (case 3). The patient gave a history of having been jaundiced at times. A cholecystogram had revealed no calculi, though the gallbladder did not fill. It was noted in the history that 2 of the patient's sisters had undergone splenectomy.

On the patient's admission to the hospital the blood count was red blood cells 3,300,000, hemoglobin 10 Gm. (62.5 per cent), white blood cells 9,500, polymorphonuclear leukocytes 67 per cent, lymphocytes 30 per cent, and large monocytes 3 per cent. Marked anisocytosis and slight poikilocytosis of red blood cells were observed. A transfusion of 500 cc. of citrated blood was given, and the patient went home the same day. Subsequent blood counts showed progressive anemia: February 6—red blood cells 3,100,000, hemoglobin 55 per cent; February 21—red blood cells 2,640,000, hemoglobin 55 per cent.

On March 6 the patient was readmitted to Providence Hospital with a diagnosis of familial anemia. She was not acutely ill, but felt tired and weak and complained of dizziness. The spleen was palpable, moderately enlarged, and tender. The blood count March 6 showed red blood cells 3,200,000, hemoglobin 10 Gm. (62.5 per cent), white blood cells 7,000, polymorphonuclear leukocytes 52 per cent, lymphocytes 37 per cent, monocytes 4 per cent, and eosinophils 7 per cent. Kahn and Eagle tests were negative. A fragility test was inconclusive. A transfusion of 500 cc. of citrated blood was given on the day of admission. Next day, March 7, splenectomy was performed through a left transverse incision. During the operation, transfusion of 1,000 cc. of blood was given. The spleen was approximately twice normal size, weighing 778 Gm. It measured 28 by 18 cm. There were some adhesions between spleen and diaphragm. A small accessory spleen approximately 5 cm. in diameter was found in the gastrosplenic mesentery. It was removed. Palpation revealed calculi in the gallbladder, which was large

and bound with adhesions. No stones could be detected in the common duct.

Convalescence was uneventful, the patient complaining only of some pain in the left anterior cervical region (from diaphragmatic irritation). Her temperature never rose above 100.8 F. She left the hospital on March 13, six days postoperatively. The wound healed by first intention.

Subsequent blood counts showed some anemia persisting: March 19—red blood cells 3,830,000, hemoglobin 65 per cent, white blood cells 11,400; September 6—red blood cells 3,430,000, hemoglobin 78 per cent, white blood cells 8,500. However, the patient gained weight and felt well. On May 3, 1952, she was delivered of an apparently normal boy. The record shows that at that time the red blood cell count was 5,200,000, with hemoglobin of 17.5 Gm. (103 per cent), and white blood cell count of 10,900. A differential count showed polymorphonuclear leukocytes 79 per cent, stabs 8 per cent, lymphocytes 16 per cent, monocytes 3 per cent, and eosinophils 2 per cent. Urinalysis was normal, and an Eagle test negative.

This patient has refused operation for gallstones, which are apparently asymptomatic.

CASE 3.—P. B., aged 4 years, is the daughter of the patient in case 2 and the sister of the patient in case 1. She was admitted to Providence Memorial Hospital March 8, 1953, acutely ill, with abdominal pain, vomiting, chills, and fever. The mother said that the illness began suddenly March 6 with vomiting. The temperature rose abruptly to 105 F. The patient complained of abdominal pain and vomited frequently. There was a slight diarrhea. The mother noticed that the urine was brick red. Only previous illness had been attacks of tonsillitis, which always responded promptly to an injection of penicillin. The mother had noticed that the child's urine was brick red on one previous occasion, at the age of 3 years.

Examination on admission revealed a very sick child, flushed, with hot, dry skin, pulse of 140, respiratory rate of 22. The temperature spiked to 105 or 106 F. daily, fell to normal or subnormal every day (as low as 95.6 F. one day). Chills were frequent. Stools were frequent, dark, and malodorous. The abdomen was slightly distended, somewhat tympanitic. It presented slight generalized tenderness, not localized. Auscultation suggested increased peristalsis. The liver extended 2 fingerbreadths below the right costal margin. The spleen could not be palpated.

Since the diagnosis was obscure, a large amount of laboratory work was done: A blood count on March 8 showed red blood cells 3,200,000, hemoglobin 9 Gm. (53.9 per cent), white blood cells 8,900, polymorphonuclear leukocytes 72 per cent, segmented cells 68 per cent, lymphocytes 27 per cent, and monocytes 1 per cent. Marked anisocytosis was found. Two normoblasts were present among 100 cells. On March 9 a fragility test showed hemolysis beginning at .48 per cent sodium chloride and complete at .34 per cent sodium chloride. A Coombs' test was negative. March 10 the blood count was red blood cells 3,400,000 (following a transfusion of 300 cc. of blood March 9), hemoglobin 11.0 Gm. (64.7 per cent), white blood cells 9,050, polymorphonuclear leukocytes 77 per cent, segmented cells 57 per cent, lymphocytes 22 per cent, and monocytes 1 per cent. Smears showed no malaria parasites.

March 11, agglutination tests were negative for typhoid, paratyphoid, Brucella abortus, Brucella melitensis, and Proteus X19. March 12 the serum albumin-globulin ratio was reported as 1.7:1.0. On the same day stool examination revealed no parasites or ova, and no blood. Later a stool culture was negative. Blood chlorides were 105.4 milliequivalents per liter with sodium chloride 154.8 milliequivalents and potassium chloride 3.8 milliequivalents. Blood culture was negative March 13 and again April 9.

The fever did not respond to antibiotics or other therapy. Supportive treatment was given, and advisability of surgery during the crisis was debated. The diagnosis of hemolytic anemia was established.

March 16 the blood count was slightly improved: red blood cells 3,500,000, hemoglobin 10 Gm. (58.8 per cent), white blood cells 6,200, polymorphonuclear leukocytes 53 per cent, segmented cells 50 per cent, lymphocytes 42 per cent, and monocytes 3 per cent.

On March 18, for no accountable reason, the temperature fell to normal, and it remained down. The patient felt well, was up and about the ward, and ate well.

On March 24, under ether anesthesia, splenectomy was done through a left transverse incision. Before the abdominal incision was made, a polyethylene tube was inserted into a vein of the right arm. This facilitated giving fluids for several days. The spleen was found to be approximately twice normal size, somewhat lobulated at its lower border. Before the splenic pedicle was clamped, Adrenalin Chloride was given hypodermically, causing contraction of the spleen. Only a few adhesions were present, about the lower pole of the spleen and about the diaphragm. As soon as the splenic pedicle had been clamped, blood transfusion was started. The pathologist reported dilated and empty sinusoids in the spleen, the picture of hemolytic anemia. The spleen weighed 79.5 Gm.

Postoperative convalescence was smooth. On the first postoperative day, temperature rose to 102.4 F. Then it quickly receded to normal, remaining normal after the third day. The patient was sent home one week after operation, on March 31. The wound had healed by this time. The patient gained weight and has remained well since. On May 28, 1953, the red blood cell count was 4,520,000, hemoglobin 15 Gm. (88.2 per cent), and white blood cell count 4,000 with polymorphonuclear leukocytes 62 per cent, stabs 2 per cent, lymphocytes 30 per cent, and eosinophils 8 per cent. The hematologist also observed occasional nucleated erythrocytes and cells showing Howell-Jolly bodies.

SUMMARY

Familial hemolytic anemia is congenital in most cases, may appear in children or adults, and has characteristic blood findings. Crises may be severe. Operation should be deferred until a remission occurs, if possible. Splenectomy cures these patients.

Three cases are presented, all in the same family, all cured by splenectomy. Family history is reviewed, with evidence of the disease in 8 members of one family.

American Association for Thoracic Surgery, Montreal, Canada, May 3-5, 1954. Dr. Emile F. Holman, San Francisco, Pres.; Dr. Paul C. Samson, 2938 McClure St., Oakland 9, Calif., Secy.

American Association of Genito-Urinary Surgeons, Shawnee-on Delaware, Pa., May 26-28, 1954. Dr. Vincent J. O'Conor, Chicago, Pres.; Dr. Norris J. Heckel, 122 S. Michigan Ave., Chicago 3, Secy.

American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Hot Springs, Va., Sept. 9-11, 1954. Dr. Herbert F. Schmitz, Chicago, Pres.; Dr. F. R. Lock, Bowman Gray School, Winston-Salem, N. C., Secy.

American Cancer Society. Dr. Guy Aud, Louisville, Ky., Pres.; Mr. M. R. Runyon, 47 Beaver St., New York, Executive Vice-Pres.

American College of Allergists, Miami Beach, April 5-10, 1954. Dr. M. Murray Peshkin, New York, Pres.; Dr. Fred W. Wittich, 423 La Salle Medical Bldg., Minneapolis 2, Secy.

American College of Chest Physicians, San Francisco, June 17-20, 1954. Dr. Alvis E. Greer, Houston, Pres.; Mr. Murray Kornfeld, 112 E. Chestnut St., Chicago 11, Executive Secy.

American College of Physicians, Chicago, April 5-9, 1954. Dr. Leroy H. Sloan, Chicago, Pres.; Mr. E. R. Loveland, 4200 Pine St., Philadelphia 4, Secy.

American College of Radiology, Chicago, Feb. 5, 1954. Dr. John D. Camp, Los Angeles, Pres.; Mr. W. C. Stronach, 20 N. Wacker Drive, Chicago 6, Executive Secy.

American College of Surgeons, Atlantic City, N. J., Nov. 14-18, 1954. Dr. Fred W. Rankin, Lexington, Ky., Pres.; Dr. Michael L. Mason, 40 E. Erie St., Chicago 11, Secy.

American Congress of Physical Medicine and Rehabilitation, Washington, D. C., Sept. 6-11, 1954. Dr. William B. Snow, New York, Pres.; Dr. Frances Baker, 1 Tilton Ave., San Mateo, Calif., Secy.

American Dermatological Association, White Sulphur Springs, W. Va., April 13-17, 1954. Dr. Louis A. Brunsting, Rochester, Minn., Pres.; Dr. J. Lamar Callaway, Duke Hospital, Durham, N. C., Secy.

American Gastro-Enterological Association, San Francisco, June 18-19, 1954. Dr. J. M. Ruffin, Durham, N. C., Pres.; Dr. H. Marvin Pollard, 1313 E. Ann St., Ann Arbor, Mich., Secy.

American Gynecological Society, Hot Springs, Va., May 20-22, 1954. Dr. Richard W. TeLinde, Baltimore, Pres.; Dr. John I. Brewer, 104 S. Michigan Ave., Chicago, Secy.

American Heart Association, Chicago, April 1-4, 1954. Dr. Robert L. King, Seattle, Pres.; Dr. William H. Bunn, 44 E. 23d St., New York 10, Secy.

American Hospital Association. Dr. Edwin L. Crosby, Chicago, Pres.; Mr. George P. Bugbee, 18 E. Division St., Chicago, Executive Secy.

American Laryngological, Rhinological, and Otological Society, Boston, May 25-27, 1954. Dr. LeRoy A. Schall, Boston, Pres.; Dr. C. S. Nash, 277 Alexander St., Rochester 7, N. Y., Secy.

American Neurological Association, Atlantic City, N. J., June 14-16, 1954. Dr. Roland P. Mackay, Chicago, Pres.; Dr. H. Houston Merritt, 710 W. 168th St., New York 32, Secy.

American Ophthalmological Society, Glacier Park, Mont., June 16-18, 1954. Dr. William L. Benedict, Rochester, Minn., Pres.; Dr. M. C. Wheeler, 30 W. 59th St., New York 19, Secy.

American Orthopedic Association, Bretton Woods, N. H., June 6-9, 1954. Dr. A. R. Shands, Jr., Wilmington, Del., Pres.; Dr. George O. Eaton, 4 E. Madison St., Baltimore 2, Secy.

American Pediatric Society, Buck Hill Falls, Pa., May 3-5, 1954. Dr. Rustin McIntosh, New York, Pres.; Dr. Aims McGuinness, 237 Medical Laboratory, University of Pennsylvania, Philadelphia 46, Secy.

American Proctologic Society, Los Angeles, June 2-5, 1954. Dr. Wendell Green, Toledo, Ohio, Pres.; Dr. Stuart T. Ross, 131 Fulton Ave., Hempstead, N. Y., Secy.

American Psychiatric Association, St. Louis, May 3-7, 1954. Dr. Kenneth E. Appel, Philadelphia, Pres.; Dr. R. Finley Gayle, 6300 Three Chopt Rd., Richmond 21, Va., Secy.

American Public Health Association, Buffalo, N. Y., Oct. 11-15, 1954. Dr. Wilton L. Halverson, San Francisco, Pres.; Dr. R. W. Atwater, 1790 Broadway, New York 19, Executive Secy.

American Society of Anesthesiologists. Dr. Ralph T. Knight, Minneapolis, Pres.; Dr. J. E. Remlinger, Jr., 188 W. Randolph St., Chicago, Secy.

American Society of Clinical Pathologists, Washington, D. C., Sept. 6, 1954. Dr. John R. Schencken, Omaha, Pres.; Dr. Clyde G. Culbertson, Indiana University School of Medicine, Indianapolis, Secy.

American Surgical Association, Cleveland, April, 1954. Dr. Howard C. Naffziger, San Francisco, Pres.; Dr. R. Kennedy Gilchrist, 59 East Madison St., Chicago 3, Secy.

American Urological Association, New York, May 31-June 3, 1954. Dr. J. A. Campbell Colston, Baltimore, Md., Pres.; Dr. C. H. deT. Shivers, 121 S. Illinois Ave., Atlantic City, N. J., Secy.

Association of American Physicians and Surgeons, Jackson, Miss., April 1-3, 1954. Dr. Thomas G. Goldsmith, Greenville, S. C., Pres.; Mr. Harry E. Northam, 360 N. Michigan Ave., Chicago 1, Executive Secy.

International College of Surgeons, U. S. Chapter, Chicago, Sept. 7-10, 1954. Dr. William R. Lovelace, Albuquerque, N. M., Pres.; Dr. Karl Meyer, 1516 Lake Shore Drive, Chicago, Secy.

National Tuberculosis Association, Atlantic City, N. J., May 17-21, 1954. Mr. Mark H. Harrington, Denver, Pres.; Mr. Kemp D. Battle, 1790 Broadway, New York 19, Secy.

Radiological Society of North America. Dr. Ira H. Lockwood, Kansas City, Mo., Pres.; Dr. D. S. Childs, 713 E. Genesee, Syracuse 2, N. Y., Secy.

Southern Medical Association, St. Louis, 1954. Dr. Alphonse McMahon, St. Louis, Pres.; Mr. C. P. Loranz, 1020 Empire Bldg., Birmingham 3, Ala., Secy.

Southern Psychiatric Association, Louisville, October, 1954. Dr. John D. Trawick, Louisville, Ky., Pres.; Dr. Joseph L. Knapp, 210 N. Westmoreland, Dallas, Secy.

Southern Surgical Association. Dr. I. A. Bigger, Richmond, Va., Pres.; Dr. John C. Burch, 2112 West End Ave., Nashville 5, Tenn., Secy.

Southwest Allergy Forum, New Orleans, May 9-11, 1954. Dr. Henry D. Ogden, New Orleans, Pres.; Dr. Stanley Cohen, 1441 Delachaise St., New Orleans, Secy.

Southwest Regional Cancer Conference. Secy., 209 Medical Arts Bldg., Fort Worth.

Southwestern Medical Association, El Paso, 1954. Dr. Willard W. Schuessler, El Paso, Pres.; Dr. Celso Stapp, 800 Montana, El Paso, Secy.

Southwestern Surgical Congress, Oklahoma City, Sept. 27-29, 1954. Dr. Philip B. Price, Salt Lake City, Pres.; Dr. C. R. Rountree, 1227 Classen, Oklahoma City 3, Secy.

Tri-State Medical Assembly, Fall, 1954. Dr. Joe D. Nichols, Atlanta, Pres.; Dr. Broox C. Garrett, 940 Margaret Pl., Shreveport, La., Secy.

United States-Mexico Border Public Health Association, Albuquerque, N. M., April, 1954. Mr. Richard F. Poston, Dallas, Pres.; Dr. Sidney B. Clark, 314 U. S. Court House, El Paso, Secy.

STATE

Private Clinics and Hospitals Association of Texas. Dr. W. R. Swanson, Taylor, Pres.; Dr. John Dupree, Levelland, Secy.

Texas Academy of General Practice, Galveston, Sept. 9-11, 1954. Dr. C. Forrest Jorns, Houston, Pres.; Dr. Woodson W. Harris, 1410 Nickerson, Austin, Secy.

Texas Academy of Internal Medicine. Dr. Martin S. Buehler, Dallas, Pres.; Dr. George M. Jones, 1314 Medical Arts Bldg., Dallas, Secy. Meetings restricted to members.

Texas Air-Medics Association, San Antonio, May 2-3, 1954. Dr. George L. Gallaher, Harlingen, Pres.; Dr. J. S. Minnett, 2512 Welborn, Dallas, Secy.

Texas Association of Blood Banks, Abilene, Dec. 3-4, 1954. Dr. C. T. Ashworth, Fort Worth, Pres.; Miss Marjorie Saunders, 3500 Gaston Ave., Dallas, Secy.

Texas Association of Obstetricians and Gynecologists, Waco, Feb. 19-20, 1954. Dr. D. D. Wall, San Angelo, Pres.; Dr. Carey Hiett, 815 Fifth Ave., Fort Worth, Secy.

Texas Chapter, American College of Chest Physicians, San Antonio, May 2, 1954. Dr. Henry H. Hoskins, San Antonio, Pres.; Dr. Walter C. Brown, 1733 S. Brownlee Blvd., Corpus Christi, Secy.

Texas Club of Internists. Dr. Joseph F. McVeigh, Fort Worth, Pres.; Dr. Charles Darnall, Capital National Bank Bldg., Austin, Secy.

Texas Dermatological Society, San Antonio, May 2, 1954. Dr. Maurice Barnes, Waco, Pres.; Dr. Thomas L. Shields, 1216 Pennsylvania Ave., Fort Worth, Secy.

Texas Diabetes Association, San Antonio, May 2, 1954. Dr. Raymond L. Gregory, Galveston, Pres.; Dr. Edmond K. Doak, 501 Hermann Professional Bldg., Houston, Secy.

Texas Division, American Cancer Society, Austin, Jan. 14-15, 1954. Mr. Travis Wallace, Dallas, Pres.; Mr. J. Louis Neff, 1609 Colorado, Austin, Executive Director.

Texas Heart Association, San Antonio, May 3, 1954. Dr. Joseph McVeigh, Fort Worth, Pres.; Miss Roberta Miller, 412 Fidelity Union Life Bldg., 1511 Bryan St., Dallas, Executive Secy.

Texas Hospital Association, Houston, May 18-20, 1954. Mr. W. U. Paul, El Paso, Pres.; Mrs. Ruth Barnhart, 2210 Main St., Dallas, Secy.

Texas Neuropsychiatric Association, San Antonio, May 2, 1954. Dr. James Blair, San Antonio, Pres.; Dr. John L. Otto, John Sealy Hospital, Galveston, Secy.

Texas Orthopedic Association, San Antonio, May 3, 1954. Dr. Edward T. Smith, Houston, Pres.; Dr. Margaret Watkins, 3629 Fairmount St., Dallas, Secy.

Texas Pediatric Society, Fort Worth, October, 1954. Dr. Robert L. Moore, Dallas, Pres.; Dr. James N. Walker, 3616 Tulsa Way, Fort Worth, Secy.

Texas Public Health Association, Galveston, Feb. 14-17, 1954. Dr. Roy G. Reed, La Marque, Pres.; Mr. Earle W. Sudderth, Dallas County Health Department, Court House, Dallas, Executive Secy.

Texas Radiological Society, Dallas, Jan. 29-30, 1954. Dr. J. E. Miller, Dallas, Pres.; Dr. R. P. O'Bannon, 650 Fifth Ave., Fort Worth, Secy.

Texas Railway and Traumatic Surgical Association, San Antonio, May 3, 1954. Dr. William E. Crump, Wichita Falls, Pres.; Dr. W. D. Marrs, 306 Broadway, Fort Worth, Secy.

Texas Rheumatism Association. Dr. Alfred H. Harris, Dallas, Pres.; Dr. Charles H. Cornwell, Marlin, Secy.

Texas Society for Mental Health, Waco, March 4-6, 1954. Mrs. Frank Schoonover, Fort Worth, Pres.; Mrs. Elizabeth F. Gardner, 2504 Jarratt Ave., Austin 21, Executive Secy.

Texas Society of Anesthesiologists, San Antonio, May 2, 1954. Dr. James B. Robinett, Jr., Houston, Pres.; Dr. C. R. Allen, John Sealy Hospital, Galveston, Secy.

Texas Society of Gastroenterologists and Proctologists, San Antonio, May 3, 1954. Dr. Cecil O. Patterson, Dallas, Pres.; Dr. W. T. Arnold, 1402 Hermann Prof. Bldg., Houston, Secy.

Texas Society of Ophthalmology and Otolaryngology. Dr. Dan Brannin, Dallas, Pres.; Dr. Lyle Hooker, 627 Esperson Bldg., Houston, Secy.

Texas Society of Pathologists, Galveston, Jan. 31, 1954. Dr. A. O. Severance, San Antonio, Pres.; Dr. Lloyd R. Hershberger, Shannon Memorial Hospital, San Angelo, Secy.

Texas Surgical Society, Waco, April 5-6, 1954. Dr. Dudley Jackson, Sr., San Antonio, Pres.; Dr. Albert W. Hartman, 414 Navarro St., San Antonio 5, Secy.

Texas Tuberculosis Association, Dallas, April 9-10, 1954. Dr. R. G. McCorkle, San Antonio, Pres.; Miss Pansy Nichols, 208 E. Ninth, Austin, Executive Secy.

Texas Urological Society, Fort Worth, Feb. 22, 1954. Dr. J. Reese Blundell, Houston, Pres.; Dr. Dolphus E. Compere, 1415 Pennsylvania Ave., Fort Worth, Secy.

DISTRICT

First District Society, Pecos, Feb. 12, 1954. Dr. John W. O'Donnell, Alpine, Pres.; Dr. H. D. Garrett, First National Bldg., El Paso, Secy.

Second District Society, Sweetwater, April 15, 1954. Dr. T. D. Young, Sweetwater, Pres.; Dr. Francis Hood, Sweetwater, Secy.

Third District Society, Amarillo, April 13, 1954. Dr. Robert A. Neblett, Canyon, Pres.; Dr. James T. Hall, 1626 Fifteenth St., Lubbock, Secy.

Fourth District Society, San Angelo, Fall, 1954. Dr. P. M. Wheelis, Brownwood, Pres.; Dr. James N. White, San Angelo, Secy.

Fifth and Sixth Districts Society, Corpus Christi, July, 1954. Dr. Y. C. Smith, Sr., Corpus Christi, Pres.; Dr. Robert J. Sigler, 1126 Third Street, Corpus Christi, Secy.

Seventh District Society, Austin, Feb. 18, 1954. Dr. Benjamin Clary Bates, Austin, Pres.; Dr. William McLean, 4618 Burnet Road, Austin, Secy.

Eighth District Society. Dr. Howard Z. Fretz, Wharton, Pres.; Dr. George E. Glover, Jr., Victoria, Secy.

Ninth District Society, Brenham, March 25, 1954. Dr. George D. Bruce, Baytown, Pres.; Dr. Lyman C. Blair, 1212 Rothwell, Houston, Secy.

Tenth District Medical Society. Dr. Edmund D. Jones, Beaumont, Pres.; Dr. O. W. Harris, Jr., Liberty, Secy.

Eleventh District Society, Crockett, Spring, 1954. Dr. John Dean, Crockett, Pres.; Dr. Marlin T. Braswell, Henderson, Secy.

Twelfth District Society, Waco, Jan. 12, 1954. Dr. Howard Dudgeon, Jr., Waco, Pres.; Dr. Walter B. King, Jr., Waco, Secy.

Thirteenth District Society, Fort Worth, 1954. Dr. William E. Crump, Wichita Falls, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteenth District Society, Denton, 1954. Dr. J. W. Atchison, Gainesville, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Longview, April 20, 1954. Dr. L. E. Rutledge, Daingerfield, Pres.; Dr. George Tate, Longview, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 15-18, 1954. Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco, April 7, 1954. Dr. Walter B. King, 2320 Columbus Ave., Waco, Secy.

International Medical Assembly of Southwest Texas, San Antonio, Jan. 26-28, 1954. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 8-11, 1954. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference. Dr. C. H. Wilson, Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas, July 19-21, 1954. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, March 31, 1954. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

American Academy of Allergy

Texas physicians are invited to attend the annual meeting of the American Academy of Allergy to be held in Houston on February 1, 2, and 3. No charge will be made for registration, although those who wish to attend the postgraduate courses in clinical allergy, advanced subjects (seminar), and allergenic molds and pollens, scheduled for January 29-31, will pay $40, $15, and $35 respectively.

Specialists from throughout the United States and representatives from several foreign countries will present papers, and scientific and commercial exhibits will be displayed. A program for visiting ladies also is planned.

The Committee on Local Arrangements includes Drs. Homer E. Prince, chairman; Ralph Bowen, DeWitt H. Hotchkiss, Jr., Richard L. Etter, Jack M. Rose, and Warren F. Kahle. The Hostess Committee is headed by Mrs. Homer E. Prince, chairman.

Hotel reservations should be made with the Shamrock Hotel, Houston, and registration for the postgraduate courses with the American Academy of Allergy, 208 E. Wisconsin Avenue, Milwaukee 2. No advance registration is necessary for attending the meeting.

LEGISLATIVE PREVIEW

As the second session of the Eighty-Third Congress gets under way, the Washington office of the American Medical Association has outlined some of the pending legislation of interest to the medical profession.

Social Security.—Awaiting action is the administration's plan to extend social security coverage to more than 10,000,000 additional persons, including physicians. The American Medical Association, as well as other groups of the self-employed, has opposed this type of legislation consistently. Instead, the AMA recommends the passage of a measure to allow self-employed persons to defer income tax payments on a portion of their incomes, placed in restricted pension funds and obtainable in the form of benefits only in case of disability or at the specified retirement age. Such provisions were included in bills first introduced as Reed-Keogh bills and now identified as Jenkins-Keogh because of the sponsors.

Other possible amendments to the social security law involve total and permanent disability payments and waiver of old age and survivor insurance premiums for the disabled so that their final pensions will not be reduced because of periods when they had little or no income. In each of these, medical determinations would be required, threatening an expansion of the federal medical program, placing the physicians in an unreasonable role, or calling for compulsory rehabilitation. The AMA is not opposed to the objective of the proposals but suggests that pension rates be based on the ten best earning years instead of that premiums be waived, thus obviating the need for medical determinations.

It is expected that Congress again will be asked to pass legislation providing free hospitalization under the old age and survivors insurance laws for all persons past the age of 65 years and covered by the insurance.

Military Personnel and Veterans.—In line with the recent action of the Veterans Administration in amending its forms to require more financial information from veterans applying for hospitalization of nonservice connected disabilities, who must state that they cannot afford private care, Congress may want further clarification of the government's obligations to veterans. It is thought that special effort will be made to expand medical benefits to veterans by such methods as increasing the periods in which certain diseases may be presumed to be of service origin. The position of the American Medical Association with respect to medical care of veterans has been declared as (1) for the best possible care by the Veterans Administration of all veterans with service connected conditions, (2) for Veterans Administration care of long-term tuberculous and neurologic patients if the veterans cannot pay for it themselves and until local and state facilities are adequate, and (3) against Veterans Administration care of all other cases of nonservice connected conditions, these being the responsibility of the veteran, his family, or his community.

Efforts to implement the Moulton Commission's recommendations for broadening the medical care program for military dependents has been promised by the Defense Department. The commission favors caring for as many dependents as possible at military installations, with others receiving private care primarily at the expense of the federal government. The American Medical Association in December proposed that in the United States military personnel and facilities be used for dependents only if private facilities are inadequate.

Another measure which the Defense Department is recommending would provide government scholarships for medical, dental, and nursing study with the recipients obligated for government service at the rate of one year for every year of the scholarship. The AMA House of Delegates referred to the Board of Trustees the problem of whether or not such legislation should be endorsed.

Health Insurance.—Bills probably will be offered to provide government subsidy of private health insurance plans.

Bricker Amendment.—Holding over from the previous session is the Bricker resolution to check the treaty-making powers of the President. The AMA has endorsed such a measure.

Relationship of Governments. — Two commissions appointed last year, one headed by Clarence Manion and the other by former President Herbert Hoover, are studying the relationships between the federal government on one hand and state and local governments on the other and also the operations of the executive branch of the federal government. The Manion Commission is supposed to have a report ready by March but may ask for more time; the Hoover Commission has until next year to report.

HEALTH INSURANCE INCREASE

Accident and health coverage in the United States increased to a new record high level in 1952, according to the Health Insurance Council's annual survey released in September, 1953.

In Texas, 3,800,000 persons were protected against the expense of hospitalization at the end of 1952, 3,697,000 against surgical expenses, and 1,743,000 against medical expense.

More than $2 billions cash benefits were received in 1952 in the nation, with about half this amount to cover the cost of hospitalization. The total number of persons with hospitalization insurance increased 7 per cent over 1951. There was a 12 per cent increase in the number of persons protected against the cost of operations under surgical expense coverage, and the number of those protected against doctors' bills under medical expense coverage shows an increase of 29 per cent over 1951.

The council stated that at the close of 1952 more than 38 million persons were protected against the loss of income due to disability, and nearly 700,000 had major medical expense coverage, the newest form of voluntary health protection designed to help meet the costs of very serious illness.

Organizations covered in the council report include insurance companies, Blue Cross, Blue Shield, and various other independent plans sponsored by business and industry, employee benefit associations, and private group clinics.

COX RESIGNS AS STATE HEALTH OFFICER

Dr. George W. Cox, State Health Officer of Texas for the past seventeen years, offered his resignation, effective March 1, when the State Board of Health met in Austin on December 14. The board accepted his resignation with the request that he remain in office until a successor can be selected and pointed out that during his term the services of the State Department of Health have been extended to "every county and municipality in Texas with a degree of efficiency equal to the best public health services in the nation."

AMERICAN GERIATRICS SOCIETY

The American Geriatrics Society will meet June 17-19 in San Francisco, immediately preceding the meeting of the American Medical Association. Physicians and other scientists interested in geriatrics may attend. Hotel reservations should be made through the San Francisco Convention and Visitors Bureau, 200 Civic Auditorium, San Francisco 2. Additional information may be obtained from the chairman of local arrangements, Dr. Laurance W. Kinsell, Highland Alameda County Hospital, 2701 Fourteenth Avenue, Oakland 6.

BLOOD BANKS FORM CLEARING HOUSE

The Texas Association of Blood Banks, meeting December 4 and 5 in Fort Worth, agreed to establish a clearing house for the exchange of blood between banks in the state. The clearing house will maintain an inventory of the types and quantity of blood available in participating banks, initiate the exchange of blood, record transactions and arrange for cancellation of indebtedness between banks, collect and pay processing fees, and maintain itself by a proration among member banks.

More than 100 delegates were present for the meeting, which included papers, panel and round-table discussions, a luncheon and a banquet, and a business meeting. Out-of-state participants in the program were Dr. John Upton, chairman of the California Blood Bank Commission, San Francisco; Mrs. Charles Hemphill, managing director of the Irwin Memorial Blood Bank, San Francisco; Dr. Sam Gibson, associate director of the blood program of the American National Red Cross, Washington; and Dr. Joseph A. Hertell, assistant national director of the American National Red Cross, Washington.

Dr. C. T. Ashworth, Fort Worth, was named president for the coming year; Dr. Jarrett Williams, Abilene, president-elect; Dr. O. J. Wollenman, Jr., Fort Worth, vice-president; Miss L. Jean Stubbins, M. T., Galveston, treasurer; and Miss Marjorie Saunders, Dallas, secretary. The 1954 meeting will be held December 3 and 4 in Abilene.

TEXAS RHEUMATISM ASSOCIATION

The Texas Rheumatism Association held its sixth annual meeting December 4 in Houston with Dr. Edward W. Boland, president-elect of the American Rheumatism Association, as special guest. Dr. J. C. Crager, Beaumont, president, presided; Dr. Jesse W. Hofer, Houston, was program chairman.

Dr. Alfred H. Harris, Dallas, was elected president; Dr. Howard C. Coggeshall, Dallas, first vice-president; Dr. Frank F. Parrish, Houston, second vice-president; and Dr. Charles H. Cornwell, Marlin, secretary-treasurer. Drs. C. C. Smith, Waco, and W. W. Moorman, Fort Worth, are new members of the board of governors.

The following program was presented:

Roentgenological Findings of Rheumatoid Arthritis and Rheumatoid Spondylitis—Dr. Vincent P. Collins, Houston.

Rheumatic Manifestations of Endocrine Diseases—Dr. E. L. Crain, Houston.

Mechanism of Action and Clinical Use of Probenecid in Gout—Dr. Ralph V. Ford, Houston.

Unusual Bone Tumors—Dr. John R. Thomas, Houston.

Conditions Producing Pain in Shoulder Girdle—Dr. Frank F. Parrish, Houston.

Neurological Disorders Simulating Rheumatic Diseases—Dr. Moses Ashkenazy, Houston.

Orthopedic Principles in Management of Rheumatoid Arthritis—Dr. Bedford F. Boylston, Houston.

Physical Medicine in Treatment of Rheumatoid Arthritis—Dr. Lewis A. Leavitt, Houston.

Present Status of Steroid Therapy in Rheumatoid Arthritis—Dr. Boland.

Dr. Boland also led informal discussions of the papers and an open question period. All other speakers are on the staff of Baylor University College of Medicine. Approximately eighty-five Texas physicians attended.

Reciprocity Applications Coming Due

Reciprocity applications must be complete thirty days prior to the time for examinations for licensure by the Texas State Board of Medical Examiners, Dr. M. H. Crabb, secretary, has reminded. The next examination session will be held June 21-23 at the Texas Hotel in Fort Worth.

Texans Enter College of Surgeons

Sixty-three Texas doctors of medicine became fellows in the American College of Surgeons at its 1953 convocation in October. The names released by the college are as follows:

Mack F. Bowyer, Abilene; William R. Klingensmith, Jr. and Walter C. Watkins, Amarillo; Percy R. Fayle and Robert O. Whitson, Baytown; Lamar C. Bevil, Kenneth T. Miller, and Charles L. Pentecost, Beaumont; Houston J. Zinn, Big Spring; George Dudley Moore, Jr. and Charles R. Nester, Canyon; Jack F. Fox, Childress; Sam R. Burnett, J. Harold Cheek, Vanda A. Davidson, Jr., Foster Fuqua, W. N. Fuqua, Jr., Arthur P. Gottlich, Henry G. Montgomery, Philip D. Newell, Donald L. Paulson, Robert R. Shaw, and Nathan Tobolowsky, Dallas; Haskell D. Hatfield and Morton H. Leonard, El Paso; J. Robert Harris, Rex J. Howard, and Hub E. Isaacks, Fort Worth.

Also Clifford C. Snyder, Galveston; George W. Duncan, Harlingen; Moses Ashkenazy, Frederick H. Aves, Bedford F. Boylston, Oscar Creech, Jr., Loren W. Haus, Boyd W. Haynes, Jr., George Robert Kolodny, Milbourne K. Leggett, Jack H. Mayfield, John W. Overstreet, George E. Rohrer, Bryan V. Williams, and Edward Carson Williams, Houston; J. Collier Rucker, Jacksonville; James H. Johnson, Jr., Longview; Robert T. Canon and Archie Lee Hewitt, Lubbock; Milton J. Loring and J. S. Roden, Midland; John B. Case, Graham M. Coffman, Phillip L. Day, Paul L. Gorsuch, James E. Pridgen, William W. Sawtelle, and Edwin M. Sykes, Jr., San Antonio; Hanes H. Brindley, Elihu I. Klein, and John F. McKenney, Jr., Temple; H. Gates Brelsford and Madison J. Lee, Jr., Tyler; Thomas R. Hunter, Jr., Wellington; and Charles H. Wilson, Wichita Falls.

Neuropsychiatric Session in Little Rock

Interested professional personnel have been invited to attend the sixth annual neuropsychiatric meeting to be held at the Veterans Administration Hospital, North Little Rock, February 25 and 26. There will be no charge for registration.

Guest lecturers who will participate include Drs. Kenneth E. Appel, president, American Psychiatric Association, Philadelphia; Franz Alexander, director, Chicago Institute for Psychoanalysis, Chicago; Francis J. Braceland, psychiatrist-in-chief, Institute of Living, Hartford, Conn.; Richard L. Jenkins, chief, Research Section, Psychiatry and Neurology Service, Department of Medicine and Surgery, Veterans Administration, Washington; William Malamud, professor of psychiatry, Boston University School of Medicine, Boston; Jules H. Masserman, neuropsychiatrist, Chicago; Henry G. Schwartz, professor of neurological surgery, Washington University, St. Louis; Harvey J. Tompkins, director, Psychiatry and Neurology Service, Department of Medicine and Surgery, Veterans Administration, Washington; Gregory Zilboorg, psychoanalyst, New York.

In addition to scientific sessions, there will be exhibits prepared by hospital staff members and a dinner the evening of February 25 at which Dr. Appel will be the principal speaker.

Additional information may be obtained from Dr. Ewin S. Chappell, director of professional education at the hospital.

EL PASO HAS NEW MEDICAL CENTER

A new El Paso medical center has nine professional buildings containing thirty-five suites and offices for doctors and dentists. A tenth building will house a prescription pharmacy and a restaurant.

The center is centrally located near the hospitals and will have ample parking facilities.

New Orleans Graduate Medical Assembly

The New Orleans Graduate Medical Assembly will hold its seventeenth annual meeting March 8-11, to be followed by a postclinical tour to Hawaii from Los Angeles by airplane and ship, March 14-April 6. Eighteen guest speakers will participate in the scientific program. Also on the agenda are symposiums, clinicopathologic conferences, round-table luncheons, three-dimensional surgical motion pictures, medical motion pictures, and technical exhibits.

The speakers will be Drs. Perry P. Volpitto, Augusta, Ga.; Earl D. Osborne, Buffalo; Julian M. Ruffin, Durham, N. C.; Allan C. Barnes, Cleveland; Walter C. Alvarez, St. Paul; William D. Stroud, Philadelphia; Lawrence C. Kolb, Rochester, Minn.; Nicholson J. Eastman, Baltimore; A. D. Ruedemann, Detroit; Oscar L. Miller, Charlotte, N. C.; Francis L. Lederer, Chicago; Emmerich von Hamm, Columbus, Ohio; Philip M. Stimson, New York; Brian Blades, Washington, D. C.; Samuel F. Marshall, Boston; Orvar Swenson, Boston; Charles D. Creevy, Minneapolis; and one other to be announced.

Registration fee of $20 is all-inclusive. Information concerning the assembly meeting or the tour is available from the secretary, Dr. Maurice E. St. Martin, 1430 Tulane Avenue, Room 103, New Orleans 12.

HYPERTENSION MORTALITY

Several tentative conclusions concerning mortality from essential hypertension have been reached as the result of a ten-year follow-up study of 646 persons suffering from the affliction by Drs. Robert S. Palmer and Hugo Meunch, Boston. Mortality was found to be greatest among young people, decreasing rapidly with age, and definitely lower in women, according to the doctors' report in the September 5 issue of *The Journal of the American Medical Association*. At the time the report was prepared, 453 patients were alive. The conclusions follow:

1. Relative risk is highest in the young and decreases rapidly with age.

2. Mortality in women is definitely lower (except in the more severe types) and increase of severity is slower. In the higher ages with the milder forms of hypertension, the mortality of women is approximately that of the general population.

3. The average age increases from those with very mild hypertension to those with more severe types. Each of the more severe types must be to some extent a later development of the previous one.

4. Duration of the disease, apart from advancing age, does not seem to have any effect on mortality, except in the most severe type in which short duration is associated with higher mortality at youngest ages.

5. With each increasing degree of hypertension, patients die at a faster rate than that expected of the general public. In general, this increase in mortality tends to diminish with time under observation or higher ages.

Treatment of the patients observed by the physicians was chiefly dietary according to conventional indications; ordinary rules of good hygiene and simple psychotherapy were varied and adapted to the particular patient.

Chest Disease Course Set for New Orleans

Postgraduate courses in diseases of the chest are being sponsored by the American College of Chest Physicians in New Orleans, February 15-19, and in Philadelphia, March 15-19. Tuition for each course is $75. Additional details may be obtained from the Executive Director, American College of Chest Physicians, 112 East Chestnut Street, Chicago 11.

OKLAHOMA ACADEMY OF GENERAL PRACTICE

The Oklahoma Academy of General Practice will meet in Tulsa February 15-17 to hear the following speakers: Dr. William F. Guerriero, Dallas; Dr. Horace L. Hodes, New York; Dr. Manuel E. Lichtenstein, Chicago; Dr. Perrin H. Long, Brooklyn; Dr. Carlo Scuderi, Chicago; Dr. Harry Wilkins, Oklahoma City; and other outstanding speakers presented by Lederle Laboratories in conjunction with the convention. There is no registration fee, and Texas physicians will be welcome.

A public forum on children's diseases will be held February 16, and a banquet, breakfast, and entertainment also are scheduled. A luncheon and style show will be held for wives.

Further information may be obtained from the president, Dr. Marshall O. Hart, 1228 South Boulder, Tulsa 5.

Aspirin in Respiratory Disorders

In patients suffering from such acute respiratory infections as influenza, bronchitis, and the common cold, aspirin produces normal temperatures more speedily than Terramycin and Erythromycin, according to an article in the September 26 *Journal of the American Medical Association*. The findings of a team of United States Air Force doctors show that aspirin brought the patients' temperature down to normal in an average of thirty hours as compared with forty-one hours for Terramycin and forty-two hours for Erythromycin. The evidence indicates that the antibiotic drugs had no influence on the course of these diseases nor was the use of these drugs necessary since no secondary bacterial infections developed in any of the patients tested.

"The patients who were given aspirin usually felt better sooner than those who were receiving either terramycin or erythromycin," the article states. The patients in the study were 150 airmen with respiratory diseases, the majority believed to be of the influenza-like type. A 600 mg. dose of aspirin was administered to a group of 54 patients with follow-up doses for each group at six-hour intervals. With the exception of some tiredness and a dry cough, such symptoms as headache, general muscular aches, and sore throats disappeared once the fever in all patients returned to normal.

Since no specific cure for common virus infections is now available, the doctors state, "any measure that will limit or minimize the duration of the illness is important."

The study was conducted by Capt. Philip N. Jones, Major Roy S. Bigham, Jr., and Lt. Phil R. Manning, from the Chanute Air Force Base in Illinois.

Medical Aid Needed in Asia

The barest necessities of hospital and medical equipment are needed in the nearly 300 hospitals in India and surrounding Southeast Asian countries, and a joint program of CARE and the World Health Organization, approved by the American Medical Association and its Auxiliary, is attempting to fill this need. About $1,750,000 is needed to take care of the minimum requirements of bed linen, surgical instruments, sterilizers, and laboratory apparatus, according to a survey by WHO.

Purchasing, shipping, and delivering has been put in the hands of CARE, a nonprofit, cooperative agency composed of twenty-seven major American welfare agencies which for the past seven years has channelled American aid in the form of 15,000,000 food, textile, and "self-help" tool packages, books, and other equipment totalling more than $150,000,000 to needy people and institutions in more than thirty overseas countries.

Donations to the project may be forwarded to CARE, 660 First Avenue, New York 16.

PERSONALS

Dr. Lawrence M. Shefts, San Antonio, lectured and performed surgery for a postgraduate course in chest surgery at the medical school of the University of Nuevo Leon, Monterrey, Mexico, in October.

Dr. G. V. Brindley, Temple, has been elected chairman of the Medical and Scientific Committee of the American Cancer Society. Dr. Brindley is chairman of the executive committee of the Texas division and a member of the national board of directors.

Dr. Oren H. Chandler, Ballinger, has been named president of the board of trustees of Howard Payne College, Brownwood. Dr. Chandler has been a trustee for twelve years and vice-president the past two years.

Dr. W. Earl Reed, San Juan, is president of the Pharr Kiwanis Club.

Dr. Perry R. Jeter, Childress, was named Lion of the Month for September by the local Lions Club.

Dr. J. R. McGee, New Boston, first General Practitioner of the Year in Texas, and *Dr. J. H. McCracken,* Mineral Wells, past president of the Texas Medical Association, were among the physicians in practice fifty years or more who were honored by the University of Tennessee, Memphis, this fall. Certificates of honor were presented to them in recognition of their service.

Dr. John Q. Rounsaville, Dallas, has been named medical director of the National Bankers Life Insurance Company.

The father of *Dr. Warren G. Knox,* Fort Worth, died November 23 at Roby.

Mrs. Felix Peebles, mother of *Dr. Felix Peebles, Jr.* of Lufkin, died in Jefferson October 21.

Dr. and Mrs. John R. Thomas, Corpus Christi, were honored at a reception given by their children October 24 in Corpus Christi in observance of their golden wedding anniversary.

Dr. Albert Wilson Harrison and Miss Florence Adelaide Gask were married October 31 in Daytona Beach, Fla. They reside in Galveston.

Dr. and Mrs. O. T. Kirksey, Galveston, and *Dr. and Mrs. Bernard Rosen,* Corsicana, are recent parents of sons; *Dr. and Mrs. R. V. Jones,* Houston, are parents of a daughter.

Dr. and Mrs. W. Compere Basom, El Paso, are parents of a boy, Robert Compere, born December 5.

Hospital Construction Progress

The Texas State Department of Health recently issued its annual plan for construction of hospitals and public health centers, which in reality is a report of progress made since funds from the Hill-Burton hospital survey and construction act adopted by the United States Congress became available in 1947 and a summary of anticipated activity making use of those funds in the future.

The report shows that 133 projects have been approved, of which 86 have been completed, 21 are under construction, 8 are not yet under contract, and 18 have been withdrawn. The 115 projects completed or now scheduled for construction include 89 general hospitals, 4 hospitals for chronically ill patients, 6 tuberculosis hospitals, 2 hospitals for nervous and mental diseases, 6 public health centers, 3 nurses' homes, 4 equipment projects, and 1 expansion of the state laboratory. The hospitals provide for an additional 8,988 beds.

For the future, the areas of greatest need and specific ameliorative projects are defined in the report. Possible sponsoring agencies for these projects will be encouraged to apply for assistance, but the proposed overall plan will be modified as necessary.

Operating under the general direction of the State Board of Health, the hospital survey and construction division of the State Department of Health also has a state advisory council of twelve members. Four vacancies on the council now exist; Drs. R. W. Kimbro, Cleburne; Joe D. Nichols, Atlanta; and James T. Lee, Wichita Falls, are among the members.

CARDIOVASCULAR COURSE IN HOUSTON

A combination of hospital ward rounds, conferences, and demonstrations and of evening lectures will be used in the cardiology course to be held February 15-19 in Houston. The course is sponsored jointly by the University of Texas Postgraduate School of Medicine and Baylor University College of Medicine in association with the Houston Heart Association, Texas Medical Association, Texas State Department of Health, Houston Society of Internal Medicine, and Houston Academy of General Practice.

Visiting lecturers will include Dr. Robert H. Bayley, professor of medicine, University of Oklahoma, Oklahoma City; Dr. Arthur Grollman, professor of experimental medicine, Southwestern Medical School of the University of Texas, Dallas; Dr. George Herrmann, professor of medicine, University of Texas Medical Branch, Galveston; Dr. Donald Seldin, professor of medicine, Southwestern Medical School, Dallas; and Dr. Henry M. Winans, emeritus professor of medicine, Southwestern Medical School, Dallas. Fifteen local faculty members will participate, and the staffs of Hermann, Jefferson Davis, M. D. Anderson, Memorial, Methodist, St. Joseph's, and Veterans Administration Hospitals will cooperate.

Newer diagnostic procedures; cardiac surgery and anesthesia; treatment of heart failure, shock, and hypertension; special problems of etiology and therapy; and other subjects of current interest are scheduled for consideration. The course will provide twenty-five hours of formal credit by the American Academy of General Practice.

The registration fee of $25 may be sent to the University of Texas Postgraduate School of Medicine, 1400 Outer Belt Drive, Houston 25, from which additional information also may be obtained.

Wichita Falls Tumor Conference

The third annual State Tumor Conference sponsored by the Wichita County Medical Society Tumor Clinic, the American Cancer Society, and the State Department of Health will be held March 13 in the main auditorium of Midwestern University in Wichita Falls. This clinic, which is approved for credit in formal postgraduate training, is open to physicians without payment of a registration fee.

The program follows:

Address of Welcome—Dr. James T. Lee, Wichita Falls, President of Wichita County Medical Society.
Diagnosis and Treatment of Cancer of Thyroid—Dr. Shields Warren, Boston, New England Deaconess Hospital.
Early Diagnosis and Treatment of Caocer of Stomach—Dr. Alton Ochsner, New Orleans, Tulane University School of Medicine.
Caocer in General Practice—Dr. Jesshill Love, Louisville, St. Joseph Infirmary.
Radioisotopes in Treatment of Tumors—Dr. Warren.
Early Diagnosis of Cancer of Lung—Dr. Ochsner.
Treament of Maligoaot Disease—Dr. Love.

Dr. Bailey R. Collins, director of the clinic, will preside over the morning session; Dr. David H. Allen over the afternoon session. Luncheon at the Midwestern University Cafeteria and morning and afternoon recesses are on the schedule, and the day will be ended with a question and answer period.

INTERNATIONAL MEDICAL MEETINGS

Announcements have been made of several international meetings of medical interest:

Congress of Pan American Association of Ophthalmology, Brazilian Congress of Ophthalmology, and *International Congress of Oto-Neuro-Ophthalmology,* June 17-21, Sao Paulo, Brazil. Interested physicians are invited to participate in these three events for a registration fee of $10, which also will cover a number of social events planned in connection with Sao Paulo's four hundredth anniversary. Dr. Daniel B. Kirby, 780 Park Avenue, New York, United States representative on the council of the Pan American Association, can give further details.

International Cancer Congress, July 23-29, Sao Paulo, Brazil. Interested physicians may attend this sixth congress sponsored by the International Union Against Cancer, at which fundamental research, clinical studies, and control of cancer will be considered. Travel by ship and plane and special South American tours are being arranged for visitors from the United States, and financial assistance to cover part of the travel costs is available to a limited number. Further details may be obtained from the Chairman, National Committee on the International Union Against Cancer, National Research Council, 2101 Constitution Avenue, N. W., Washington 25, D. C.

International Congress of Internal Medicine, September 15-18, Stockholm, Sweden. The International Society of Internal Medicine, representing forty nations, will sponsor a program including symposiums on hypertension and collagen diseases and a variety of other papers. Visits to hospitals and scientific institutions are on the agenda. Professor Nanna Svartz, Caroline Medical Institute, Stockholm, is chairman of the planning committee and president of the society.

International Congress on Diseases of the Chest, October 4-8, Barcelona, Spain. All aspects of chest diseases, including cardiorespiratory function and inhalation therapy, will be covered in this world congress. The program will include papers, motion pictures, and scientific and technical exhibits. Murray Kornfeld, executive director of the American College of Chest Physicians, the sponsoring agency, has additional information and may be addressed at 112 East Chestnut, Chicago 11.

MISSISSIPPI VALLEY ESSAY CONTEST

A $100 cash prize, a gold medal, and a certificate are being offered for the best unpublished essay on any subject of general medical interest (including medical economics and education) and of practical value to the general practitioner by the Mississippi Valley Medical Society. Resident citizens of the United States who are members of the American Medical Association may compete. Manuscripts up to 5,000 words must be submitted by May 1. Further information is available from Dr. Harold Swanberg, Secretary, Mississippi Valley Medical Society, 209-224 W.C.U. Building, Quincy, Ill.

UNIVERSITY OF TEXAS MEDICAL BRANCH

December visitors at the University of Texas Medical Branch, Galveston, included David E. Green, Ph. D., director of the Enzyme Institute, University of Wisconsin, Madison; Burton L. Baker, Ph. D., University of Michigan, Ann Arbor; and William C. Rose, Ph. D., professor of biochemistry and nutrition, University of Illinois, Urbana.

Dr. Harriet Felton, professor of pediatrics at the Medical Branch, presented an exhibit on her work to develop a new vaccine for whooping cough at the recent meeting of the American Academy of Pediatrics at Miami.

PRIVATE CLINICS AND HOSPITALS OF TEXAS

Dr. W. R. Swanson, Taylor, assumed duties as president of the Private Clinics and Hospitals Association of Texas at the group's annual meeting December 4-6 in Austin. Other officers are Drs. Neil Buie, Marlin, president-elect; R. D. Holt, Meridian, vice-president; John Dupree, Levelland, secretary-treasurer; and William Blair, Wharton, editor-in-chief.

The program included round-table discussions of problems of privately owned clinics and hospitals in such areas as nursing care, insurance, food, and laboratory service. Leaders of the discussions were Drs. Harvey Renger, Hallettsville; J. P. Anderson, Brady; Van D. Goodall, Clifton; Dupree; Buie; Gilbert Casey, Jacksonville; and Kline S. Dewees, Wills Point. Dr. Joe Nichols, Atlanta; William R. Hunt, Waco; and Bill Burton, El Paso, spoke at the luncheons, and Dr. S. D. Coleman, Navasota, gave the president's address.

SOUTHWESTERN MEDICAL SCHOOL

Dr. William F. Mengert, head of the Department of Obstetrics and Gynecology at Southwestern Medical School of the University of Texas, Dallas, became president of the American Academy of Obstetrics and Gynecology at its meeting in Cincinnati on December 14.

Dr. Hans Selye, director of the Institute of Experimental Medicine and Surgery at the University of Montreal, delivered the Phi Delta Epsilon lecture at Southwestern Medical School of the University of Texas, Dallas, on October 24, using as his subject "The General Adaptation Syndrome."

S. Edward Sulkin, Ph. D., professor of bacteriology at Southwestern Medical School of the University of Texas, Dallas, joined researchers from five countries at the International Symposium on Dynamics of Virus Infections October 21-23 in Detroit.

SOUTHWESTERN MEDICAL ASSOCIATION

Dr. Willard W. Schuessler, El Paso, was installed as president of the Southwestern Medical Association at its thirty-fifth annual meeting October 29-31 in Tucson, Ariz. Other officers elected by the 260 physicians present from Arizona, New Mexico, West Texas, and Northern Mexico follow: Dr. Joseph Bank, Phoenix, president-elect; Dr. N. K. Thomas, Tucson, first vice-president; Dr. John H. Dettweiler, Albuquerque, second vice-president; Dr. Leslie Daviet, Las Cruces, N. M., third vice-president; and Dr. Celso C. Stapp, El Paso, secretary-treasurer.

On the scientific program were Drs. Merl J. Carson, Glendale, Calif.; Donovan C. Browne, New Orleans; Edmund B. Spaeth, Philadelphia; William Paul Thompson, Los Angeles; and Henry K. Ransom, Ann Arbor, Mich.

Baylor Hospital Celebrates Half Century

Baylor Hospital in Dallas on October 16 celebrated fifty years of being chartered by the State of Texas as a hospital. Observance of the occasion included a five-day series of tours for visitors, a banquet with United States Senator Price Daniel as chief speaker, coffees honoring Baylor Nurses' Alumnae and the Baylor Woman's Auxiliary, and dinners for employees and for the medical staff.

Harris County General Practitioners Elect

The Harris County Academy of General Practice has announced the election of officers for 1954 as follows: Dr. Donald M. Gready, president; Dr. William F. Cole, president-elect; Dr. Milton Littell, vice-president; Dr. Ben Walpole, secretary; Dr. Homer A. Taylor, treasurer; Dr. A. C. Madsen, director.

LIBRARY SECTION

GLAUCOMA

To avoid the easy error of assuming we are racing along abreast of an always fast and sure current of medical progress, a deliberate backward look can be sobering. Consider that there exists a twenty-three century old description of glaucoma, that it was some four centuries after this description before any difference between glaucoma and cataract was hinted by Rufus, and that another six hundred years elapsed before a written account by Paulus Aegineta of actual symptomatic differences was made. Aegineta, incidentally, remarked, "Glaucoma is in every case incurable," an opinion repeated as late as 1858 by Desmarres. Consider that the entire Greek-Roman period and the Dark Ages provided little more than recognition of the disease, failing adequately to separate it from cataract, and that this state of affairs continued approximately the same until the appearance of a book by Brisseau in 1709. Consider the remarkable fact that although a condition of firmness or hardness of the glaucomatous eye was recognized in 1622 by Barrister, more than a hundred years passed before general appreciation of the requirement of increased intraocular pressure followed the description of the association by Platner in 1745 and again particularly by Bowman in 1858. Indeed, remember that it was some twenty-two centuries after the Hippocratic description before one appeared by Weller in 1826 which was substantially correct and useful even by today's standards.

The stream of medicine quickened in the nineteenth century, and ophthalmology was no exception. Largely because of von Helmholz's ophthalmoscope, there developed almost automatically a voluminous literature about glaucoma and other subjects. Small, slowing eddies appeared, as evidenced by the misconception about the optic disk in glaucoma; Jaeger and even von Graefe believed it bulged forward rather than being cupped. That giant of ophthalmology, von Graefe, whose incalculably valuable operation (iridectomy) was announced when he was but 22 years of age, required some time before he was completely convinced that hardness of the eyeball was the cause of blindness, since he required proof of concavity of the nerve head. Iridectomy initially seemed phenomenally successful and was almost the sole surgical attack for the subsequent fifty years, although its mode of action was by no means understood for most of that period, even by the originator. Von Graefe felt that every practitioner should be able to diagnose glaucoma, still a desideratum as evidenced by the motion picture film, "Glaucoma: What the General Practitioner Should Know," now available at the Texas Medical Association Memorial Library.

Consider that miotics were introduced as late as 1877 and that the palpating finger estimation of intraocular pressure or tension was only replaced following the announcement of Schiøtz's tonometer in the period 1905-1910. And recall that it is really of only late years that we at last seem able to be categorical about some of the types of glaucoma. In any case, it is the recollection of what has gone before—and the time it took—that will cause a natural hesitancy when it comes to predicting which of more recent observations shall prove lastingly helpful or astonishingly neglected. Yet, there would seem no way any physician can reasonably fail to heed modern words such as these of Kirby:

"Patients, unguided and unhelped, or treated by persons not trained in the detection, recognition and modern treatment of glaucoma, are inevitably destined for blindness. With early recognition, proper treatment and supervision, the condition is serious but the prospects for recovery are usually excellent and useful vision can be maintained. A knowledge of the early symptoms of glaucoma is essential so that timely, remedial measures may be taken while they are still of great value."

Now Texas physicians easily can obtain the previously mentioned film about glaucoma produced by the National Society for the Prevention of Blindness, Inc. From it, we may all be assisted in "early recognition, proper treatment and supervision," thus to keep abreast of the current of medicine, whatever its present speed of movement.

—SAM N. KEY, JR., M. D., Austin.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library of the following recent gifts:

Dr. T. J. Archer, Austin, 95 journals.

Dr. Robert Franken, Austin, 2 journals.

Dr. P. I. Nixon, San Antonio, "Medical Ethics," 1803, by Thomas Percival.

Dr. Morris Polsky, Austin, 130 journals.

Dr. Henry Renfert, Austin, 1 book.

Dr. Earl L. Yeakel, Jr., Austin, 10 journals.

Unusual Gift to Library

Dr. E. E. Lowrey, Gatesville, has given the Library an anatomic model of the skull. The model has a hinged jaw, and the calvarium is cut and may be removed. Made of hard, rigid ivory plastic, the realistic skull has all vascular and neural openings present, and the bone structure and sutures are reproduced.

MOTION PICTURES FOR LOAN

Drug Addiction

16 mm., sound, 21 minutes. (Purchased by Texas Medical Association Memorial Library.)

This is a dramatic and straightforward story of the hazards of narcotic drugs. It depicts with stark realism all phases of this problem, particularly as it affects teenagers. The film explains the derivation of heroin, marijuana, and cocaine and employs animated drawings to describe their physiologic effects. The connection between drug addiction and crime is noted, and the highlights of a typical case are dramatized.

Surgical Treatment for Carcinoma of Lower End of Esophagus

16 mm., silent, color, 42 minutes. (Courtesy of Dr. Philip Thorek, Chicago.)

This film presents a case in which carcinoma of the cardiac end of the stomach extends into the esophagus. A transthoracic partial esophagogastrectomy is performed with an end-to-side esophagogastrostomy. Roentgen-ray studies and the patient's postoperative course are included.

Hemicolectomy for Carcinoma of Right Side of Colon

16 mm., silent, color, 22 minutes. (Courtesy of Dr. Philip Thorek, Chicago.)

Surgical treatment for adenocarcinoma of the ascending colon is presented in the film. Following mobilization of the ascending colon in the proper avascular cleavage plane, the last 6 inches of ileum, cecum, ascending colon, hepatic flexure, and proximal half of the transverse colon are removed. An aseptic end-to-end ileo transverse colostomy is performed. Preoperative and postoperative roentgenograms and the patient one year postoperatively are shown.

Treatment of Varicose Veins

16 mm., silent, color, 30 minutes. (Courtesy of G. D. Searle and Company.)

This film includes a discussion of the venous anatomy of the leg, demonstrates by animation the various types of varicosities, and shows the treatment of each type. A test to determine the adequacy of collateral circulation is demonstrated. This is an excellent film for general practitioners and surgeons.

What Is Cancer?

16 mm., sound, color, 30 minutes. (Courtesy of Texas Cancer Coordinating Council, Austin.)

Designed especially for nurses and nursing trainees, this film is helpful in explaining the problem of cancer from a nurse's standpoint. This film is excellent for nurses and hospital groups. Physicians concerned with nursing education programs will find this a valuable adjunct to their lectures.

BOOK NOTICES

[1]Introduction to Physiological Optics

ARMIN VON TSCHERMAK-SEYSENEGG, *University of Munich, Regensburg Extension. Translation sponsored by the American Committee on Optics and Visual Physiology of the Section on Ophthalmology, American Medical Association; American Ophthalmological Society; and American Academy of Ophthalmology and Otolaryngology. Translated by* PAUL BOEDER, PH. D., *Instructor in Ophthalmology, Harvard Medical School, 298 pages. $10.50. Springfield, Ill., Charles C Thomas, 1952.*

The student who looks for information on physiology of vision finds relatively scanty information in the English ophthalmic and physiologic literature. Hence this monograph is an effort to arouse primarily an interest of larger ophthalmologic groups in physiologic optics and to invite them to practical evaluation. It is a masterly survey of the physiology of vision, especially in the physiology of binocular vision and ocular motility.

The book is divided into six chapters, the first dealing with the optic image, its significance and formulation. The second deals with an introduction to the light sense, photometric and physiologic factors. This stresses that according to the method of exact subjectivism, the treatment of the light-color sense must not begin with the physical discussion of the light stimulus but with the analysis of the physiologic effect. This basic conception opposes the older objectivistic conception which asserted direct perception through the sensory tools or at least a simple causal connection between stimulus and effect.

Following this is an introduction to color sense, giving a

[1]*J. W. Pickens, M. D., Cleburne.*

general description of the character of color sensations, relationship of wave length, intensity, and composition of light stimuli, and the qualities of color sensation.

The latter part of this monograph discusses binocular space sense and the physiology of ocular movements, giving special attention to retinal correspondence and to the laws governing the movements of the eye.

The author of the book concludes that "In spite of the unavoidable incompleteness of the presentation and in spite of the perhaps somewhat strongly subjective coloring,... the harmony of the resulting picture should not be overlooked."

[2]Office Psychiatry

LOUIS G. MOENCH, M. D., *Assistant Clinical Professor of Medicine and of Psychiatry, University of Utah School of Medicine. 310 pages. $6. Chicago, Year Book Publishers, 1952.*

This is an exceptionally fine book in that it accomplishes well the author's desire of acquainting the general practitioner, the nonpsychiatric specialist, and the medical student with the more valued contributions of psychiatry to the practice of medicine.

The book is comprehensive in scope but leaves out all of the argumentative and controversial afflictions of psychiatry. At times oversimplification might seem to defeat the author's purpose, but on the whole probably it will stimulate the readers to investigation of the references in his bibliography.

I was impressed particularly with the introductory chapters and the chapter entitled "The Interview."

Throughout the text there are numerous caricatural illustrations that cleverly emphasize important interpersonal situations and possibly some pet peeves of the author.

A combination of excellent writing technique with adequate understanding of the prospective readers definitely increases the value of this contribution.

[3]Contact Dermatitis

GEORGE L. WALDBOTT, M. D., F.A.C.P., *Senior Physician, Harper Hospital; Chief of Division of Allergy, Grace Hospital; Chief of Allergy Clinic, Children's Hospital of Michigan, Detroit. Edited by* ARTHUR C. CURTIS, M. D., *Chairman, Department of Dermatology and Syphilology, University of Michigan, Ann Arbor. A Monograph in the Bannerston Division of American Lectures in Dermatology. 218 pages. $8.75. Springfield, Ill., Charles C Thomas, Publisher, 1953.*

The interrelated fields of allergy and dermatology are correlated in this work on a dermatologic subject by an allergist. It is a striking departure from the usual "cut and dried" style of the ordinary textbook, and it makes good reading.

The book covers incidence, mechanism, pathology, and diagnosis in an abbreviated form, and these chapters present no unusual features. One still must be familiar with clinical dermatology to diagnose contact dermatitis. The real value of the book appears in the chapters devoted to determination of the causes and "the pattern." The author has devised a method of marking the exposed surfaces of skin in such a way as to denote the contact areas and to group the patterns according to the causes, as, for instance, the "reaching into" pattern, the "finger grasp" pattern, and the "large ball" or "small ball" patterns. By referring to the pattern of a dermatitis, the detective job of the clinician is greatly aided, and clues are ascertained by which deductions may be made, the appropriate tests performed, and the guilty antigen may be indicated.

In a section on "Special Situations," plants, pollen, cosmetics, soap, wearing apparel, industrial irritants, drugs, and the like are discussed as sources of dermatitis. The author rightly evaluates the psychosomatic aspect of skin diseases, notably disposing of "nervousness" as the cause for every otherwise unexplainable condition.

Therapy of allergic dermatoses is well covered, and the point of avoidance of further aggravation by ill chosen medicaments is well taken.

The appendices, tables, and bibliography are good. The author has indulged in worthy consultations, and his editor, a dermatologist of note, was well chosen. There is a glossary inserted for the benefit of "non-medical readers." Undoubtedly, this book will be read by many such readers, but whether or not the glossary will enable them to place the proper interpretation upon the subject matter is, to this observer, highly problematical.

[4]Gifford's Textbook of Ophthalmology

FRANCIS HEED ADLER, M. D., *Professor of Ophthalmology, University of Pennsylvania Medical School; Consulting Surgeon, Wills Eye Hospital, Philadelphia. Fifth edition. $7.50. Philadelphia, W. B. Saunders Company, 1953.*

This work is designed primarily for the instruction of undergraduates in medicine and for physicians not specializing in the practice of ophthalmology.

Each of the twenty-two chapters contains a thorough discussion of the subject to which it pertains. The anatomy and physiology of the various parts and structures are given. Aside from an occasional mention, surgical techniques are entirely eliminated. Treatment of the various ocular diseases and injuries (other than surgical) is presented quite extensively. Hypertensive diseases and diabetes are presented in more than average detail.

The entire contents of this edition are presented in a clear, concise but comprehensive manner, with superfluous details and verbiage eliminated.

This is a textbook that should be of ultimate value to the undergraduate student of medicine, to practitioners, and most particularly to those engaged in general practice. It will be a valuable adjunct to every medical library.

[5]Hypersplenism—A Clinical Evaluation

CYRUS C. STURGIS, M. D., *Chairman of the Department of Internal Medicine and Director of the Thomas Henry Simpson Memorial Institute for Medical Research, University of Michigan. A Monograph in American Lectures in Medicine. 97 pages. $3.25. Springfield, Ill., Charles C Thomas, 1953.*

This monograph is the William Beaumont Lecture delivered to the Wayne County (Michigan) Medical Society in January, 1952. The entire problem of hypersplenism is presented with a review of the literature in a concise and unbiased manner. The subject is defined and a summary of the current ideas concerning the functions and circulation of the spleen is included. The possible mechanisms of the hypersplenic state are discussed, following which the author classifies and discusses the types of hypersplenism specifically as regards etiology, pathology, signs and symptoms, laboratory findings, diagnosis, and treatment. Occasional case histories with the charted laboratory findings serve to enhance the value of the text. The bibliography and index are adequate. All in all, this monograph is a satisfactory compendium of the general problem as it is understood today. It can be recommended to medical students, general practitioners, and internists.

[2]*F. T. Harrington, M. D., Dallas.*

Clinical Diagnosis by Laboratory Methods

JAMES CAMPBELL TODD, Ph. B., M. D., *Late Professor of Clinical Pathology, University of Colorado School of Medicine, Denver;* ARTHUR HAWLEY SANFORD, M. D., *Emeritus Professor of Clinical Pathology, The Mayo Foundation, University of Minnesota, Minneapolis; Emeritus Member, Division of Clinical Laboratories, The Mayo Clinic, Rochester; Director of Laboratories, Rochester State Hospital; and* BENJAMIN B. WELLS, M. D., Ph. D., *Professor of Medicine, Department of Medicine, School of Medicine, University of Arkansas, Little Rock. Twelfth edition. 998 pages. $8.50. Philadelphia, W. B. Saunders Company, 1953.*

The new edition of a standard textbook in medicine has been brought up to date, with the section on hematology being rewritten and many new additions to the chapter on serology being made. Each test is explained step by step and many tests are so simplified that they can be performed in the office without any special equipment. Every possible result of each test has been considered, and the significance of each in the clinical picture is given.

The index outline of laboratory findings arranged in alphabetical order adds to the value of this well known reference tool.

[6]Physiological and Therapeutic Effects of Corticotropin (ACTH) and Cortisone

DWIGHT J. INGLE, Ph. D., *Senior Research Scientist (Physiologist), The Upjohn Company, Kalamazoo, Mich.; and* BURTON L. BAKER, Ph. D., *Professor of Anatomy, University of Michigan Medical School, Ann Arbor. A Monograph in American Lectures in Metabolism. 172 pages. $5.50. Springfield, Ill., Charles C Thomas, 1953.*

This monograph is an effort on the part of two research scientists to compile all the known information about the adrenal cortical hormones in a readable form for the average physician. The first seventy-five pages deal with the nature of the various hormones and with their effects on normal and abnormal tissue. They show step by step how work regarding these hormones is carried out on experimental animals, on persons with Addison's disease, and in various other disease processes. Diseases in which the hormones have been used are discussed. Beneficial results, where obtained, are described and weighed against the undesirable side effects in an effort to determine their actual value.

This book is not written with a viewpoint of being used in day to day practice but rather to give the reader a good general idea about the whole field in a few pages. An extensive bibliography covering thirty-one pages is found at the end of the book. I found it a very interesting book to read, but I doubt its value in the average physician's library.

[7]Hormonal and Neurogenic Cardiovascular Disorders

WILHELM RAAB, M. D., F.A.C.P., F.A.C.C., F.C.C.P., *Professor of Experimental Medicine and Head of Cardiovascular Research Unit, University of Vermont, Burlington. 722 pages. $15. Baltimore, Williams and Wilkins Company, 1953.*

The author's purpose is "to convince cardiologists and other physicians that neuroendocrine and endocrine influences play a fundamental and decisive part in the origin and therapeutic amenability of many cardiovascular disorders." In this he has admirably succeeded.

The book is divided into three main sections: experimental cardiovascular effects of hormones and neurohormones, cardiovascular features in endocrine and neuroendocrine syndromes, and endocrine and neuroendocrine factors in cardiovascular syndromes.

There are helpful summaries of individual chapters. Each section has a synopsis. The book concludes with a general summary and more than 3,000 references to the literature.

The reviewer noted only one error; in Read's formula on page 129 "the pulse rate" should be corrected to "the pulse pressure."

This book is heartily recommended to those interested in the fields of endocrinology and cardiovascular diseases.

[8]Amebiasis: Pathology, Diagnosis and Chemotherapy

HAMILTON H. ANDERSON, M. D., *Professor and Chairman, Pharmacology and Experimental Therapeutics;* WARREN L. BOSTICK, M. D., *Associate Professor of Pathology, Department of Pathology; and* HERBERT G. JOHNSTONE, Ph. D., *Professor of Parasitology, Parasitology and Mycology Section of the Department of Medicine, School of Medicine, University of California Medical Center, San Francisco. 431 pages. $11.50. Springfield, Ill., Charles C Thomas, 1953.*

This book is one of the best that has been brought out in regard to amebiasis. It covers the subject thoroughly, is well planned, and goes into adequate detail. Controversial points are well handled and discussed, and these are presented in an unbiased manner.

The authors make every attempt to do away with the commonly accepted symptom of dysentery as one of the most looked-for symptoms in amebiasis. It has been shown repeatedly that dysentery itself is not infrequently absent in amebiasis, and this fact alone is well worth bringing before the profession as a whole.

The book is divided into convenient chapters, each of which goes thoroughly into its particular aspect of amebiasis, and at the end of each chapter is an extensive bibliography. For the general practitioner, the chapters dealing with symptomatology and clinical manifestations and with laboratory diagnosis of amebiasis are especially well presented.

[9]Clinical Cardiology

Edited by FRANKLIN C. MASSEY, A. B., M. D., *Assistant Professor of Medicine, Hahnemann Medical College, Philadelphia. 1,060 pages. $13.50. Baltimore, Williams and Wilkins Company, 1953.*

This book contains several excellent chapters, but as a whole it does not compare favorably with other available textbooks of cardiology. Written by thirty-three collaborators, it lacks that warm, almost personal relationship that should be obtained between author and reader. In addition, while the editor admits in his preface that multiple authorship often involves poor continuity and perspective, he has not always offset these defects by choosing contributors of invariably high standards of scholarship and experience.

The chapter on surgery of the heart is especially commendable. Also authoritative and readable are the sections on fundamentals (as opposed to clinical aspects) of coronary circulation, endocarditis, and roentgenology. Electrocardiography is reliably presented but too compressed and the illustrations too few. Schemm's discussion of congestive failure is stimulating, though his understandable enthusiasm for his own ideas has led him to slight other useful therapeutic measures. Illustrations in the book range from strikingly beautiful to inartistic, and many of the bibliographies are incomplete.

Misleading errors of fact are numerous. That intensity alone will distinguish functional from organic murmurs is

[6]*W. S. Rhode, M. D., Colorado City.*
[7]*H. L. Wolf, M. D., Amarillo.*
[8]*O. B. Gober, M. D., Temple.*
[9]*Royall M. Calder, M. D., San Antonio.*

debatable and that organic cardiac lesions never alter the first pulmonic sound is patently erroneous. Few clinicians would agree that it is "nonsense" to administer quinidine for the prevention of possibly fatal arrhythmias complicating myocardial infarction or that it is impossible to master the art of percussing the heart. Likewise, believing that uncomplicated neurocirculatory asthenia is often characterized by fever might well lull an immature clinician into overlooking a remedial infection.

Muscle metabolism is ignored and dosages and pharmacology of drugs (even digitalis) often are treated in a sketchy fashion. Ouabain, digitalis glucosides, and many other drugs of established usefulness are not mentioned.

Striving for elegance of style has resulted frequently in declamations rather than simple, informative exposition and in the misuse of big words when little ones would have served. Occasional neologisms, unacceptable abbreviations, mistakes in simple grammar, and innumerable misspelled words bespeak indifferent editing.

This reviewer has read every page of this text, is not a competing author, and is disappointed that the unquestionably good features of this book do not outweigh the bad.

[10]Hypnosis in Modern Medicine

Edited by JEROME M. SCHNECK, M. D., *Clinical Associate in Psychiatry, College of Medicine, State University of New York; Founder and President, Society for Clinical and Experimental Hypnosis. 323 pages. $7.50. Springfield, Ill., Charles C Thomas, 1953.*

This book is composed of eleven separate chapters, each written by a different investigator and each having an extensive bibliography appended to it. Through this type of organization the author has attempted to bring under one cover the experience and knowledge of certain selected authorities who are proficient in their respective areas of interest within the broader field of hypnosis in its relationship to medicine. The book offers interesting information on the history of hypnosis and its use in various of the specialties of medicine, surgery, and dentistry.

There is an especially interesting chapter on the physiologic aspects of hypnosis.

This publication can be read with ease and offers an opportunity for every physician to become more informed on a subject which is both controversial and somewhat neglected in the medical preparation of the average physician.

[10]*Anthony P. Rousos, M. D., Austin.*

[11]Physical Examination of the Surgical Patient

J. ENGLEBERT DUNPHY, M. D., F.A.C.S., *Associate Clinical Professor of Surgery, Harvard Medical School; Surgeon, Peter Bent Brigham Hospital, and* THOMAS W. BOTSFORD, M. D., F.A.C.S., *Clinical Associate in Surgery, Harvard Medical School; Senior Associate in Surgery, Peter Bent Brigham Hospital. 326 pages. $7.50. Philadelphia, W. B. Saunders Company, 1953.*

This book will prove to be a needed adjunct in the teaching of physical diagnosis since for some time emphasis has been placed upon the examination of the chest. Most surgical conditions are covered in the text, and practicing physicians will find it helpful in differentiating surgical lesions. Descriptions of the techniques and procedures to be mastered in surgical diagnosis are detailed and well illustrated. In every section the approach to the examination is presented in such a way as to make the doctor-patient relationship more pleasant and the examination easier.

Each system of the body is considered separately, and there is a special chapter on the examination of the abdomen in infants and children. The last six chapters will be of interest to all physicians in general practice since methods are presented for rapid diagnosis following trauma.

Doctor in the House

RICHARD GORDON. *186 pages. $2.75. New York, Harcourt, Brace and Company, 1953.*

"Doctor in the House" is a fantastic story of an English medical school. It is beyond comprehension for anyone to read the story and see such frivolous young men in medical schools today, regardless of the country.

This book is well written and easy to read, yet the impression one receives of the English medical student is certainly not complimentary, and a person can be happy the student will not be his doctor some day.

[11]*Robert M. Tenery, M. D., Waxahachie.*

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

Clinical Session Attended by 7,716

There were 7,716 persons including 2,730 physicians registered for the seventh annual clinical session of the American Medical Association in St. Louis, December 1-4. In addition to a full scientific program, the meeting included sessions of the House of Delegates in which policy action was taken in a number of areas.

The House adopted a modification of the Principles of Medical Ethics which clarifies the relationship of physicians to all form of public information media and referred to the Board of Trustees a resolution calling for the appointment of a special committee to study the publicity problems which result from unethical practices by a small minority of physicians.

Opposition to compulsory coverage of physicians under federal old age and survivors insurance was voiced again, whereas passage of the Jenkins-Keogh bills to permit a voluntary pension program for the self-employed, of the Bricker amendment to restrict treaty-making powers, and of measures to reduce or remove the limitation on the deduction of medical and dental expenses for income tax purposes was approved. The House voiced strong opposition to extension of the doctor draft beyond the present expiration date of June 30, 1955. A resolution endorsing the principle of federally subsidized scholarships for prospective military personnel was referred to the Trustees.

The Council on Medical Service was requested to proceed at once with special study of problems relating to catastrophic coverage and coverage for retired persons in voluntary health insurance plans. The House again affirmed itself as considering pathology, radiology, anesthesiology, and psychiatry as medical services and condemned insurance contracts which classify any such medical service as hospital service. The Joint Commission on Accreditation of Hospitals was requested to publicize its regulations and interpretations on accreditation.

The House referred to the Judicial Council a resolution from Iowa calling for approval of a joint billing procedure when services are rendered by two or more physicians.

Note was made that the American Medical Association has given a fourth grant of $500,000 to the American Medical Education Foundation. The foundation reported a total income for 1953 of $1,174,000 with the number of contributors more than double that for 1952.

One of the speakers before the House of Delegates was Dr. Chester Keefer of Boston, special assistant to the Secretary of Health, Education, and Welfare in Washington.

Dr. Joseph I. Greenwell, New Haven, Ky., was named General Practitioner of the Year.

NEW AMA TELEVISION FILMS

The American Medical Association's Television Film Library now has available four new television shows to be used exclusively by local medical societies. The films will not be aired on any national television network but have been designed to be presented on public service time locally.

The films are "Operation Herbert," which deals with medical care costs; "A Citizen Participates," which shows a citizen's campaign to get a doctor for the town; "What to Do," which is a series of six five-minute shows demonstrating the use of a thermometer, the application of artificial respiration, the stocking of a medicine chest, and emergency treatment of colds, abdominal pains, and headaches; and "Your Doctor," which describes medical training facilities and focuses on the career of a general practitioner in a rural community.

Prints of these films may be obtained by county societies by writing to the AMA's Television Film Library, 535 North Dearborn Street, Chicago 10.

Education and Licensure Congress Set

The annual Congress on Medical Education and Licensure conducted by the Council on Medical Education and Hospitals of the American Medical Association and the Federation of State Medical Boards of the United States will be held February 8 and 9 in Chicago. An open meeting of the Advisory Board for Medical Specialties will be held the preceding day.

Blasingame Resigns Legislative Job

Dr. F. J. L. Blasingame, Wharton, who has been serving as chairman of the Legislative Committee of the American Medical Association, has resigned from that position because of pressure of other commitments. Dr. Blasingame is a member of the AMA Board of Trustees.

Industrial Health Conference at Louisville

The fourteenth annual Congress on Industrial Health sponsored by the Council on Industrial Health of the American Medical Association will convene February 23-25 at Louisville. The role of industry in the maintenance of the health of the nation, health programs for executives, screening examinations, employment welfare of the handicapped, problems of the small plant operator, preparation for emergencies by plant and community, and the relationship of American medicine with labor and management will be considered.

Rural Health Conference in Dallas

The ninth National Conference on Rural Health sponsored by the Council on Rural Health of the American Medical Association will be held at the Baker Hotel, Dallas, March 4-6. Additional details of this conference will appear in the February JOURNAL.

TEXAS MEDICAL ASSOCIATION

MORE TELEPHONE BROADCASTS

Two telephone broadcasts under the sponsorship of the Council on Medical Education and Hospitals of the Texas Medical Association and available to county medical societies or other interested professional groups have been announced for February 16 and March 9. Both broadcasts will originate at the headquarters building of the Texas Medical Association in Austin.

The February program will be presented by members of the faculty of the University of Texas Medical Branch, Galveston, with Dr. George R. Herrmann as moderator. Dr. Herrmann also will present a discussion on "Recent Advances in Cardiovascular Diseases." Other topics and speakers include "Recent Advances in Endocrinology and Metabolism" by Dr. Raymond L. Gregory; "Recent Advances in Hematology" by Dr. William C. Levin; and "Recent Advances in Gastroenterology" by Dr. Edward J. Lefeber.

The March program, for which Dr. Henry M. Winans will be moderator, will be offered by Dallasites. Topics and speakers will be "Diet in Cardiovascular Disease" by Dr. Donald Seldin; "Diet in Metabolic Disease" by Dr. Edwin L. Rippy; and "Diet in Gastrointestinal Disease" by Dr. Tate Miller.

Local Committees Named

Members of the local committees for the 1954 San Antonio annual session of the Texas Medical Association, which is to be held May 3-5, have been announced by Dr. L. Bonham Jones, chairman of the Committee on General Arrangements. Serving with Dr. Jones on this steering committee are the following physicians, all of San Antonio: Drs. Charles L. McGehee, Edward D. Dumas, John M. Smith, Jr., and Robert R. Nixon. Other committees are as follows:

Alumni.—William D. Montgomery, chairman; G. G. Passmore, University of Texas School of Medicine; C. C. Shotts, Baylor University College of Medicine; J. Walter Park, III, Southwestern Medical School of the University of Texas; James E. Pridgen, Tulane University of Louisiana School of Medicine; William M. Center, University of Arkansas School of Medicine; Mildred E. Ward, Louisiana State University School of Medicine.

Fraternity.—William J. Johnson, Jr., chairman; Edwin M. Sykes, Jr., Alpha Kappa Kappa; James E. L. Reveley, Nu Sigma Nu; S. Perry Post, Phi Beta Pi; James L. Mims, Jr., Phi Chi; John L. Matthews, Phi Rho Sigma; William J. Fetzer, Theta Kappa Psi; R. Bernard Pomerantz, Phi Delta Epsilon.

Halls and Lanterns.—Robert R. Nixon, chairman; John P. Heaney, Vernon S. Wier.

Hotels.—John M. Smith, Jr., chairman; Jack B. Lee, Ralph A. Munslow.

Information.—S. Perry Post, chairman; Benjamin B. Shaver, Pat I. Nixon, Jr.

Memorial Services.—B. F. Stout, chairman; J. L. Cochran, P. I. Nixon.

Publicity.—A. F. Clark, Jr., chairman; O. Roger Hollan, Jack M. Partain.

Scientific Exhibits.—Arthur C. Ressmann, chairman; Lawrence M. Shefts, Frank M. Posey, Jr.

Social.—Joseph W. Palmer, chairman; John C. Parsons, John J. DeLeon, William W. Sawtelle, Robert H. Vadheim, William J. Block, Jr.

Sports (Golf).—John B. Case, chairman; John C. Parsons, Arthur B. Pyterek.

Technical Exhibits.—Carl E. Bosshardt, chairman; Robert F. Gossett, Daniel D. Altgelt.

Transportation.—Adolfo Urrutia, chairman; Walter Walthall, Phillip L. Day.

Executive Council to Meet

As announced previously, the Executive Council of the Texas Medical Association will meet at the Association's building in Austin on January 24, beginning at 8:30 a. m. The preceding day a conference for presidents and secretaries of county medical societies will be held at the same place beginning at 10 a. m.

COUNTY SOCIETIES

Andrews-Ector-Midland Counties Society

October 15, 1953

Will Private Practice of Medicine Survive?—F. J. L. Blasingame, Wharton.

Dr. Blasingame, President-Elect of the Texas Medical Association, was principal speaker at a meeting of the Andrews-Ector-Midland Counties Medical Society October 15 in Midland, to which the Howard-Martin-Glasscock-Borden-Scurry-Kent-Dickens-Garza-King-Stonewall Counties Medical Society was invited. He spoke on the above subject.

Bell County Society

October 7, 1953

(Reported by H. H. Brindley, Secretary)

Mediastinal Tumors—G. V. Brindley, Jr., Temple.

After the business session of the October 7 meeting of the Bell County Medical Society, Dr. Brindley presented the above discussion with picture slide illustrations. John Henderson was co-author of the paper. The meeting was held in Temple.

A letter from Mrs. A. Ford Wolf, Temple, chairman of the local auxiliary's essay contest committee, was read, asking if the society again wanted to sponsor the Association of American Physicians and Surgeons essay contest. It was decided that Bell County would not participate this year.

The problem of venereal disease control was discussed and a report given by Harry Frey, Belton, of a meeting of various officials of Temple and of Bell County and Army officers from Fort Hood. J. H. Johnson, Temple, presented a revised report and recommendations by the public health committee, and the report and recommendations as presented were adopted.

Applications for membership of Frederick J. Fay and W. J. Bruce were accepted unanimously.

December 2, 1953

(Reported by H. H. Brindley, Secretary)

Mechanisms of Pain in Duodenal Ulcer—N. C. Hightower, Temple. Discussion—A. C. Broders, Jr., Temple.

The Bell County Medical Society met in Temple December 2 to hear the above scientific program and to elect officers. New officers are Hanes H. Brindley, president; Joe A. Fowler, vice-president; Fred M. Hammond, secretary; R. R. Curtis, J. B. Talley, and J. W. Pittman, censors; R. A. Murray and James C. Walker, delegates; and R. N. Bartels and Ralph Greenlee, alternate delegates. Dr. Fowler is from Killeen; Dr. Pittman is from Belton; all other officers are from Temple.

Dr. Curtis stressed the importance of the American Medical Education Foundation and the responsibility of the doctors in connection with the foundation.

The society voted to give its secretary's secretary $100 for her assistance to the society during the year.

Bexar County Society

December 8, 1953

(Reported by Catherine P. Chester, Executive Secretary)

The following officers of the Bexar County Medical Society were installed December 8 at the San Antonio Country Club: Merton M. Minter, president; Robert F. Gossett, president-elect; C. W. Tennison, vice-president; O. R. Hollan, secretary; Daniel D. Altgelt, treasurer; Charles L. McGehee, trustee; and E. W. Coyle, censor. J. Lewis Pipkin is delegate and Ralph A. Munslow, alternate. All officers are from San Antonio. Dr. Coyle, outgoing president, was installing officer.

Speaker at the dinner was Mr. C. R. Spearman, president of the San Antonio Chamber of Commerce, who presented an outsider's viewpoint of "A Doctor's Responsibility to His Community." Chairmen of the society's various committees reported on committee activities for the year.

Cameron-Willacy Counties Society

November 16, 1953

(Reported by David F. Nickell, Executive Secretary)

Clinical Significance of Intraglandular Thyroid Carcinoma—William O. Russell, Houston.

The above scientific program was presented in Brownsville at the November 16 meeting of the Cameron-Willacy Counties Medical Society after a social hour and dinner with the society's woman's auxiliary.

The group voted to write notes of thanks to the *Valley Morning Star* and the *Brownsville Herald* for their coverage of Texas Medical Association's one hundredth anniversary and to add copies of the special editions of both papers to the society's permanent records. Members who assisted in the publication of the editions also were thanked.

W. M. Hibbitts, Texarkana, was a guest at the meeting.

December 14, 1953

(Reported by David F. Nickell, Executive Secretary)

After the annual Christmas party of the Cameron-Willacy Counties Medical Society and its auxiliary in Raymondville December 14, the society held a business meeting and elected officers. J. C. George, Brownsville, became president; David F. Nickell, Harlingen, vice-president; Harry A. Miller, Brownsville, secretary-treasurer; Hunter Scales, San Benito, delegate; and Thurman Kinder, Brownsville, censor.

The society voted to pay each year the basic expenses incurred on the delegate's trip to the Texas Medical Association's annual session and also to contribute $150 yearly to the auxiliary's nurse scholarship fund.

Dudley Smith, Harlingen, president, presided over the business meeting, and Charles Spence, Raymondville, acted as master of ceremonies for the dinner party. Marcel Bedri, Harlingen, played a violin solo, accompanied by Mrs. Herbert Strass, Harlingen. Mrs. Martin Atchison, Harlingen, reported on the auxiliary's nurse recruitment program.

Approximately seventy members and their wives attended.

Dallas County Society

November 10, 1953

(Reported by W. W. Fowler, Secretary)

Hope for Control of Carcinoma of Breast—C. D. Haagensen, New York.

The Dallas County Medical Society met November 10 at Dallas. Dr. Haagensen, who is associate professor of surgery at Columbia University College of Physicians and Surgeons, presented the fourth annual Charles M. Rosser Lecture.

Jack G. Kerr, president, then conducted a business session, during which the nominating committee, with Charles L. Martin as chairman, submitted a report.

Ona Mae Austin, Thomas G. Price, and Jerry Culwell were elected to membership; and the society approved the proposal by which the Texas State College for Women, Denton, would take over the school of nursing conducted by Parkland Hospital. Elliott Mendenhall requested that society members renew their subscriptions to *Today's Health* through the local woman's auxiliary.

Gonzales County Society

December 2, 1953

(Reported by James C. Price, Secretary)

The Gonzales County Medical Society met for dinner and a business session December 2 in Gonzales to hear the Texas Medical Association's telephone postgraduate broadcast on "Obstetric Emergencies" and to elect officers. The 1954 officers are Henry S. Edwards, Nixon, president; Walter A. Sievers, Gonzales, vice-president; and James C. Price, Gonzales, secretary.

Grayson County Society

October 13, 1953

Roentgen-Ray Problems—Arthur Boyd, Sherman.
Tumor Clinic—Philip Montgomery, James Martin, Billie L. Aronoff, James Howard, and E. K. Siebel, Dallas.
Case Presentations—Stanley Clayton, T. A. Moorman, and Maurice Weisberg, Denison.

The three-point program outlined above was given at the monthly dinner meeting of the Grayson County Medical Society October 13 at the Woodlawn Country Club in Denison.

Gregg County Society

October 13, 1953

Peptic Ulcer—A. C. Broders, Jr., R. R. White, and A. W. Sommer, Temple.

The above staff members of Scott and White Clinic presented a panel discussion on peptic ulcer at the October 13 meeting of the Gregg County Medical Society in Longview.

Howard-Martin-Glasscock-Borden-Scurry-Kent-Dickens-Garza-King-Stonewall Counties Society

October 27, 1953

Care of Major Head Injuries in General Practice—J. Victor Ellis, Amarillo.

Members of the staff of the Big Spring State Hospital were hosts to the Howard-Martin-Glasscock-Borden-Scurry-Kent-Dickens-Garza-King-Stonewall Counties Medical Society for a dinner meeting October 27 in Big Spring. The above scientific discussion was given, followed by a question and answer period.

Roy Sloan, Big Spring, presided at the dinner session; he introduced guests including James Bethea and Sam Hoerster, Jr., both associated with the Board for Texas State Hospitals and Special Schools, Austin.

The local woman's auxiliary met with the society for dinner, followed by a separate business session.

Lubbock-Crosby Counties Society

November 2, 1953

(Reported by Frank C. Goodwin, Secretary)

Hip Fractures and Prostheses—John J. Hinchey, San Antonio.
Discussion—Richard Lewis, Lubbock; Harry Tubbs, Post; and Charles Ratcliff, Lubbock.

Wallace I. Hess, president, presided over the November 2 meeting of the Lubbock-Crosby Counties Medical Society in Lubbock.

A letter from J. A. Chatman asking the reaction of the medical society to presenting a five-hour scientific program at a forthcoming state meeting of the Lone Star State Medical Association in Lubbock was read, and the society was in favor of the proposal. The society also accepted Dr. Chatman's invitation to hold its December meeting at the Chatman Clinic-Hospital.

It was announced that the revised constitution and bylaws, which had been approved by Mr. Philip Overton, legal counsel for the Texas Medical Association, will be mimeographed and sent to the society members.

The society voted to adopt the recommendation of the executive board to hold an annual banquet after the first of the year to introduce new officers of the society and of the woman's auxiliary and to foster fellowship among the members.

The society endorsed the proposed project of the local chapter of the Texas Heart Association for checking pulse and blood pressure by registered nurses. Upon request of the president of the District 3 Medical Society, the local society voted to sponsor a speaker for the section on obstetrics and gynecology at the next district meeting.

Nominations were made for officers to be elected at the next meeting, and the above scientific program was presented.

Milam County Society

October 13, 1953

(Reported by Marvin H. Bartlett, Secretary)

The Milam County Medical Society met October 13 in Cameron and elected the following officers for 1954: Thomas S. Barkley, Rockdale, president; John T. Richards, Rockdale, vice-president and delegate; and Marvin H. Bartlett, secretary-treasurer, Cameron.

Reeves-Ward-Winkler-Loving-Culberson-Hudspeth Counties Society

October 15, 1953

Common Eye Problems—Willis T. Carson, Odessa.
Tumors of Ear, Nose, and Throat—Jack L. Turner, Odessa.

Following a buffet dinner in Pecos on October 15 with members of the local woman's auxiliary, the Reeves-Ward-Winkler-Loving-Culberson Hudspeth Counties Medical Society held a business session and heard the program outlined above.

San Patricio-Aransas-Refugio Counties Society

December 1, 1953

(Reported by C. A. Selby, President)

Significance of Back Pain—Joseph Platz, Corpus Christi.

After a dinner in Sinton on December 1, the San Patricio-Aransas-Refugio Counties Medical Society heard the above scientific discussion and elected officers for 1954. New officers are Josephine Shelton, Refugio, president; Rose Tunnell, Taft, president-elect; Harry Miller, Refugio, vice-president; Maurice Horine, Ingleside, secretary-treasurer; John H. Finn, Refugio, delegate; and John Tunnell and Y. S. Jenkins, both of Taft, alternate delegates. L. G. Wood, Rockport; T. C. Meitzen, Refugio; and Dr. Jenkins were chosen as censors.

Dr. Selby, retiring president, and C. H. Simpson, both of Sinton, were hosts for the meeting. About twenty-five physicians attended.

Tarrant County Society

December 10, 1953

(Reported by Joseph F. McVeigh, Chairman, Public Relations Committee)

Approximately 200 persons attended the fourth in a series of open forums and panel discussions sponsored by the Tar-

rant County Medical Society on December 10 in the auditorium of the new Fort Worth Academy of Medicine. The subject was allergy, and Sim Hulsey was moderator. Panel speakers were William Flood, dermatologist; O. J. Emery, allergist; D. E. Neal, general practitioner; and Thomas J. Coleman, internist.

Of special interest to persons in Fort Worth was the question of fluoride in connection with allergy, since the city was scheduled to begin putting fluoride into the municipal water supply to prevent tooth decay among children. Dr. Coleman said that fluoridation is a controversial question, but so far as he had been able to determine, the evidence was in favor of fluoride. Fluoride in water is not known to be connected with any allergy, he stated. Dr. Hulsey pointed out that fluoride is similar to chlorine which has been used for years in water supplies.

The next forum was to be on poliomyelitis January 14. The first three forum subjects were menopause, accidents, and the common cold.

Washington-Burleson Counties Society

October 13, 1953

The Washington-Burleson Counties Medical Society met October 13 at the clinic of C. E. Southern in Brenham to hear the telephone postgraduate broadcast on obstetric emergencies. The broadcast was one in a series sponsored by the Texas Medical Association.

Webb-Zapata-Jim Hogg Counties Society

December 1, 1953

(Reported by A. S. McGee, Acting Secretary)

Your Medical Society—Mr. N. C. Forrester, Austin.

The Webb-Zapata-Jim Hogg Counties Medical Society met for dinner and an election of officers in Laredo on December 1. The woman's auxiliary met with the society.

The following officers were elected: V. L. Puig, Jr., president; M. E. Malakoff, vice-president; Paul H. Powell, Jr., secretary-treasurer; E. M. Longoria, delegate; and F. M. Canseco, censor. All new officers are from Laredo.

Mr. Forrester, executive secretary of the Texas Medical Association, discussed the Association's headquarters building and some of the problems that face the medical society today, including legislation, veterans' care, socialized medicine, segregation of white and Negro doctors, the relationship between the pharmacist and the medical doctor, and the nursing shortage. He was introduced by Dr. Malakoff, program chairman, and A. C. King, president, presided.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

December 8, 1953

(Reported by Lorraine I. Stengl, Secretary)

On December 8 the Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society met in El Campo for a Christmas buffet dinner with the local woman's auxiliary and then elected the following officers: C. V. Nichols, Richmond, president; E. B. Sanford, Palacios, vice-president; and Stanley E. Thompson, Richmond, secretary-treasurer. R. G. Johnson, New Gulf, was elected to the board of censors and Joseph Bader, Edna, to the adjudication board. Delegate is L. B. Johnson, El Campo; and Harold Northington, Wharton, and R. G. Johnson are alternates. R. G. Johnson is the legislative representative, and the two new members of the executive board are C. A. Shoultz, Bay City, and Franz Amman, Rosenberg.

DISTRICT SOCIETIES

Tenth District Society

October 3, 1953

Preemployment Examinations in Sabine Area Industries—William R. Thornton, Port Neches.

Industrial Burns and Their Treatment—Elliott B. Hay, Houston.

More Common Industrial Injuries of Bones and Joints—William H. Ainsworth, Galveston.

The semiannual session of the Tenth District Medical Society was held October 3 in Port Arthur, and the above scientific program was presented. Edmund D. Jones, Beaumont, president, presided.

AUXILIARY SECTION

ANNUAL AUXILIARY REPORTS

With little more than three months remaining before the Woman's Auxiliary to the Texas Medical Association holds its annual convention in San Antonio, Auxiliary officers and committee chairmen are being reminded that annual reports soon will be due.

County auxiliary presidents are requested to submit two main types of reports: (1) a statistical report and (2) a narrative report. The statistical report is a tabulation of all auxiliary activities and is made by filling out a blank form which will be sent in February, along with a letter of instruction, to county presidents by Mrs. Paul Brindley of Galveston, State Auxiliary Recording Secretary. "No single auxiliary," Mrs. Brindley points out, "will be expected to answer all questions. Only those pertaining to activities in which the group has participated need be answered." The completed statistical report should be returned to Mrs. Brindley by March 15.

The narrative report, also due March 15, is the basis of each county president's oral report to be given at the state convention. This report becomes a part of the convention transactions, printed yearly in the July issue of the JOURNAL. It is from the narrative reports, too, that the State Auxiliary President, Mrs. E. W. Coyle, obtains information for use in her report to the National Auxiliary.

County presidents are reminded to include mention of any outstanding activities or programs to be held after the report is submitted. "This is the place to let your star shine," says Mrs. Brindley. "Tell about your new projects, parties, or what-have-you, or your new and original way of doing the old jobs common to all auxiliaries. Make it good; make it interesting."

The following instructions for preparing narrative reports are given by Mrs. Brindley:

1. Type and double space the report on 8½ by 11 inch white paper and leave ample margins.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. E. W. Coyle, San Antonio; President-Elect, Mrs. Mark H. Latimer, Houston; First Vice-President (Organization), Mrs. John D. Gleckler, Denison; Second Vice-President (Physical Examinations), Mrs. Cecil O. Patterson, Dallas; Third Vice-President (Today's Health), Mrs. Ralph B. Payne, Amarillo; Fourth Vice-President (Program), Mrs. Guy Knolle, Houston; Recording Secretary, Mrs. Paul Brindley, Galveston; Corresponding Secretary, Mrs. Charles L. McGehee, San Antonio; Treasurer, Mrs. Oscar M. Marchman, Jr., Dallas; Publicity Secretary, Mrs. Allen H. Neighbors, Jr., Austin; Parliamentarian, Mrs. H. S. Renshaw, Fort Worth.

2. Make an original and four clear carbon copies.

3. Send the original and one copy to Mrs. Paul Brindley, Recording Secretary, 4306 Sherman, Galveston; one copy to Mrs. E. W. Coyle, President, 213 Grant Avenue, Alamo Heights, San Antonio; and one copy to Mrs. Travis Smith, Historian, 849 Elmwood Drive, Abilene. Put one copy in the file for the incoming president.

At the 1954 convention, county presidents will be asked to limit their oral reports to two minutes each. Because of this time limit and the space limitations in the JOURNAL, length of narrative reports should be between 200 and 500 words, except in the case of auxiliaries having 100 or more members, which may use up to 1,000 words if necessary.

State officers and committee chairmen and council women also submit narrative reports at the annual convention. Rules and suggestions for preparing these reports are the same as those given for county reports except that the officer and committee reports are due April 1.

To obtain a breakdown on information of special concern to them, certain state officers and committee chairmen request county auxiliaries to send data on particular projects direct to them for use in their reports. The following deadline for these additional reports have been given:

February 1—Mental health survey data. Send to Mrs. A. B. Pumphrey, 100 Pumphrey Drive, Fort Worth.

February 1—Library Fund donations. Send to Mrs. S. F. Harrington, 3722 Cragmont, Dallas.

February 15—Report on number of physical examinations for physicians and families of physicians. Send to Mrs. Cecil O. Patterson, 3537 Southwestern Boulevard, Dallas.

March 1—Report on most interesting meeting of the year for Archives. Send to Mrs. F. F. Kirby, 2801 Sanger Avenue, Waco.

March 10—History of county auxiliary. Send to Mrs. Travis Smith, 849 Elmwood Drive, Abilene.

March 10—First three prize winning essays in AAPS essay contest from each county auxiliary. Send to Texas Medical Association, 1801 Lamar Boulevard, Austin, for judging for state prizes.

April 1—Report on number of *Bulletin* subscriptions sold since May 1, 1953. Send to Mrs. E. H. Marek, Yoakum.

April 30—Report on number of *Today's Health* subscriptions sold. Send to Mrs. Ralph B. Payne, 87 North Avondale, Amarillo.

Mrs. O. M. Marchman, Jr., State Auxiliary Treasurer, has placed in the mail to each county treasurer a letter plus a four-page instruction pamphlet from the National Auxiliary. Dues for former members are being accepted by Mrs. Marchman, 5539 Montrose, Dallas, from January 15 to March 1. New members' dues may be accepted until April 1. Donations to the philanthropic funds (Library, Student Loan, American Medical Education Foundation, and Memorial) go directly to the respective chairmen and are counted in the current year up until the treasurer's books are closed—about April 15. Vouchers from state officers and committee chairmen must be submitted to Mrs. Marchman by March 31.

COUNTY AUXILIARIES

"Medicine and Magic in Childbirth" was reviewed by Mrs. W. Frank Armstrong, Fort Worth, for the November 6 meeting of *Navarro County Auxiliary*. Turning to the latter end of life for its business session, the group voted to remember the aged at "Twilight Home" with Christmas gifts instead of exchanging gifts among its own membership, and a committee was appointed to formulate plans for a more permanent program of assistance to residents of the home. A dessert course was served by Mesdames Leslie Kelton and Bernard Rosen, Corsicana.

Recruitment of high school girls to enter nurses' training was discussed by *Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson Counties Auxiliary* in the home of Mrs. W. W. Brooks, Borger, October 14. Mrs. Claunch Brindley was named chairman of the recruitment committee and Mrs. Larry Hanson, co-chairman; both reside in Borger.

Mrs. E. W. Coyle, San Antonio, President of the Woman's Auxiliary to the Texas Medical Association, was guest speaker at a dinner given by the *Smith County Auxiliary* to honor doctors of the area October 17. Dr. Coyle also was present for the Tyler event. Mrs. Coyle likewise addressed the *Gregg County Auxiliary* at a luncheon meeting October 15 in Kilgore.

Hunt County Auxiliary entertained its medical society at dinner October 13 in the home of Dr. and Mrs. J. W. Ward, Greenville. An original skit under the direction of Mrs. E. T. Crim and piano selections by the daughter of Dr. and Mrs. Grady Bruce entertained guests.

A Christmas party was held by *El Paso County Auxiliary* in El Paso December 14 in connection with a luncheon for which Mesdames Frank O. Barrett and Harry H. Varner were chairmen. Mrs. Haskell D. Hatfield read two original poems, and a cake walk was conducted by Mrs. Russell Deter and Mrs. Joe Carter, cakes, cookies, and candies made and donated by members being prizes for the event. The auxiliary raised funds to help finance its nurse scholarship, nurse recruitment, hospital work, and othet projects.

Tarrant County Auxiliary members and guests learned the art of candlemaking and Christmas decoration at a guest day luncheon December 11 in Fort Worth.

The purposes and function of standing committees were reviewed by the *Harrison County Auxiliary* in Marshall early in October. Members heard from the following chairmen: Mesdames Maurice Murphy, Roger Harmon, Malcolm McNatt, Ray H. Carter, and John E. Hill. Mrs. George Bennett was in charge of the program.

Mrs. D. C. Bennett, Orange, president of the *Orange County Auxiliary*, outlined her plans for the year when the group met for luncheon October 13 in Orange. The main project is to be work for a treatment center for children with cerebral palsy.

October brought social events for the *Galveston, Dallas, Nueces, and Travis Counties Auxiliaries*. A luncheon in Galveston on October 18 honored Mrs. E. W. Coyle, San Antonio, President of the State Auxiliary; Mrs. W. D. Nicholson, Freeport, District 8 council woman; and Dr. Jesse B. Johnson, Galveston, president of the local county medical society. Officers of the Dallas County Auxiliary were honored at a coffee October 7 in Dallas. Honorees included Mrs. Sidney Baird, president; Mrs. Speight Jenkins, immediate past president; Mrs. Robert Sparkman, president-elect; and members of the board. Twelve new members of Nueces County Auxiliary were special guests at a coffee in the home of Mrs. Charles Mella, Corpus Christi. Mrs. Charles Clark was chairman of arrangements with Mrs. Thomas Edwards as co-chairman. The Travis County Auxiliary honored sixteen new members at a coffee October 20 in Austin, at which time W. A. Stiegler, a publisher, reviewed a book of which an auxiliary member, Mrs. Walter Goddard, is co-author.

POLIO MOVIES AVAILABLE

Auxiliary members are urged by Mrs. E. W. Coyle, San Antonio, State Auxiliary President, to take an active part in the 1954 Mothers' March on Polio campaigns currently under way.

Several films have been made available by the National Foundation for Infantile Paralysis for loan to Auxiliary members. They include "Marbles and Lollipops," an account of gamma globulin field tests; "1953 Newsreel," showing

how polio epidemics are fought; and "1954 Mothers' March on Polio," featuring Miss Helen Hayes. All of the films are 16 mm. sound reels running ten minutes each. Information on how to obtain the films may be had by writing to Mrs. Arleen Draker at the Association's central offices in Austin.

Mrs. Coyle is a member of the March of Dimes State Advisory Committee and represented the Auxiliary at the committee's December 12 meeting in Austin.

AUXILIARY DEATHS

Mrs. W. H. Brandau, Beaumont, a former president of the Woman's Auxiliary to the Jefferson County Medical Society, died November 8, 1953, several days after suffering a cerebral hemorrhage. An active civic and social worker, Mrs. Brandau is survived by her husband, her mother, a daughter, a brother, and a granddaughter.

DEATHS

E. H. CARY

Dr. Edward Henry Cary, Dallas, Texas, past president of the Dallas County Medical Society, Texas Medical Association, Southern Medical Association, and American Medical Association and former dean of Baylor University College of Medicine, died December 11, 1953.

A native of Union Springs, Ala., Dr. Cary was born February 28, 1872, the son of Joseph Milton and Lucy Janette (Powell) Cary. He came to Texas as a young man to work with his brother. Later he obtained his medical education in New York, being graduated from Bellevue Hospital Medical College in 1898, interning at Bellevue Hospital, and then serving at the New York Eye and Ear Infirmary, during which time he was chief of the Eye Clinic of Bellevue Dispensary and substitute professor of ophthalmology in New York Polyclinic. Returning to Texas in 1901, Dr. Cary became professor of ophthalmology and otolaryngology and head of the department first at Dallas Medical College and then, when the old school became part of Baylor University, at Baylor University College of Medicine. He also had been dean of Dallas Medical College and was instrumental in arranging for its absorption by Baylor. He immediately was named dean of the new college and served in that capacity from his appointment in 1903 until 1922; from 1929 until 1943 he was dean emeritus. He was chairman of the Department of Surgery from 1921 to 1929, chairman of the faculty from 1909 to 1929, and chairman of the advisory board of Baylor School and Hospital from 1909 to 1929. Under his direction was organized the Baylor Medical and Surgical Unit which served in France during World War I. He was chairman of the district medical advisory board at that time and was a member of the district appeal board of Selective Service during World War II. In 1939 Dr. Cary helped to organize and became president of the Southwestern Medical Foundation, which was designed to support a great medical center in Dallas. Failure to make agreeable arrangements with Baylor University College of Medicine, which soon moved to Houston, did not stop Dr. Cary and his associates, who assisted in establishing Southwestern Medical College in 1943 and have continued support of the latter institution since its inclusion in the University of Texas system.

When Dr. Cary first returned to Texas after completing his medical studies, he took over the management of A. P. Cary surgical supply company which had been founded by his recently deceased brother, and he continued as president of that business. He likewise was president of the Cary-Schneider Investment Company and of the Medical Arts Hospital of Dallas. In 1921 he built the Medical Arts Building, the first skyscraper especially for offices of physicians. He also was president of Group Hospital Service, the Texas affiliate of Blue Cross, which he had helped to launch as a hospital insurance plan for Dallas school teachers. He was president also of the Kessler Plan Association and a director of the Republic National Bank of Dallas.

Dr. Cary found time to practice his specialty of eye, ear, nose, and throat despite his many educational, business, and civic interests and wrote numerous articles in that field. In addition to holding membership in county, state, regional, and national medical associations, he was the first president of the Texas Society of Ophthalmology and Otolaryngology, a member of the American Laryngological, Rhinological, and Otological Society and the American Academy of Ophthalmology and Otolaryngology, and a fellow of the American College of Surgeons. President of the Texas Medical Association for the 1917-1918 term, Dr. Cary was elected to emeritus membership in 1948. He had represented Texas in the House of Delegates of the American Medical Association off and on over a period of forty years and was a trustee of the AMA from 1925 to 1929 before becoming president for 1932-1933, the only AMA president Texas has had. One of the first to recognize the dangers of socialized medicine, Dr. Cary was president of the National Physicians Committee from its inception until the need for its fight against socializing forces brought its liquidation.

DR. E. H. CARY

Dr. Cary was president of the Dallas Historical Society and of the Texas Philosophical Society, and a member of the Masonic Order (a thirty-second degree Mason and member of the Shrine), Phi Alpha Sigma, Alpha Omega Alpha, Society of Colonial Wars, First Families of Virginia, Critics Club, Dallas Athletic Club, Brookhollow Club, and Dallas Country Club.

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

In addition to honoring him with positions of leadership in numerous organizations, Dr. Cary's associates paid more specific tribute to him on several occasions. He was awarded the honorary degree of doctor of laws by Baylor University in 1916. A bronze bust of him was presented to Baylor University in 1929. He was honor guest at a formal dinner given by Dallas County Medical Society, the Woman's Auxiliary to Dallas County Medical Society, the Dallas County Dental Society, and the Kessler Plan Association in 1931 upon his election as President-Elect of the AMA. He was presented the Linz award as Dallas' most outstanding citizen in 1945. He was given another dinner to celebrate his seventy-fifth birthday in 1947, at which time a $20,000 gift was made in his name for scholarships at Southwestern Medical School.

In 1948 a biography of Dr. Cary, "More Than Armies," was written by Booth Mooney. In the introduction, Dr. Morris Fishbein said of Dr. Cary: "This man is a physician, a distinguished scientist, a medical statesman, a great builder, educator, idealist—all combined in the person of one dynamic, driving, courageous and at the same time gentle, friendly and affectionate human being."

Dr. Cary is survived by his wife, the former Miss Georgie Fonda Schneider, whom he married April 19, 1911, in Dallas, the first president of the Woman's Auxiliary to the Texas Medical Association and of the Woman's Auxiliary to the Southern Medical Association. Also surviving are a son, E. H. Cary, Jr., Dallas; three daughters, Mrs. Ogden Brower, North Tarrytown, New York; Mrs. W. L. Carwile, Jr., Oklahoma City; and Mrs. John I. Hill, Houston; a sister, Mrs. Lucile Cary Lowry, Dallas; and a brother, Joseph M. Cary, Houston.

M. L. GRAVES

Dr. Marvin Lee Graves, a former president of the Texas Medical Association, died November 19, 1953, in Houston, Texas.

The son of the Rev. George W. and Mary Priscilla (Fowler) Graves, Dr. Graves was born in Bosqueville, March 26, 1867. Two years before beginning his premedical studies under Dr. H. C. Ghent of Belton, he served as principal of Belton High School. He received a bachelor's degree in 1885 and a master's degree in 1891 from Bellevue Hospital, New York, now a part of New York University. Dr. Graves held honorary degrees from Southern Methodist University, Dallas, and Baylor University College of Medicine, Houston, as well as an honorary doctor of science degree awarded him in 1949 on the 190th anniversary of Southwestern University, Georgetown.

After receiving his medical degree, Dr. Graves moved to Waco where he practiced for seven years before moving to San Antonio to serve as superintendent of Southwestern Hospital for the Insane. In Waco he was physician for the Methodist Orphanage. In 1950, he opened a practice in Galveston and became professor of medicine and nervous and mental diseases at the University of Texas School of Medicine and physician-in-chief at John Sealy Hospital. More recently he has been emeritus professor of medicine at the Medical Branch in Galveston. He practiced in Galveston for twenty years before resigning his professorship and moving to Houston in 1925 to continue private practice. In Houston he was a member of the Methodist Hospital's executive board and later became an honorary member of the hospital staff. Following his retirement in 1949, Dr. Graves became medical adviser to the American General Insurance Company.

Dr. Graves was a member of the American Medical Association and Texas Medical Association through the Harris County Medical Society. A member of the State Association for forty-eight years, he was elected to emeritus membership in 1937. He served as President of the Texas Medical Association for 1913-1914, was a member of the Board of Trustees for ten years, and served as chairman of several scientific sections for Association annual sessions. He had been president of the Houston Society of Internal Medicine, Texas Club of Internists, Texas Association of Life Insurance Medical Directors, and the Texas Heart Association. He was a fellow of the American College of Physicians and a member of the Southern Medical Association. He was a member also

DR. MARVIN L. GRAVES

of the Phi Chi medical fraternity. He was a member for twenty-eight years of the Board of Stewards of the First Methodist Church of Houston, and for twenty-one years before that, held the same office in the First Methodist Church of Galveston. He attended the Methodist Ecumenical Conference in London in 1921. He was a member of the Masonic Lodge, Chamber of Commerce, and Houston Country Club.

In 1893, Dr. Graves married the former Miss Laura Ghent of Belton. In addition to his wife, who served as a president of the Woman's Auxiliary to the Texas Medical Association, he is survived by the following: a son, Dr. Ghent Graves, Houston; two daughters, Mrs. Laura Lee Steel and Mrs. Mary Alice Morse, both of Houston; two sisters, Miss Minnie B. Graves and Mrs. Gladys Stevenson, both of Waco; and five brothers, Newton Graves, Augusta, Ga.; E. F. Graves, Waco; and Judge George Graves, Ralf Graves, D.D.S., and P. F. Graves, all of Houston.

J. S. BUIE

Dr. James Shaw Buie, Mertens, Texas, died November 11, 1953, in a Waco hospital of coronary heart disease.

Born March 1, 1879, near Brandon, Hill County, Texas, the son of Dr. Whitefield and Julia (Shaw) Buie, Dr. Buie attended the old Southwestern University Medical College in Dallas, where he received his medical degree in 1904. He then interned at St. Paul's Hospital in Dallas. Dr. Buie practiced in Hill County for thirty years, moving from Brandon to Hillsboro and later to Mertens. For thirteen years he was connected with the Texas State Hospital system, working at Terrell, Rusk, Austin, and Mexia. While in Mexia he was

with the Mexia State School and Home. Dr. Buie became a member of the staff of the Central Oklahoma State Hospital, Norman, Okla., in 1951. In 1953, he retired from this position and returned to his home in Mertens, where he lived until his death.

Dr. Buie was a member of the American Medical Association and Texas Medical Association through Hill County Medical Society, and also of the Texas Academy of General Practice. He was a member of the Mertens Masonic Lodge and the Presbyterian Church.

DR. J. S. BUIE

Dr. Buie married Miss Ethel Cooper in 1906. His first wife preceded him in death in 1941. In 1945, he married the former Mrs. Georgia Pearl Elliott. She and the following survive him: a daughter, Miss Mary Frances Buie of Terrell; two sisters, Mrs. Julia Mae Wilhelm of San Antonio and Mrs. Margaret P. Williams of Terrell; two nephews, Willie S. Williams of South Houston and Judge Sterling Williams of Snyder.

H. D. KEARBY

Dr. Harold Donald Kearby died November 21, 1953, at Houston, Texas, of coronary infarction.

Dr. Kearby was born September 27, 1909, at Helena, Mo., the son of Dr. Howard Denton and Verda Eva Kearby. He attended St. Joseph Junior College, St. Joseph, Mo.; the University of Missouri, Columbia; and the University of Arkansas, Fayetteville, and received his medical degree from the University of Arkansas School of Medicine, Little Rock, in 1938. After interning at St. Margaret's Hospital, Kansas City, Kan., and serving a residency in urology at the Turner Urological Institute, Houston, Dr. Kearby specialized in urology at Houston until he entered the United States Air Force in 1951. A major, he had served as chief of urology at Lackland Air Force Base, San Antonio, and as head of the department of urology at the largest Air Force hospital in the Far East. He was recently discharged from the Air Force and had returned to Houston.

Dr. Kearby was a member of the American Medical Association and Texas Medical Association through Harris County Medical Society. He also held membership in the Postgraduate Medical Assembly of South Texas, South Central Section of the American Urological Association, Texas Urological Society, Phi Beta Pi medical fraternity, and Woodmen of the World, and was a member of the Baptist Church.

Dr. Kearby is survived by his wife, the former Miss Geraldine Arnold, whom he married July 30, 1934, in Lawrence, Kans., and his grandmother, Mrs. Belle Holland of St. Joseph, Mo.

J. H. BROWN

Dr. Joseph Hyal Brown died October 19, 1953, in Fort Worth, Texas, after suffering a heart attack.

Dr. Brown was born in Hillsboro, July 9, 1901. He received his academic education at Texas Agricultural and Mechanical College, College Station; Texas Christian University, Fort Worth; and Tulane University of Louisiana, New Orleans. He was graduated in medicine from Tulane University in 1930, and served his internship at St. Joseph's Infirmary in Fort Worth.

Dr. Brown was division surgeon for Rock Island Lines and Southern Pacific Lines and was in general practice, being associated for some years with his father-in-law, Dr. Will C. Duringer. He was a current member of the American Medical Association through Tarrant County Medical Society.

Survivors include his wife, the former Miss Dorothy Duringer; a 2½ year old daughter, Dorothy Duringer Brown; and his mother, Mrs. Maud A. Brown, all of Fort Worth.

J. A. RIEBEL

Dr. John Alan Riebel, Kingsville, Texas, died September 12, 1953, in that city.

Born in Columbus, Ohio, August 29, 1907, Dr. Riebel, whose father, brother, and uncle also were physicians, received his education at Ohio State University and the University's College of Medicine, Columbus, from which he was graduated with a medical degree in 1934. He interned at the White Cross Hospital in Columbus, after which he entered private practice in Columbus and later with his uncle practiced in Ashland, Ohio, where he remained until he joined the Medical Corps of the United States Army Air Force in 1941. During his five years in the service, Dr. Riebel was a flight surgeon in England and Africa and was stationed in Texas twice. He returned to private practice in Ashland until 1949, when he became chief surgeon at the United States Veterans Administration Hospital in Lexington, Ky. He moved to Kingsville in 1952. He was a general practitioner and a surgeon.

A member of the American Medical Association and the Texas Medical Association through the Kleberg-Kenedy Counties Medical Society, Dr. Riebel formerly had been a member of the Ohio State Medical Association. He belonged to the Presbyterian Church.

Dr. Riebel's wife and two daughters, Dawn Riebel and Dusk Riebel, survive.

F. L. ROBBINS

Dr. Frank Leonard Robbins, Baytown, Texas, died November 18, 1953.

Born in Freelandville, Ind., May 29, 1881, the son of Mr. and Mrs. Thomas Robbins, Dr. Robbins received his preliminary education in Vincennes University, Vincennes, Ind. He attended Louisville Medical College, where he was graduated in 1906. Dr. Robbins externed at Good Samaritan Hospital, Lexington, Ky., in 1905. He practiced in Carlisle, Ind., for eleven years, Goose Creek, Texas, for thirty-seven years, and Baytown from 1944 until his death. He was city health officer at Goose Creek and head of the Welfare Clinic of Baytown for several years.

Dr. Robbins was a member of the American Medical Association and Texas Medical Association through Harris County

Medical Society, and of the Houston Academy of Medicine. In 1952, he was elected to honorary membership in the Texas Medical Association. While practicing in Indiana, he belonged to the Sullivan County Medical Society. Dr. Robbins was a captain in the Medical Corps of the American Expeditionary Force during World War I. He was a charter member of the Baytown Rotary Club, a Mason, and a member of the Episcopal Church.

In 1909 Dr. Robbins married the former Miss Lena M. Grizzle in Carlisle, Ind. His wife survives as do two sons, Philip L. Robbins and Ruel H. Robbins, both of New Iberia, La., and a daughter, Miss Helen M. Robbins, Baytown.

F. S. REASONOVER

Dr. Farley Straughn Reasonover, Grand Prairie, Texas, died at the home of his parents in Dallas on October 25, 1953, as the result of an accident.

He was born to Mr. and Mrs. Farley Reasonover in Denison on February 27, 1926. Dr. Reasonover acquired his preliminary education at Highland Park High School, from which he was graduated with honors; Oklahoma Agricultural and Mechanical College, Stillwater; the University of California at Los Angeles; and the University of California, Berkeley. After his graduation from Southwestern Medical

DR. FARLEY S. REASONOVER

School of the University of Texas in June, 1952, Dr. Reasonover served an internship in Baylor Hospital. He had begun the practice of medicine in Grand Prairie this past July.

During World War II Dr. Reasonover received Army basic training at Camp Wolters, Texas, and was affiliated with the Eighty-Fifth Mountain Infantry Regiment and the Tenth Mountain Ski Troops. He was a medical clerk. During nine months' overseas duty he took part in the Italian campaign and was awarded a bronze star citation.

A member of the American and Texas Medical Associations through Dallas County Medical Society, Dr. Reasonover was a member of Phi Chi medical fraternity, the National Honor Society, and Alpha Tau Omega fraternity. He was affiliated with the Methodist Church.

Survivors are his parents, Mr. and Mrs. Farley Reasonover, Dallas.

G. L. CARLISLE

Dr. George Lawson Carlisle, Dallas, Texas, died of coronary occlusion in his home November 2, 1953.

Dr. Carlisle was born September 7, 1891, in Jackson, Miss., to George W. and Virginia (Fearn) Carlisle. He attended Dallas High School and Millsaps College in Jackson and was graduated in 1914 from Southern Methodist University Medical Department, Dallas. After internships at St. Paul's Hospital, Dallas, and St. Mary's Infirmary, Galveston, Dr. Carlisle was a resident in cardiology at Massachusetts General Hospital, Boston. Since 1915 he had practiced in Dallas with the exception of two years' military service as first lieutenant in the United States Army during World War I. Certified by the American Board of Internal Medicine, Dr. Carlisle was particularly interested in heart diseases.

The problem of lay health education was one to which Dr. Carlisle devoted a great amount of effort. As George Lawson, M. D., he was co-author with his wife, Helen Parker, R. N., of a health column "Your Health" which appeared thrice weekly in the woman's section of the Dallas *News*. For a time he also conducted a program on medical topics over a Dallas radio station, KRLD, and he wrote a book for general practitioners entitled "Practical Talks on Heart Diseases." Dr. Carlisle earned a reputation as a phi-

DR. GEORGE LAWSON CARLISLE

losopher as well as a scientist. His interest in the patient as a person and his understanding of sick people's problems, which were evident in his writings, earned for him a patient's comment that he was a "modern adaptation of the old-fashioned family physician."

A member for thirty-eight years of the Texas and American Medical Associations, Dr. Carlisle in 1927 served as president of the Dallas County Medical Society. He was a member as well of the Dallas Southern Clinical Society, Dallas Academy of Internal Medicine, and Texas and American Heart Associations. Dr. Carlisle was professor of physical diagnosis at Baylor University College of Medicine while it was located in Dallas and taught at Southwestern Medical School of the University of Texas, being a consultant in medicine there at the time of his death. He had contributed numerous scientific papers to national medical journals. In

1945 he was president of Baylor University Hospital staff. He was a member of Theta Kappa Psi medical fraternity and Pi Kappa Alpha fraternity and was affiliated with the Methodist Church.

Dr. Carlisle married Miss Mildred King in Dallas in 1915; their children, Mrs. Donald Gay, Dallas, and George L. Carlisle, Jr., Austin, and two grandchildren survive. Also surviving are a second wife, the former Miss Helen Parker, whom he wed January 16, 1949, in Dallas; and three brothers, Hugh P. Carlisle, G. Fern Carlisle, and John B. Carlisle, all of Dallas.

C. C. CARRICO

Dr. Carl C. Carrico, Houston, Texas, died in a Houston hospital September 7, 1953, of cerebral thrombosis.

Born August 30, 1901, in Dallas, the son of the late B. J. and Effie Mae Carrico, Dr. Carrico attended the University of Texas, Austin, and was graduated in 1928 from Baylor University College of Medicine, then in Dallas. After interning at Gorgas Hospital, Panama Canal Zone, he practiced at Scott and White Clinic, Temple, and served for a year at Huntsville as a hospital physician for the Texas Prison System. He then moved to Houston, where he was the physician for the Post Office for eleven years and a general practitioner until his death, with the exception of

DR. CARL C. CARRICO

the period between 1941 and 1946, during which time he was a captain in the United States Army Medical Corps and was chief of the communicable disease section of the Harmon General Hospital at Longview. With the Forty-Fifth Infantry Division, Dr. Carrico participated in the invasions of Sicily and Salerno and the Anzio beachhead. He was a favorite of the late Ernie Pyle, who referred to Dr. Carrico in news dispatches and later in his book, "Brave Men," as "the red-headed doctor." Dr. Carrico was on the staffs of St. Joseph's Infirmary and Methodist and Hermann Hospitals in Houston.

Elected to honorary membership in the Texas Medical Association through the Harris County Medical Society in 1950, Dr. Carrico was a member of the American Medical Association, Southern Medical Association, Postgraduate Medical Assembly of South Texas, Texas Academy of General Practice, and the American Academy of General Practice. He also belonged to the American Legion, Elks, and National Association of Retired Civil Service Employees.

Dr. Carrico married Miss Helen M. Murphy on August 4, 1934, in Denison. She survives him as do a son, Carl C. Carrico II, and a daughter, Miss Carolynn Murphy Carrico, both of Houston, and a sister, Mrs. J. K. Wilson, Los Angeles.

E. W. LOOMIS

Dr. Edgar Webb Loomis died November 18, 1953, at a Dallas, Texas, hospital.

Born in Dallas, February 21, 1886, he was graduated from the University of the South, Sewanee, Tenn., and received his medical degree from Southwestern University Medical College, Dallas, in 1910. After graduation, he served in Alaska as a medical missionary for the Episcopal Church. Upon his return to Dallas in 1912, he became assistant city health officer and later director of the Health Department. He resigned his post to accept a commission in the Medical Corps of the United States Army during World War I and served two and one-half years in France as a major. He returned to Dallas and his health department office after the war but resigned again in 1922 to begin private general practice. Several years later Dr. Loomis took special work at the Babies Hospital and Bellevue Hospital in New York and limited his practice to diseases of infants and children when he returned to Texas. One of the first Dallas doctors to specialize in pediatrics, he was admitted to the American Academy of Pediatrics in 1934 and was certified by the American Board of Pediatrics.

DR. EDGAR W. LOOMIS

Dr. Loomis was a member of the American Medical Association and Texas Medical Association through Dallas County Medical Society. He belonged to the Episcopal Church and Hella Temple Shrine.

His wife, the former Miss Addie Jane Walker of Quanah, whom he married on March 15, 1922, died February 21, 1936.

Surviving Dr. Loomis are three daughters, Mrs. J. P. Butler and Mrs. R. E. Collier, both of Dallas, and Mrs. C. R. Bryant of College Station; two brothers, Richard F. Loomis and John S. Loomis, both of Dallas; and four granddaughters.

President's Page

POLITICAL BACKGROUND FOR NATIONAL HEALTH PLANNING

The background upon which the present federal government policy concerning health planning is based is found in the political trend toward social liberalism during the past twenty years. In all fields of endeavor an ever expanding governmental invasion of private enterprise has made Uncle Sam the individual's greatest competitor. This invasion has been accomplished through an aggressive network of federal corporations. These corporations, rooted in many years of creeping socialism, now engage in competition with private enterprise in hundreds of classifications of business, industry, and commerce without regard for operation losses because these can be made up by taxing their competitor—the private citizen.

These enterprises are carried on by an intricate maze of federal agencies which is now said to contain some 2,500 bureaus which serve as a screen for gigantic federal corporations. These exist without constitutional authority or justification. Mr. Willis Stone has pointed out that "under the pretense of regulating commerce, the various administrations of government have gradually passed more and more legislation permitting bureaus of the government to compete actively with private industry; consequently the original intent of various sections of the constitution designed to protect us have been circumvented." There is an incessant clamor for more power, more capital, and more bureaus.

The movement toward this type of executive government began with the so-called "brain trusters" early in the Roosevelt era, and has continued to grow bigger and more powerful with the passing years. Now, the influence and pressure of this socializing group has grown so much bigger and more powerful than either political party that there is a coalition of party policies in matters regarding more government spending and more giving of what is called services and benefits. The only difference in party politics visible to the taxpayer now is a row among politicians as to which party is going to build an already overstuffed government bigger.

Ex-President Herbert Hoover said at Cleveland, Ohio, April 11, 1953, that "it is false liberalism that expresses itself by federal opera-

tion of business in competition with the citizen." It has been pointed out that 40 per cent of the land and 20 per cent of the industrial capacity of the United States is federally owned and operated. Eighty-three government corporations compete with private enterprise on a rent-free, cost-free, and tax-free basis. The reaction of the overtaxed and overcontrolled citizen to this type of perpetuated government is found in the proposed twenty-third constitutional amendment, proposed income tax lid law, and the Bricker amendment.

The twenty-third amendment provides that "the government of the United States shall not engage in any business, professional, commercial, financial or industrial competition with its citizens except as specified in the Constitution." This amendment is a practical method of returning the ownership of America back to American citizens who built and one time owned it. The effect of carrying this governmental formula into practice is simple and clear because it specifies only that the Constitution be followed and that circumventing practices will not be tolerated.

The now not too popular proposal among politicians to put a 25 per cent lid on income tax remains from the standpoint of the American citizen a protection against overtaxation. This proposed legislation provides for a constitutional amendment prohibiting the federal government from collecting more than 25 per cent of any individual's income as an income tax during any calendar year provided there is no existing national emergency.

The Bricker amendment as it concerns us provides constitutional protection against the socialization of medicine through the treaty-making power now vested in the President of the United States. The alarming thought is the possibility that in this era of statism and reform-by-treaty urge the United States might enter into treaties which would make effective the socialization of medicine.

The movement toward governmental controls is much broader than the field of medicine alone, and we must enlist and work with other affected groups of citizens if our efforts in the control of legislation are to be fruitful.

George Tierney M.D.

TPR diagnotes

REPORT OF PUBLIC RELATIONS COMMITTEE: Third annual meeting for county society presidents and secretaries held in Austin on January 23 with heavy attendance. County officers heard reports covering operation of Texas Medical Association's key boards, councils, and committees plus the latest report on Veterans' medical care from national viewpoint. Speakers on VA panel included Dr. Frank E. Wilson, director, AMA's Washington office, together with Dr. Everett C. Fox, Dallas, and Dr. F. J. L. Blasingame, Wharton.

Hospitality room downtown well attended. Displays showed visiting presidents and secretaries PR projects, plus brochures and services available to county societies.

The 1954 Presidents' and Secretaries' Handbook completed and distributed at meeting. It contains information invaluable to county societies ranging from duties of officers to congressional district maps and table of headquarters organization. Available on request.

PR Committee reported excellent reception of year's Medical Students' Day programs to Board of Trustees, recommending format for 1954. New procedure incorporates same material, more stress and time per topic.

PR recommendation on ways to bring in more attendance at annual session presented to Board of Trustees and received approval. Plan makes use of concentrated direct mail publicity.

Committee reported that results of doctor distribution test survey complete in District 7 reveal two general conclusions: either District 7 is not representative of communities statewide or community need of doctors is not as pressing as some critics of the profession would have the public believe.

ON THE NATIONAL SCENE: New horizons in field of undergraduate and post-graduate medical education were opened as California Medical Association establishes subsidiary, nonprofit corporation called the Audio-Digest Foundation. Through a system of tape recordings and synchronized visual slides or film strips, current medical literature and lectures will be summarized and distributed to doctors throughout the world. Taking the profession's outstanding teachers to the doctor practicing in rural or isolated areas will allow him to keep abreast of medicine's rapid scientific advances and at the same time continue home care for his patients.

The Eisenhower administration has recommended a reinsurance program of $25,000,000. AMA has adopted a wait and see tentative approval - think it might turn into a subsidy.

Hearings on insurance now scheduled by the House Interstate and Foreign Commerce Committee. Committee is looking into all phases of prepay plans, including catastrophic illness insurance, and hearing selected representatives from AMA, cooperative health plans, labor, Blue Cross and Blue Shield, Health Information Foundation, Committee for Economic Security, and others.

Dallas is now set to play host to Ninth National Conference on Rural Health, March 4 through 6. Meeting's theme - "Let's Put More U in CommUNITY." Predict large attendance, excellent opportunity to cement relations between doctor and rural layman.

OVER THE STATE: Eighteenth Annual International Medical Assembly held in San Antonio January 26 through 28. Many physicians heard scientific papers delivered by sixteen guest speakers from all over the United States and from as far away as Canada.

Woman's Auxiliary Handbook nearing completion - should be ready for distribution by March 1. Book contains pertinent information for county auxiliaries.

The Woman's Auxiliary to Harris County Medical Society has collected for bombed-out and looted medical schools in South Korea, 4,000 medical periodicals and 500 medical textbooks. Touching commendation came from Dr. Kook H. Koo, South Korean doctor in Houston for a year's scholarship.

Interest mounting for Texas Medical Association annual session to be held May 3, 4, and 5 in San Antonio. The importance of this key meeting should be stressed at county society level, all members urged to attend.

UNIFIED APPROACH TO GOOD WILL

When the county medical society presidents and secretaries held their third annual meeting in Austin January 23 and sat in on the Executive Council meeting the next day, they heard reviewed the function of each council and committee of the Texas Medical Association. Knowing the organization not only means a better operating society but is the first step in the direction of a strong internal public relations program. And as Dr. T. C. Terrell, Fort Worth, wrote in the February, 1953, President's Page, ". . . a better understanding of our own organization and its facilities will help in developing more fruitful external public relations, too. Without being able to tell other people about the Association and its services and without making use of those services in helping to build good will, the problem of creating pleasant relations with the public is made harder." To work together as a closely knit group, county society members must be informed as to policies and programs, must attend and take an active interest in their local meetings, and must avoid professional jealousy and unwarranted criticism of fellow physicians.

To help prepare future doctors to take their place alongside older members of the medical profession, Medical Students' Day programs have been held this school year at the three medical teaching institutions in Texas. The programs, sponsored jointly by the Association and the Dallas, Harris, and Galveston Counties Medical Societies and presenting indoctrination talks by some of the key men in the state's medical organizations, were so successful in acquainting medical students with the practical features of their future medical practice that they are to be continued annually.

Regardless of how well each member of an organization, young or old, knows its program and joins in it, the public will not be favorably impressed unless the program is inherently good. The Association's 1954 program, while emphasizing internal relations, also makes note of the four points stressed last year in an effort to present a positive public relations program of value to patients and public.

Mediation committees have been and are being established by most of the county medical

societies as one of the medical profession's answers to public criticism alleging the high cost of medical care.

Another point provides for around-the-clock emergency medical service, recommending the establishment of county society telephone panels guaranteeing the provision of a physician in an emergency at any hour.

A special effort is being made to learn of the areas of physician shortage and to assist in the remedy of such shortages.

The fourth point is designed to make doctors' offices more efficient, friendlier, and incidentally more profitable by properly training medical secretaries and clerical assistants. The Association's Committee on Public Relations has prepared and released several thousand kits outlining proper secretary training and is continuing to offer help in this field to individual doctors and county societies.

A well planned and executed joint program is of the utmost importance, but organization alone cannot do the job. Public relations is the personal responsibility of individual physicians, and not until each physician does his share can maximum success be obtained. A physician's actions reflect on the entire profession, and his deeds add to or detract from the prestige shared by medical men the world over.

PART OF THE ANSWER

One of the chief cries of opponents of the medical profession and apologies of some of its friends has been "doctor shortage." Knowing that the only way to answer adequately the challenge posed by this phrase, the Texas Medical Association some months ago determined to find out exactly what situation exists in Texas and to do something to correct maladjustments if sizable gaps in physician care exist. At least a partial answer now is available.

The whole question was turned over to a special Committee on Doctor Distribution, composed of persons already familiar with the problems of rural health, medical economics, and public relations. With one statewide survey complete and another finished in one district and ready for expansion into other areas, the committee has at hand a reservoir of important facts which had been guessed at or unknown previously. For example, the doctors of Texas, more than 6,000 of whom answered a questionnaire, think that additional general practitioners are needed, especially in communities of less than 5,000 population and in northwest Texas. In Texas as a whole the average is 1 physician per 813 population as compared with 1 physician per 730 population nationwide. Calls any hour of the day will be taken by 87 per cent of all general practitioners and by 62 per cent of all specialists. In District 7, the pilot area for a survey of opinion among community lay leaders, not a single community of more than 800 population complained of insufficient physicians. These facts and others already obtained or to be obtained by the Committee on Doctor Distribution will be invaluable in answering legitimate claims for help and misguided complaints from whatever source.

Since World War II, the Texas Medical Association has made a concerted effort to assist communities in need of physicians to obtain them. The Physicians Placement Service, operated in the central offices under the direction of the Council on Medical Economics, will continue to work closely with the Committee on Doctor Distribution to assist areas which should have additional physicians. This Placement Service recently has received recognition nationally for the service it is performing, not only for communities searching for doctors but for doctors attempting to establish practice in new locations.

Doctor distribution and health care as it affects the rural population, the spot at which most irritation occurs because of "doctor shortage," will be considered at length at the national Rural Health Conference to be spon-

sored by the American Medical Association in Dallas in March. Farmers, home demonstration agents, visiting nurses, and a wide variety of persons interested directly and indirectly in the promotion of better health will be present for the session in Dallas. With Texas the host state, more Texans than usual should attend this conference, and the exchange of information and opinion there should help in establishing a better understanding of the part which any community must play to assure for itself adequate health care and also of the aid which the medical profession is ready to provide. Physicians in attendance undoubtedly will get new insight into the life of rural people and will be more capable of accepting their role in the solution of mutual problems.

Possession of facts about doctor distribution, an aggressive program to place physicians where they are most needed, and establishment of liaison with lay leaders sharing a concern for better health give promise of creating not only a finer medical service but also a happier climate of public opinion.

CEREBRAL PALSY DATA SOUGHT

Help in obtaining authoritative information about the number of cerebral palsied patients in Texas and what facilities are available and needed for their treatment and training will be asked of physicians of the state within the next few weeks.

A voluntary committee of William G. Wolfe, Ph. D., director of special education in the Department of Educational Psychology at the University of Texas, Austin, chairman; Dr. Lewis M. Helfer, San Antonio; Dr. Ralph Hanna, Austin; and Leon Reed, graduate student in special education at the University of Texas, Austin, serving without pay, is administering a $10,000 grant from United Cerebral Palsy of Texas. A one year survey now beginning will be the first statewide study to ascertain just how big the cerebral palsy problem is and how it best can be met.

Doctors will be sent a simple form asking for the name, address, and birthdate of any cerebral palsy patients they have had. When this information is returned, the doctors will not be asked to spend more time on the survey; instead, parents, hospitals, and clinics will be asked to supply additional details. All information will be used for statistical purposes; individual case records will be kept confidential. The results of the survey will be generally available.

Cooperation with this survey may mean the compilation of data invaluable in the care of cerebral palsied patients.

Age in Medical School

As a group, older students are more likely to drop out without finishing medical school than are their younger companions, according to a study of the relationship between the ages at time of admission to Southwestern Medical School, Dallas, of students who were graduated and those who were not. A report of the study, conducted by Dr. Carmen Miller of the Department of Psychiatry at Southwestern and Dr. Don P. Morris, formerly of Southwestern and now professor of psychiatry and mental health at the University of Illinois, appeared in the January issue of the *Journal of Medical Education*.

Results show that a greater percentage of those who withdrew were in an older age group, suggesting that special care should be exercised by medical schools when considering the admission of older students.

Suggested explanations of the relationship between chronological age and success in medical school include the following: older students may not be as healthy physically; they may be dissatisfied more frequently with the work to a degree to cause illness; more are married and have financial burdens; they have more social obligations, making it difficult to keep up with school work; more of them were indecisive about entering medical school and lack real motivation; many have tried other fields and cannot adjust psychologically elsewhere or in medical school; many wish to take advantage of the GI bill and are not sufficiently motivated; certain intellectual abilities decline with age and disuse; and many older students have been away from the school situation for a period of time.

World Directory of Medical Schools

The first world directory of medical schools, listing more than 500 medical teaching institutions and giving essential data about each, has been issued by the World Health Organization. Of the 84 countries and territories listed as having medical schools, the United States has the most, 79. Next in order come Russia with 61, Japan 46, India 34, United Kingdom 27, France 25, and Italy 21.

GASTRIC CANCER
A Problem of the Internist

MANDRED W. COMFORT, M.D., Rochester, Minnesota

GASTRIC cancer is one of the challenging problems facing the medical profession. It is challenging because its management is far from successful. It is challenging because morbidity and mortality are staggering. Gastric cancer alone accounts for almost 15 per cent of the more than 200,000 deaths estimated to be the annual total of all deaths from cancer.[29] The statement that 1 out of every 200 patients who register at the Mayo Clinic has a gastric cancer always has brought home to me, as no other statistics have, the size and importance of the gastric cancer problem. This statement will undoubtedly interest others because the incidence of gastric cancer probably is not greatly different in other private practices. Such a problem invites continuing and critical review of the methods employed in its management.

Stimulating progress, nevertheless, has been made in the management of gastric cancer. Forty years ago it was the picture of advanced, inoperable gastric cancer with which the medical profession was familiar. A study by Berkson, Walters, Gray, and Priestley of mortality and survival among patients with gastric cancer seen at the Mayo Clinic between 1907 and 1916 disclosed that 60 per cent of the patients with this disease were subjected to laparotomy and only 22 per cent were found to have resectable lesions; 19 per cent survived resection, 7 per cent surviving for three years and 5 per cent for five years or more. Today the outlook has changed. Many more early lesions are being seen, as a similar study[5] of patients encountered between 1940 and 1949 disclosed. Of patients seen in these years, 80 per cent were subjected to laparotomy and 44 per cent to gastric resection; 40 per cent survived resection, 18 per cent surviving for three years and 14 per cent for five or more years. The statistical procedure whereby it is possible to know on January 1, 1951, the five-year survival rate among a group of patients, some of whom were seen as late as the end of 1949, is explained in a paper by Berkson and Gage.

Regarding the material from another statistical point of view gives a better idea of the improvement over the years than can be derived directly from the quantities given in the foregoing paragraph. In the earlier of the periods designated in the preceding paragraph, the operability rate was 60 per 100 patients on whom the diagnosis was made, and in the later of the two periods, it was 80 per 100, an improvement of 33 per cent. For the same periods other statistics were encouraging: resectability rate, 37 per 100 patients operated on as against 55 (improvement 48 per cent); hospital mortality rate, 16 per 100 patients subjected to operation as against 8* (improvement 100 per cent); three-year survival rate, 39 per 100 patients who underwent resection as against 43 (improvement 10 per cent); five-year survival rate, 29 per 100 patients with resection as against 35 (improvement 20 per cent).

To improved surgical technique much of these more favorable results may be attributed, but earlier diagnosis, improved preoperative and postoperative care, better anesthesia, the sulfonamide drugs, the antibiotics, and perhaps other factors have contributed. Gastric cancer clearly may be classified as a curable disease.

These data present the good side of the outlook today. To present the other side, it must be said that of the later group of patients, 20 per cent had hopelessly inoperable lesions on admission; that although 80 per cent underwent exploratory surgery, 36 per cent did not have resectable lesions; and that of the 44 per cent who had resectable lesions, 68 per cent died within five years of operation. Moreover, it is important to note that survival rates did not increase in proportion to resectability rates. Unquestionably there is room for improvement. Wherein does this lie? Many approaches have been suggested. These may be discussed under some such headings as prevention, early diagnosis, new and improved methods of diagnosis, and new and more effective methods of therapy.

PREVENTION

Heredity and environment play a role in the genesis of certain human cancers,[18] but the importance of these factors in the etiology of gastric cancer remains to be proved. Families in which gastric cancer apparently occurs with a frequency greater than in the general population occasionally are seen, but such families have not been well documented as have families subject to breast cancer. Carcinogenic agents, both

**Mortality rate, of course, improves when it is reduced.*

physical and chemical, have been sought in man's food. Klein and Palmer raised the question of the importance of heat in esophageal and gastric cancer of man, because as pointed out by Lerche, carcinomas of these structures tend to predominate in regions just proximal to points of narrowing as do cicatricial strictures of these organs owing to ingestion of corrosive fluid. Gastritis, presumably a precancerous lesion, has been ascribed to food too hot or too cold, and it has been postulated that carcinogens are produced in the food by overheating of cooking oil and fats. However, experimentalists to date have failed to produce adenocarcinoma of the glandular stomach (the part comparable anatomically with the human stomach) of the rat or mouse by such physical and chemical agents orally administered, even after destruction of the mucous barrier[19] suspected of preventing their action, or for that matter by orally administered carcinogenic hydrocarbons of known potency.[3] Neither clinical nor experimental data at present justify screening of all members of the family in which gastric cancer appears (except the rare but frankly cancer-prone family) or the studied alteration of eating or working habits. A preventive approach to gastric cancer has not been found.

EARLIER DIAGNOSIS

Berkson, Walters, Gray, and Priestley's study of mortality and survival in gastric cancer disclosed that, while only about 1 per cent of patients who were subjected only to explorative or palliative operation lived five years, about 32 per cent of those who underwent resection lived this period of time; and while only about 20 per cent of those whose cancers had undergone metastasis lived five years after resection, about 50 per cent of those who did not have recognizable metastatic growths lived this period of time after resection. These data clearly imply that the earlier the lesion reaches the surgeon the higher the survival rate and that the kernel of the problem of increasing survival rates lies in getting more patients into the hands of the surgeon not only while the growth is resectable but before metastasis occurs. In other words, diagnosis must be made earlier than has been possible in the years gone by.

Early diagnosis of gastric cancer is difficult. It is difficult because early symptoms are mild and readily attributable to allergy, food intolerance, and functional disturbances; because the cancer may be superimposed on long-existing functional or organic dyspepsia; and because cancer may be advanced before symptoms appear. Nevertheless, early diagnosis should be possible more frequently if it has not been delayed by self-medication, erroneous interpretation of symptoms, and inaccurate diagnosis.

Early diagnosis may be accomplished in several ways, and the most important of these is education. The public can be educated to seek the physician for careful evaluation of all dyspepsia soon after onset and for yearly examinations. The physician can be urged to remain alert to the possible significance of dyspepsia or loss of weight, especially in those of cancer age, and to the need for promptly localizing the lesion responsible for dyspepsia. To him the point may be stressed that any gastric lesion may be malignant and that it should be treated nonsurgically for only a short time at most; that cancer of the stomach is not a hopeless situation, as the quoted data so well show; and that early exploration is advisable when there is doubt about the nature of the problem. Chairs of oncology currently being established in medical and dental schools will contribute importantly. They serve to increase the students' awareness of the disease, to present current knowledge of, and improve services to, the cancer patient, and to stimulate interest in cancer research. Cancer detection clinics likewise have an educational function. They serve to educate the public and alert the medical profession as well as to detect the cancerous and precancerous lesion.

Earlier diagnosis also may be achieved by frequent routine examinations for cancer. The more enthusiastic advocates of this method propose screening of the general population as is done for pulmonary tuberculosis and are encouraging the development of x-ray equipment and technique suitable for mass screening. The magnitude of the difficulties involved in, and the present impracticability of, such screening are apparent. The development of an easily performed blood test for cancer, one of great selectivity and reliability, appeals to many as a far more practical means of mass screening. Less enthusiastic advocates of screening methods propose screening only those segments of the population in which gastric cancer is more likely to develop than in the general population. These segments are composed of those with achlorhydria, pernicious anemia, and atrophic gastritis.

The assumption that gastric cancer is more likely to develop in persons with achlorhydria than in those with normal gastric acidity rests on the fact of the development of achlorhydria before gastric cancer in a large number of cases[8] and on the achlorhydric character of the gastric content after cancer develops in roughly 60 per cent of cases. Similarly, the assumption that gastric cancer is more likely to develop in the patient with pernicious anemia than in other persons lies in the recorded evidence that the incidence of gastric cancer and of the adenomatous gastric polyp[12, 25, 30, 33, 34] is greater among patients with pernicious anemia than among that portion of the general population which comes to necropsy. Evidence that the patient with atrophic gastritis, but without

pernicious anemia, is likewise especially liable to development of gastric cancer is less convincing, but the presence of achlorhydria in many cases of gastric cancer, together with frequent occurrence of atrophic gastritis in association with gastric cancer,[17, 41, 44] supports such a belief.

Roentgen-ray examinations of those persons within the cancer age whose gastric contents are achlorhydric, at intervals short enough to detect gastric cancer early, should alter significantly the five-year survival rate. It has been estimated[11] that there are 7 to 9 million or more people past the age of 40 years who have achlorhydria, that the incidence of gastric cancer in this group is eight to ten times greater than in the general population, and that about 50 per cent of gastric cancers should develop in persons of this group. Operation of a program of early detection of gastric cancer such as has been mentioned might be considered successful if the percentage of resectable lesions and the five-year survival rate among patients with resectable lesions were increased by 50 per cent. Attractive as the plan may be, the magnitude of the problem of accurately examining roentgenologically so many people renders it impracticable, at least with present methods of examination. Early diagnosis by screening is an idea sound enough to encourage the individual physician to screen some of his own patients by choosing those with low gastric secretory activity, and especially those with pernicious anemia and atrophic gastritis, for careful periodic observation.

The close relationship of two other conditions to gastric cancer requires critical management by the physician. The first of these is the adenomatous gastric polyp. It not uncommonly occurs in the same stomach with cancer, and as many as 35 per cent of polyps have been found cancerous.[28] In a recent study of 185 cases of pathologically verified adenomatous polyps made by Cromer, Butt, and me, the polyp was benign in 150 cases and malignant in 35 (about 19 per cent). The adenomatous gastric polyp justifiably is considered a precursor of gastric cancer and removal is indicated. The second of the two conditions is the benign appearing gastric ulcer. After long years of sometimes bitter debate the question of malignant degeneration of the benign gastric ulcer remains unsettled. The answer to this question is an important one, but from the practical clinical standpoint it is more important to have answers to two other questions. First, is the ulcerating lesion benign or malignant when first seen? And, second, is cancer likely to develop in stomachs diseased by benign gastric ulcer?

Regarding the first question, it is generally accepted that reliable clinical and roentgenologic criteria for prompt distinction between the small benign and malignant lesion do not exist (the meniscus sign—indicative of malignancy—properly interpreted is an exception to this statement). Even in the best of hands, from 10 to 20 per cent of benign-appearing ulcers have been found malignant on microscopic examination.[1, 14, 16, 24, 27, 40, 43]

As to the second question, certain data presented by Cain, Jordan, Gray, and me at least make us loath to deny that gastric cancer may develop in the stomach diseased from gastric ulcer. In a study of 414 patients whose small gastric ulcers had been medically treated, 226 were alive at the end of five years and had not undergone operation. Of these 226, 11 subsequently were found to have cancer. In 7 of the 11 patients, the diagnosis of cancer was proved by examination of tissue removed surgically or at necropsy. In these 11 cases it was difficult to believe that the gastric lesion was cancerous when first seen five or more years previous to the diagnosis of cancer, and it appeared that the cancer developed either in the ulcer or in the mucosa of the stomach diseased by gastric ulcer and at a rate far higher than that at which cancer develops in the general population (estimated rate 0.1 per cent). Because of such an incidence of gastric cancer among benign-appearing gastric lesions and such an incidence of gastric cancer appearing after years of medical treatment, it is difficult to take a casual attitude toward possible gastric malignancy in the patient with gastric ulcer. Prompt, complete, and permanent healing should be the criterion for continued nonsurgical management. The responsibility assumed by the physician who elects to prolong nonsurgical treatment of a gastric lesion that does not respond promptly when gastric resection is available at a mortality rate as low as 1 to 2 per cent has been emphasized repeatedly.

NEW DIAGNOSTIC METHODS

The mainstay in diagnosis of the intragastric neoplasm is the roentgenologic method. Its effectiveness is great. It will disclose a high percentage of the lesions, even small ones. However, in all frankness it should be said that its effectiveness naturally depends on the skill of the roentgenologist. Moreover, in all fairness in evaluating the method, one should remember that even in the hands of the most skilled persons, only lesions gross enough to be visible to the naked eye or extensive enough to produce recognizable rigidity and deformity of the gastric wall would be expected to cast shadows of diagnostic importance. Again, the roentgenologist not only has difficulty in visualizing a lesion but in distinguishing between the benign and the malignant lesion. It is important that the clinician be aware of the limitations of roentgenologic diagnosis, supplement roentgenologic diagnosis

with keen clinical judgment, and use to the fullest, supplementary methods, including surgical exploration when doubt persists.

Recognition of the limitations of roentgenologic diagnosis has led to search for, and appraisal of, methods more sensitive and more accurate than the roentgenologic method. These are many. Gastroscopic examination, which is of proved value in visualizing small gastric lesions, often fails in those cases in which the roentgenologic method likewise may fail, that is, when the lesion is in the cardiac portion or on the posterior wall of the stomach and when the infiltrative lesion is covered by a normal-appearing mucosa. Cytologic study of gastric washings[6, 39, 42] has not yielded satisfactory results to date, but perhaps variations of the methods now being proposed will make it a valuable aid. The use of papain[35] to dissolve mucus and increase the concentration of cells in the preparation to be examined or the employment of an abrasive balloon to remove the cells from the lesion itself[9, 31] are two more recent variations. Smears of the esophagus and cardia, obtained through the esophagoscope, have yielded valuable information.[2] Measurement of the differences in electropotential between the mucosa of the stomach and the skin is currently under study; it has been stated that the differences in potential in cases of cancer are unlike those in cases of ulcer,[15, 37, 38] but these differences may be attributable to variations in gastric acidity.[32] Rovelstad, Owen, and Magath have contributed to the understanding of the pitfalls of the method. Serologic methods, such as those proposed by Huggins and his co-workers[20-23] and investigated by Ellerbrook and his co-workers, as yet have failed to provide specificity or reliability to warrant their use to detect cancer in the stomach or elsewhere. The potential value of all such blood tests is so great that careful appraisal always is urgent.

New and more accurate methods of diagnosis are desirable but may be important only in proportion to the frequency with which gastric cancer gets into the clinician's hands early in the course of the disease.

NEW TREATMENT

Surgical removal of adenocarcinoma of the stomach is the sole therapeutic method of value in treatment of this disease. The increase in resectability and the decrease in surgical mortality rates are convincing evidences of the improvement taking place in application of this method. Roentgen therapy is of value in treatment of gastric lymphosarcoma. The high percentage of gastric cancers which reach the surgeon after the disease has spread beyond the stomach and a five-year survival rate of only 14 per cent point to the need for methods of therapy applicable to cases in which metastasis has taken place. Their discovery may await more fundamental knowledge of the cause of cancer.

COMMENT AND SUMMARY

A gratifying improvement in the outlook for the patient with gastric cancer has taken place in the past thirty years. It is a curable disease even with methods of therapy now applied. The surgeon has done a superb job and may be counted on for further technical progress. The increasing frequency with which total gastrectomy is being done for gastric cancer presages a further increase in resectability, but it remains to be seen whether increased survival rates will compensate for the large numbers of ensuing nutritional and dumping problems.

The gastric cancer patient, however, has not received full advantage of surgical therapy as now practiced. Slightly less than half of such patients are subjected to gastric resection, and of those who are subjected to it, about two-thirds die within five years. Even though resectable, the growth too often already has spread beyond the stomach into the neighboring nodes or organs. Without resorting to the more extensive surgical procedures, greater resectability and survival rates may be achieved by early and accurate diagnosis and institution of treatment before metastasis has occurred.

Critical appraisal of many of the problems involved in shortening the period between onset of the disease and diagnosis followed by surgical removal, together with the improvement in survival rates, suggests a program that should be attended by accomplishment to a gratifying degree. The program is fourfold:

1. The public will be informed that gastric cancer is a curable disease; that it is curable in proportion to the rapidity with which the patient reaches the surgeon and effective treatment is carried out; that certain symptoms indicative of gastric cancer require him to seek immediate and intelligent advice; and that self-medication may cause fatal delay.

2. The physician will be more alert than ever to the possibility of development of gastric and other cancer in patients entrusted to his care, particularly those with achlorhydria, pernicious anemia, and atrophic gastritis; properly conscious of the limitations of present methods of diagnosis, including roentgenologic diagnosis; fully aware of the potentiality of cancer in every intragastric lesion, even in a benign-appearing ulcer; fully aware of the danger of delay in dealing decisively with such a lesion; and convinced of the advisability of early surgical exploration in doubtful cases.

LIBRARY OF THE
COLLEGE OF PHYSICIANS
OF PHILADELPHIA

3. Newer methods of diagnosis and skill in their application will be sought constantly.

4. Support will be given laboratory research into the basic nature of cancer and clinical research into the behavior of cancer, for from these researches will come the needed newer and more accurate methods of diagnosis and therapy.

Further advances in surgical technique probably will increase survival rates as they have in the past, but major dependence should be placed on diagnosis and surgical removal of a larger percentage of gastric cancers earlier in the course of the disease than is now done. In the successful operation of the aforementioned program, which is pointed toward early diagnosis, the physician—general practitioner and internist—will play a major role. It is he who will be most effective in education of the public, who will suspect and diagnose gastric cancer early in its course, who will direct the patient promptly to the surgeon, and who will secure for the patient the full benefits of today's surgical skill.

ABSTRACT OF DISCUSSION

DR. MILFORD O. ROUSE, Dallas: We are indebted to Dr. Comfort for forcefully emphasizing the part played by the diagnostician—general practitioner, internist, or other physician—in improving the admittedly low salvage rate in patients with gastric cancer. At times it would seem almost that the public is more alert than is the medical profession. As Heller has said, we need to "evolve a sensibly cancer-conscious public mind—not a dangerously cancerophobic public." The great need is to find and to utilize effectively means to shorten the time between the onset of the condition, its diagnosis, and the initiation of treatment.

The tragedy of stomach cancer has three important components:

The first is the insidious, nonspecific onset of symptoms. In many instances the first real signs are of advanced disease. Unfortunately there are really no "early signs" of stomach cancer. Observations in cases coming to a second laparotomy where cancer recurs after a gastric resection would indicate a rather slow growth of gastric neoplasm in many instances. In most reports, six months is given as the average time from the probable start of a stomach cancer to the appearance of acknowledged symptoms. In an interesting paper by Cooper, "Patients, Physicians, and Gastric Cancer," in *The Journal of the American Medical Association* of October 18, 1952 (listed in Dr. Comfort's bibliography), a study at the New York Hospital brings out several unique observations on the "time schedule" of stomach carcinoma.

One must admit, regretfully, that at the present time there is woefully little the practicing physician can do to reduce this component. With optimism we may look forward to the future when research will produce a specific or universal diagnostic test which will mean to the cancer problem what the Wassermann test meant to syphilis and mass chest roentgen-ray surveys to pulmonary tuberculosis.

The second component is procrastination by too busy or indifferent patients. The active business man or the busy housewife tries home remedies first, then those suggested by well-meaning friends or the convenient corner druggist, until eventually increasing pain, vomiting, or gastric hemorrhage galvanizes such a person into tardily seeking a physician.

There are definite things to be done in reducing this component, mainly in sensible education of the public. The American Cancer Society has led in this endeavor for years. Practicing physicians should consider it part of their civic responsibility to speak on cancer to service clubs, parent-teacher associations, and women's groups and to make every use possible of access to radio and television programs. The women of the medical auxiliary cooperate splendidly. Modern health education through the health museum technique is worthy of widespread use. Physicians should beam all such education to the end of placing in the mind of the public the fact that cancer is curable when detected and treated sufficiently early. Such education can do much to remove the cancerphobia that makes miserable the lives of countless thousands who have heard just enough about cancer to make them thoroughly uneasy.

The third component of the tragedy of gastric cancer is the doctors' lack of suspicion and delay in establishing a diagnosis. Every patient with a digestive complaint has a right to expect that the physician whom he consults has the training, the intelligence, and a sufficiently acute suspicion of cancer to work out correctly the basis of trouble. We physicians have to be careful lest our commendable desire to bring all hope possible to fearful patients may make us optimists apparently hesitant to consider the possibility of such a grave condition as stomach cancer. Perhaps the press of too heavy a patient-load may make a physician slow to evaluate properly symptoms which should call for an immediate, intensive diagnostic study, which should be repeated if the findings are negative and the symptoms continue. The minimum responsibility of a doctor is to explain and recommend to his patient proper diagnostic procedures, especially roentgen-ray study, stool examination, and gastric analysis with gastroscopy where indicated. Failure to urge such a comprehensive study makes a physician *particeps criminis* if later a far-advanced stomach cancer is found.

We have to admit to ourselves that the existence of the three components mentioned is resulting in many, many unnecessary, preventable deaths. The solution rests in every physician's keeping uppermost in his diagnostic horizon the ever present possibility of cancer of the stomach in a patient with any digestive complaints.

CRIPPLED CHILDREN IN VALLEY GIVEN HOSPITAL

The Earl C. Sams Foundation has promised approximately $300,000 to erect a 50-bed center for the care and treatment of poliomyelitis victims and children crippled by disease and accident in the Lower Rio Grande Valley, the Harlingen *Press* reports. The Children's Center will be a part of the new Valley Baptist Hospital to be erected in Harlingen through the joint efforts of the Baptist General Convention of Texas and the people in the Rio Grande Valley.

The foundation was established by the late Earl Corder Sams, former president of the J. C. Penney Company, who with Mrs. Sams annually spent a month or more in Brownsville with their daughters, Mesdames Dean Porter and Larry Lightner. Mr. and Mrs. Porter and Mr. and Mrs. Lightner are trustees of the foundation.

MASSIVE HEMORRHAGE FROM THE UPPER GASTROINTESTINAL TRACT

Surgical Management

JAMES E. THOMPSON,* M.D., New York, New York

THE most common cause of massive hemorrhage from the upper gastrointestinal tract is peptic ulcer. It is the purpose of this paper to outline experiences in surgical management of this condition at the Roosevelt Hospital since 1946. During the six years from January 1, 1947, to December 31, 1952, there were 323 patients admitted to the hospital suffering from bleeding peptic ulcer. Of these, 174 were classified as hemorrhaging massively (table 1). This paper deals with this group, those whose lives were threatened by the extent of the hemorrhage. The main emphasis is placed on the emergency surgical treatment of this group, not only because it represents a radical departure from our former treatment, but also to add the report of our experiences to those of others.

TABLE 1.—*Hemorrhage from Peptic Ulcer at Roosevelt Hospital, 1940-1945 and 1947-1952.*

Type of Hemorrhage	No. Cases 1940-1945	No. Cases 1947-1952
Simple bleeding	97	149
Massive hemorrhage	50	174
Totals	147	323

The period 1940-1945 comprises only medically treated cases. The discrepancy in totals of the two six-year periods is explained by the fact that Roosevelt Hospital has a busy ambulance and emergency room service for which patients are accepted or transferred at the discretion of the resident physician and that during the 1947-1952 period the resident surgeons were actively interested in this type of patient.

Of the total number of patients with massive hemorrhage admitted to the surgical service in the indicated period, 85 were submitted to emergency surgery, while 40 were treated conservatively until bleeding had ceased and then underwent an elective or delayed operation (table 2). The remainder (49 cases) were treated conservatively, and all but the 4 patients in this group who died, ceased to bleed and were discharged from the hospital. Eight of these patients were readmitted later and underwent elective gastrectomy.

TABLE 2.—*Survival After Massive Hemorrhage from the Upper Gastrointestinal Tract, 1947-1952.*

Treatment	No. Cases	No. Deaths
Emergency operation	85	7
Elective operation	40	2
Conservative (nonoperative)	49	4
Totals	174	13

We did not have facilities to do blood volume determinations on these patients, so that other factors were relied upon in classifying them as massive bleeders. These criteria included visible evidence of the quantity of blood in vomitus or stool, rapidity of pulse, blood pressure, red blood cell count, hemoglobin determination, and hematocrit level. We found that a rapid pulse was the most consistent finding in those who had recently bled massively and was the most valuable indicator of recurrent bleeding. The blood pressure was unreliable at times because a fair percentage of our patients had hypertension, and we rarely had knowledge of the blood pressure levels they previously had maintained. The blood count and hemaglobin readings in some cases were completely misleading due to the extent of hemoconcentration and therefore could not be used as a reliable index to the extent of blood loss. In a few instances gross massive hemorrhage occurred after admission of the patient and the blood work-up which already had been performed was not repeated before proceeding with the operation. It is important to emphasize that not all of the massively bleeding patients had a blood pressure below 90 systolic or a red blood cell count below 2,500,000. In all instances, however, it was considered that life was threatened by the extent of blood loss.

It might be of interest to review the events which led us to abandon extreme conservatism in the management of severely bleeding peptic ulcer. At the Roosevelt Hospital until 1946, patients suffering from massive hemorrhage from the upper gastrointestinal tract were routinely admitted to the medical services. The medical management entailed cautious blood replacement and alternate trials with various types of dietary regimens. This was a procedure commonly followed in similar institutions all over the country. A surgical consultation was rarely requested at the onset of bleeding, and when the invitation came, it was usually as a last resort. The typical patient seen by the surgeon had ceased bleeding shortly after admission, only to suffer recurrent hemorrhage at intervals. He was slipping away in spite of repeated blood replacement and obviously would die unless the source of bleeding could be controlled. He was no fit

**Chief of Surgical Service, Roosevelt Hospital.*

risk for surgery of the magnitude necessary to accomplish this objective.

This situation well illustrates the weakness of the surgical approach existing at that time. The surgical efforts to control massive hemorrhage in any of its stages were then so ineffective that a forbidding mortality resulted from their employment.

This was the status of our therapy until 1946. A surgical consultation occasionally was requested, but surgery rarely was attempted. The surgical literature at this time was beginning to rekindle interest in the subject and twice, once in 1945 and again early in 1946, we operated upon 2 patients who had been bleeding many days from duodenal ulcers. Both died; we believe they could have been saved had we followed the routine used today. The discussion aroused by these 2 deaths was responsible for the formulation of a plan of management that was employed in our hospital during the latter part of 1946 and put into effect on both surgical services beginning in 1947.

It was recognized by us at this time that after repetitions of blood depletion and replacement, a point is reached at which a patient cannot be relied upon to have the necessary recuperative powers to survive even though he is able to withstand the shock of operation. Accordingly it was arranged to have admitted to the surgical service all patients who were hemorrhaging from the upper gastrointestinal tract. The responsibility in this fashion was placed upon the surgeon to decide which patient was a candidate for operation and when it should be performed. On these two decisions lies either the success or failure of the surgical treatment of hemorrhage. We are more and more convinced that there are certain general rules to be followed but that they must not be too rigid.

MANAGEMENT

The patient or other source of information is carefully questioned as to the quantity and character of blood lost by vomitus or stool. Other important items of the history concern any story of indigestion or previous roentgen examinations that might indicate the existence of peptic ulcer. A hypertensive patient who knows the usual level of his blood pressure also can be helpful in an evaluation of the tension at the time of admission. Complete blood count, hematocrit, and blood urea nitrogen determinations are obtained.

Although blood in the intestinal tract may produce excessive blood urea nitrogen,[6] the levels shown in figure 1 indicate that clinically an elevation above 50 mg. per 100 cc. can be expected in only 10 per cent of the cases. The work of Gregory and others[4] has shown that prolonged drops of blood pressure into the shock levels will affect renal function and result in marked increases in the blood urea nitrogen. A reading above 50 mg. per 100 cc. therefore should be considered of serious import and, except under the most urgent circumstances, should be considered a reason for delaying operation until the patient's renal and cardiac status can be evaluated accurately. Some of these patients have hypertension with already established nephrosclerosis and thus represent poor risks for the added surgical trauma. In others the effect on renal function as shown at the time of admission may be secondary to a sustained drop in blood pressure into the shock levels. Such an effect on the kidney may have taken similar toll on myocardial nourishment, with the combination adding materially to the handicaps against the patient (cases 1 and 7). If more attention is paid to the fact that an elevated blood urea nitrogen level at the time of admission is of serious prognostic significance, we are sure the mortality can be lowered.

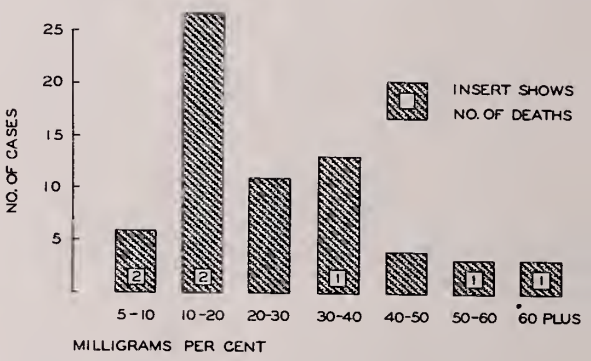

FIG. 1. Preoperative blood urea nitrogen determinations in 67 of 85 patients subjected to emergency gastrectomy for massive hemorrhage at Roosevelt Hospital, 1947-1952.

Following the taking of a careful history, nasogastric suction is commenced by placing a Levine tube in the stomach. It presents visible evidence of persistent or recurrent bleeding, and by removing gastric juices it seems to promote hemostasis. We never hesitate to order a swallow of diluted barium mixture to rule out esophageal varices if the patient gives a negative or doubtful history of ulcer. Great care is exerted to obtain this fluoroscopic and roentgen-ray examination with the least possible exertion on the part of the patient. In none of our cases was it harmful, and in many it has changed a doubtful to a positive diagnosis. A few patients, not included in this series, were shown to have esophageal varices and so avoided operation.

Transfusions of whole blood are commenced immediately. The amount given prior to operation has varied from 1 to 6 liters, depending upon the degree of depletion. Only occasionally has a patient in our group received more than 3 liters prior to operation.

If more was needed, the balance was given on the operating table.

INDICATIONS FOR SURGERY

We have no rigid rules by which to determine the patient who is to be submitted to surgery. A patient who has suffered previous hemorrhages of equal severity presents a strong indication for surgery, but

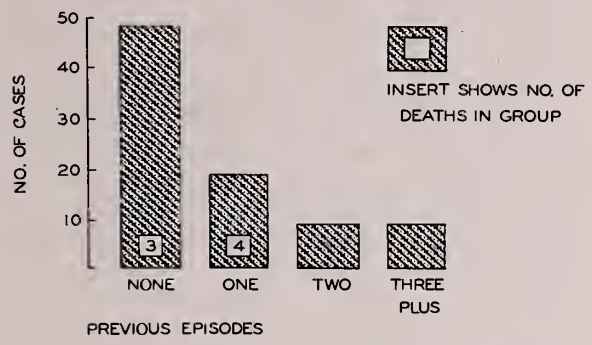

FIG. 2. Episodes of bleeding previous to the hospital admission for emergency gastrectomy for massive hemorrhage in 85 cases, 1947-1952.

this is not a necessary prerequisite. Of our 85 patients subjected to emergency gastrectomy 48 were experiencing their first hemorrhage (fig. 2) and 3 of these died. It had been our earlier misfortune to have patients succumb to fatal hemorrhage on the initial occasion and without the benefit of surgery. Age is definitely a factor, but never a limiting one (fig. 3). Our youngest patient was 22, and the oldest 81, but the majority were in the 40 to 60 year age group. It

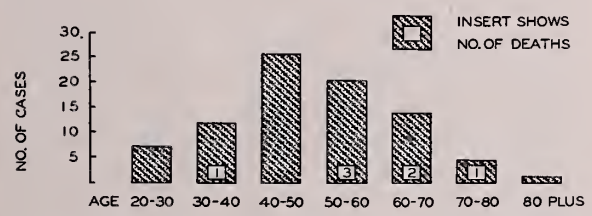

FIG. 3. Age incidence and related mortality in 85 cases of emergency gastrectomy for massive hemorrhage, 1947-1952. The only death in a patient less than 50 years of age occurred in the 1 total gastrectomy performed in this series (case 4).

is as great a mistake to rely upon the physiologic processes of youth to stop bleeding from an ulcer crater as it is to assume that an octogenarian cannot withstand emergency surgery.

We believe that the following are valid criteria for the employment of surgery:

1. Continued evidence of massive bleeding in spite of conservative measures.

2. Recurrent massive hemorrhage after a quiescent interval of hours or days.

3. Evidence of continuous oozing from an ulcer that makes it difficult to maintain normal blood levels by transfusion.

In general, we try to make our decision concerning surgery within seventy-two hours after admission of the patient, believing that delay beyond this period becomes dangerous procrastination. The poorest risk for surgical interference is the patient who has been bleeding for days or weeks and who has had his blood replaced time and again.

Contraindications for emergency surgery are the following:

1. Bleeding of doubtful origin.

2. Bleeding from esophageal varices.

3. Prompt cessation of hemorrhage under conservative management.

4. Admission blood urea nitrogen readings of 50 mg. per 100 cc. or above.

5. The presence of other serious disease, including hemophilia, which in itself would contraindicate surgery.

Many of the patients who presented contraindications to early surgery have had gastrectomy as an elective procedure. Elective operation has been performed during the same hospital admission when the patient has become a better risk or at a subsequent admission.

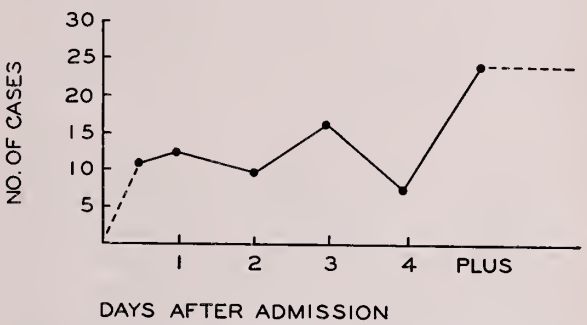

FIG. 4. Lapse of time between admission to the hospital and surgery in 85 cases of emergency gastrectomy for massive hemorrhage, 1947-1952.

The cases reported in this series come from two surgical services, and the operations either were performed or supervised by 18 attending surgeons. In spite of the rather large number of surgeons involved, the technique and surgical approach has been fundamentally similar. It is recognized that many of these patients bleed from an ulcer that cannot be seen or palpated through the walls of the duodenum or stomach. This fact has led us in such instances to employ exploratory gastrotomy which, as Amendola[2] recommends, may commence high in the fundus and extend well down into the duodenum. A more conservative gastrotomy incision is particularly useful in emptying the stomach of copious clots before attempting resection. Where esophageal varices or bleeding from

the lower duodenum and high jejunum were ruled out, we performed partial gastrectomy in all but 2 instances. In reviewing these 2 cases, in which the surgery was limited to a gastrotomy, one wonders if the surgeon was justified in the decision against performing a gastrectomy. This thought is expressed because in some of the gastrectomies the source of bleeding was discovered by the surgeon only after the stomach had been removed or subsequently it was shown by the pathologist to have arisen from a small previously undetected ulcer or from multiple gastric erosions. In the 2 cases negative by virtue of the gastrotomy, there still exists the possibility that a small acute ulcer or microscopic gastric erosion was present in the remaining fundus.

It is for this reason that one should not depend completely upon the gastrotomy incision to rule out the necessity for gastrectomy when inspection of the stomach lining fails to reveal the bleeding point. The rugal folds in the main body of the stomach often hide superficial ulcers that may not be discovered until the removed specimen is washed under a water tap.

The main values of a gastrotomy incision are (1) to rule out the presence of esophageal varices; (2) to note the presence or absence of fresh or old blood in the stomach; (3) temporarily to transfix actively bleeding ulcers; and (4) on rare occasions in the presence of high gastric ulcers, to aid in deciding the exact level of resection.

It would be unwise to recommend blind resection as a routine procedure because of the occasional case of bleeding from esophageal varices that cannot be detected without a gastrotomy. A stronger objection is the possible establishment of a principle that in inexperienced hands might lead to needless surgery.

When examination of the removed stomach specimen and careful scrutiny of the open duodenal stump fails to demonstrate the source of bleeding, the remaining fundus should be examined carefully. This of course means an open anastomosis. Following these principles, one can expect to find the lesion in practically every case (table 3). One must never overlook the rare possibility that the site of hemorrhage might be from a low lying duodenal ulcer, a lesion of the papilla of Vater, or an aneurysm communicating with the third part of the duodenum.

TABLE 3.—*Source of Bleeding in 85 Cases of Emergency Gastrectomy for Massive Hemorrhage, 1947-1952.*

Source of Bleeding	No. Cases
Duodenal ulcer	55
Gastric ulcer	22
Gastrojejunal ulcer	3
Gastric erosions	3
Carcinoma of stomach	1
Unknown	1

The type of gastrectomy employed has been uniformly the anterior Polya procedure with the Hoffmeister modification, placing the proximal loop of the jejunum to the lesser curvature, the operation ascribed to Von Eiselsberg. The amount of stomach removed varied from 65 to 75 per cent. In 1 case a total gastrectomy was performed on the erroneous impression that an ulcer high on the lesser curvature was carcinomatous. In this 32 year old woman the ulcer had perforated into the lesser omental sac and there was a copious amount of blood free in the general peritoneal cavity. The patient subsequently died (case 4).

We have not resorted to palliative surgery such as multiple artery ligations, local excisions of bleeding gastric ulcer, or any local, definitive hemostatic suturing of the ulcer base. It is thought that this type of operation is completely inadequate although artery ligation may be a useful adjunct during a gastrectomy.

TECHNIQUE

The ease with which these patients have tolerated the operative procedure has been a source of surprise and gratification. Adequate blood replacement is the major factor in this success. If necessary, blood should be given into two extremities from the start of the procedure, and it is recommended that a polyethylene tube be placed into a vein in the lower extremity preliminary to bringing the patient to the operating room. Once the blood supply to the stomach is ligated, and just prior to the actual removal of the organ, the active bleeding in the ulcer will cease as a rule. The case presenting an erect stump of artery in an ulcer base is often observed by the operator through a preliminary gastrotomy incision, and here transfixion of the bleeding point as a preliminary adjunct to definitive surgery is of value. Occasionally the bleeding gastroduodenal artery is buried so deeply in the scar tissue of the ulcer that it cannot be isolated until the later stages of the gastrectomy. In this insance it may be necessary to do a pylorotomy and temporarily control the bleeding before proceeding with the gastrectomy.

A drain is almost routinely placed down to the duodenal stump and usually brought out through a right upper quadrant stab wound. The method of abdominal wall closure varies considerably, the most popular being a layer closure with interrupted chromic gut. In addition there are inserted closely placed stay sutures that include all layers but the peritoneum. On occasion only closely spaced interrupted stay sutures of silk or wire are used to include all layers of the abdominal wall in the closure. In a few, wire sutures are similarly used, buried against the fascia but not including the skin. In our cases, it

cannot be said that any of these forms of closure have provided complete insurance against disruption.

The Levine tube is left in the resected stomach and continuous suction applied. The usual practice is to remove the tube when the material aspirated from the stomach either is clear bile or no longer shows evidence of old blood. This occurs from twelve to thirty-six hours after operation. Once the Levine tube has been removed it is wise to have it reinserted at twelve hour intervals (morning and evening) to estimate and remove the residual gastric contents. Once the residue is below 100 cc., this procedure of "bailing out" the stomach is no longer desirable.

In contrast to the ease with which these patients withstand the trauma of operation, the postoperative course has been hazardous as compared to the recovery period following elective gastrectomy. Notably frequent among the complications encountered has been wound disruption. It occurred in 8 cases (table 4). This high incidence is explained on the basis of

TABLE 4.—*Major Complications in 85 Cases of Emergency Gastrectomy for Massive Hemorrhage, 1947-1952.*

Complication	No. Cases	Deaths
Wound disruption	8	
Small bowel obstruction	4	
Pneumonia	4	
Duodenal fistula	3	
Pancreatic fistula	2	
Coronary occlusion	2	1
Uremia	2	2
Thrombophlebitis	3	
Postoperative wound hemorrhage (hemophilia)	1	1
Cardiac arrest (at operation for complication)	2	2

blood loss and protein imbalance. We have discovered no preventive for it and it continues to cause serious concern. It was a factor in 2 deaths in our series.

Duodenal fistula was also a more frequent complication than we are accustomed to observe under less urgent circumstances. It was encountered only following the removal of ulcers of the duodenum and immediate prepyloric area. The high incidence of this complication is attributed to the fact that we have attempted perhaps unwisely to remove too many of the technically difficult duodenal and prepyloric ulcers. The operator in his eagerness to remove a firmly fixed ulcer often finds himself irrevocably committed to an insecure duodenal closure even before dissection of the ulcer from the head of the pancreas has been accomplished. This is particularly likely to occur in the presence of a large bleeding ulcer on the posterior and postero-superior surfaces of the first part of the duodenum. The only escape from this dilemma is to dissect beyond the ulcer and obtain healthy duodenum, but the danger of damaging the common duct may prevent the necessary prosecution of this dissection.

Complete mobilization of the second part of the duodenum, a maneuver suggested by Marshall,[5] has been a great help to us, and we recommend its use early in the gastrectomy. The common duct is thus exposed above and below the point where it passes behind the duodenum, and its relationship to the indurated ulcer area can be plainly seen. The exposure thus afforded has been extremely helpful in differentiating between the case in which safe removal of the ulcer bearing duodenum can be accomplished and the one in which the ulcer should be left undisturbed and the duodenal stump closed proximal to it.

When the decision is made not to remove the ulcer, and where such a step means cutting across the stomach proximal to the pylorus, it is important to excise the antral mucosa and close the stump as suggested by Bancroft.[3]

Other complications played a minor role to that of wound disruption (table 4). There were 4 cases of small bowel obstruction that required reoperation. One of these patients died from cardiac arrest during the induction of anesthesia (case 6) and another from associated nephrosclerosis and uremia (case 3). There were 2 known cases of coronary occlusion, one of which was fatal, and 1 patient (case 7) who died suddenly on the fifth postoperative day from what was probably a massive myocardial infarction (unlisted in table 4 because there was no autopsy). There were 2 cases in which uremia played a major part in the fatal outcome (cases 1 and 3).

There were many minor complications including atelectasis, mild wound infection, and 4 cases of transient mild jaundice. There were 2 cases in which mild postoperative gastric hemorrhage was thought to have arisen from the line of anastomosis.

In treating wound disruption it is our opinion that the use of general anesthesia is hazardous because it enhances the possibilities of death from aspiration or cardiac arrest. Sedation of the patient with morphine and closure of the wound after generous infiltration of the abdominal wall layers with Novocain is an extremely easy and a safe method. The technique of closure entails the insertion of closely spaced interrupted sutures of braided silk or wire to include all layers of the abdominal wall.

A helpful method of treatment of an established duodenal or pancreatic fistula which persists beyond the usual period and which shows no tendency to spontaneous cessation is the use of strong suction. A snugly fitting catheter is placed into the fistulous tract a distance of no more than half its depth, and continuous suction applied. The strength of the suction is sufficient to collapse completely the tract

beyond the tip of the catheter, thus promoting closure. In 1 case, drainage permanently ceased after twenty-four hours of this treatment.

ANALYSIS OF DEATHS

An analysis of the deaths in the emergency operation group of patients in our series follows:

CASE 1 (1947).—J. H., a 56 year old man, began to have "coffee ground" vomitus fifteen hours before coming to the hospital. He was admitted in marked shock. Blood pressure was scarcely obtainable at 30 systolic, and blood urea nitrogen measured 94 mg. per 100 cc. (not reported until after operation). Subtotal gastrectomy was done forty-eight hours after admission for bleeding duodenal ulcer. The common duct was injured in removing the ulcer, and a T tube was placed in the rent to act as a common duct drain. Death occurred on the fourth postoperative day from uremia. No autopsy was performed.

Comment: This patient was not a proper subject for emergency surgery. Delay, with a drop in the blood urea nitrogen level, might have permitted safer elective surgery.

CASE 2 (1948).—T. S., a 56 year old man and a known hemophiliac since youth, had had one previous gastrointestinal hemorrhage eight months before. Profuse hematemesis of "coffee ground" material began the day before the patient entered the hospital and continued until gastrectomy twenty-four hours after admission. A bleeding duodenal ulcer was found involving the posterior wall of the first part of the duodenum. A stormy convalescence followed with continual oozing of blood from the drain that led to the duodenal stump. Multiple small transfusions were given in an attempt to reduce the clotting time. Wound separation on the tenth postoperative day was controlled by adhesive strapping. The patient died on the eighteenth postoperative day. At autopsy the only significant finding was an abdomen filled with old blood clots and considerable fresh blood.

Comment: This was a desperate case. Hemophilia probably represents a contraindication to the surgical approach to massive hemorrhage.

CASE 3 (1950).—W. P., a 68 year old man with severe hypertension, was admitted for treatment of low back pain. He suffered massive hemorrhage five days after admission to the hospital. Hemoglobin measured 4.0 Gm. per 100 cc. of blood, the red blood cell count was 1,970,000 per cubic millimeter, and the blood urea nitrogen was 8.0 mg. per 100 cc. A 6,000 cc. blood transfusion was given preoperatively. Operation was performed twenty-four hours after hemorrhage commenced; the blood pressure was 60/0 at the start of the procedure. An additional 4,000 cc. of blood was transfused on the operating table. The blood pressure was not obtainable during the first hour of the operation. At this time bleeding was controlled and the blood pressure gradually rose and stabilized at 140/100. The patient was well until the seventh postoperative day, when he developed signs of incomplete obstruction. This progressed, and on the twenty-first postoperative day, an entero-enterostomy for efferent loop obstruction was performed. The patient developed oliguria, then cardiac decompensation, and died nineteen days after the second operation. Autopsy revealed nephrosclerosis and tubular necrosis as the main cause of death.

Comment: This patient would have died without the emergency surgical intervention and probably would have lived had he not developed small bowel obstruction.

CASE 4 (1950).—E. T., a 32 year old woman, was admitted with severe epigastric pain. A gastrointestinal series and gallbladder visualization were negative. On the fifteenth hospital day she had a massive gastric hemorrhage of bright red blood and dark red blood in her stool. The blood pressure dropped to 80/50 and rose to 115/70 after a pressure transfusion. She bled again one hour later and was then taken to the operating room. A 5,000 cc. blood transfusion was given during the operative procedure. Exploration revealed a perforated lesion of the posterior aspect of the cardiac end of the stomach near its junction with the esophagus, and quantities of fresh blood were found in the peritoneal cavity. The incision was converted into a thoracoabdominal wound, and a total gastrectomy was performed in the belief that the lesion was malignant. The final pathologic report was "chronic perforated gastric ulcer." Convalescence was stormy with considerable cyanosis requiring an oxygen tent. On the seventh postoperative day the abdominal part of her wound disrupted but was temporarily closed with adhesive strapping. The following day formal closure was attempted under Pentothal anesthesia. The patient aspirated jejunal contents, developed a cardiac arrest, and died in spite of an attempt at cardiac massage.

Comment: As a result of similar experiences in closing wound disruptions under general anesthesia, we now resort to local anesthesia.

CASE 5 (1951).—L. O., a 55 year old man, a chronic alcoholic, was admitted to the surgical service for the care of varicose ulcers and dermatitis of the lower extremities. His blood pressure was 200/110 and he was known to be suffering from a duodenal ulcer. On the second hospital day he vomited 200 cc. of "coffee ground" material and subsequently had brown but guaiac positive stools. During the next few days he became disoriented, probably due to alcohol withdrawal, but the disorientation was transient. Three weeks after admission he had a massive hemorrhage, and the hematocrit level, which had been within normal limits, dropped to 25 per cent and the blood pressure fell to 140/80. The blood urea nitrogen level at this time was 32.5 mg. per 100 cc. Clinical evidence of bleeding persisted in spite of transfusions, and on the twenty-fourth hospital day an emergency gastrectomy was performed, and a posterior wall duodenal ulcer was removed. The postoperative course was progressively downhill. Blood urea nitrogen increased to 55 mg. per 100 cc. The patient excreted little urine, and he died on the fifth postoperative day. Autopsy revealed death to be due to an acute massive myocardial infarction.

Comment: This patient should have been considered too poor a risk for surgery.

CASE 6 (1952).—H. B., a 66 year old man, was admitted to the hospital with a three day history of tarry stools and with bright red vomitus on the day of admission. The hematocrit level was 25 per cent, blood urea nitrogen 30.8 mg. per 100 cc., and blood pressure 125/75, and his general condition was good. Surgical intervention was not contemplated, but on the third hospital day bleeding recurred and an emergency gastrectomy was performed. Convalescence was uneventful until the fourth day, when he began to show evidence of some gastric retention. This symptom progressed and a roentgenogram showed evidence of a high, efferent loop, partial obstruction which on the tenth

postoperative day became complete, and the patient was taken to the operating room for an exploratory laparotomy. During the induction of anesthesia with Pentothal and Intocostrin, he suffered a cardiac arrest and died in spite of an attempt at cardiac massage.

CASE 7 (1952).—J. W. B., a 75 year old man, was admitted to the hospital eighteen hours after the onset of weakness and the passage of black stools. He gave the history of one similar episode three years before. There had been no nausea or vomiting. On admission he was weak but not in shock. The pulse rate was 90 per minute and his blood pressure 100/60. The hemoglobin was 10.1 Gm. and the blood urea nitrogen 51.8 mg. per 100 cc. It was decided to treat the patient conservatively, and he was given 500 cc. of blood by transfusion. Late on the second hospital day the bleeding recurred massively and the patient went into shock. The hemoglobin, which had already dropped to 9.0 Gm., fell to 8.0 Gm., and the patient was given 1,000 cc. of blood. At this time the blood urea nitrogen had dropped to 49.9 mg. per 100 cc. The morning of the third hospital day, fifty hours after admission, a gastrectomy was performed as an emergency because the patient showed clinical evidence of continued bleeding. Two duodenal ulcers were found and both were removed with the stomach specimen. Convalescence was uneventful except for an elevation of temperature to 104 F. on the second postoperative day. While in a wheel chair on the fifth postoperative day, the patient developed extreme dyspnea, became red faced, and then complained of severe bilateral lower abdominal pain. He died within three minutes of the onset of the symptoms. No autopsy was done.

Comment: It is assumed that this patient died from a massive myocardial infarction. His high blood urea nitrogen level (above 50 mg. per 100 cc. on admission) represented what we now believe to be a danger signal. Except under the most urgent circumstances delay is indicated until the renal and cardiac status of such patients can be accurately evaluated and perhaps improved.

An analysis of the deaths in the delayed or elective surgery group follows:

CASE 8 (1948).—H. M. W., a 69 year old man, was readmitted to the hospital for medical treatment of a chronic duodenal ulcer. He was also suffering from pulmonary emphysema and cor pulmonale. There was no previous history of melena or hematemesis. Shortly after admission he began to have almost continuous tarry stools, and blood studies at this time showed hemoglobin 7 Gm. and red blood cells 2,500,000. Bleeding ceased after several weeks only to recur at intervals, and he was given many transfusions. On several occasions surgical consultations were obtained, but the patient was considered too poor a risk for operation. Finally, 116 days after his admission to the hospital, a rapid pyloric exclusion type of gastrectomy was performed; the duodenal ulcer not being disturbed. The patient died on the fourth postoperative day with oliguria and a blood urea nitrogen of 67 mg. per 100 cc.

Comment: This patient should have been considered too poor a risk for surgery.

CASE 9 (1952).—R. A., a 54 year old man, was admitted to the hospital following a twenty-four hour period of bleeding massively from the upper gastrointestinal tract. He had a long history as a sufferer from a chronic duodenal ulcer with several previous episodes of bleeding and had hypertension with a blood pressure of 210/120 on admission. A total of 6,000 cc. of blood was administered by transfusion during the first forty-eight hours, and at the end of this period, there was no further clinical evidence of bleeding. The blood urea nitrogen on admission was 99 mg. per 100 cc.; it rose to 107 mg. and on the eighth hospital day came down to 44 mg. A partial gastrectomy was performed on the eleventh hospital day as an elective procedure and a prepyloric gastric ulcer was removed. The postoperative course was marked by gradually increasing disorientation; the blood urea nitrogen level gradually rose to 175 mg. per 100 cc., and the patient died on the nineteenth postoperative day. At autopsy the kidneys were found to be small and markedly nephrosclerotic.

Comment: This case illustrates a real contraindication to surgery: the combination of hypertension and an admission blood urea nitrogen level of 99 mg. per 100 cc.

RESULTS

In analyzing the results of our approach to the management of massive hemorrhage, attention is directed to table 2. It compares the 85 patients who underwent emergency gastrectomy and the attendant mortality with the 40 who ceased hemorrhaging and underwent an elective procedure later during the same hospital admission. It also lists 49 patients who had no surgery because they were considered to be candidates that could safely weather the storm. Two deaths in the latter group represent two mistakes in judgment. Another patient was considered too poor a surgical risk and died shortly after admission without surgical intervention. Still another was on the medical service two days before being treated for massive myocardial infarction before the true cause of his shocked state was discovered. He died before we were able to get him in shape to withstand surgery.

A review of the deaths in the emergency group (cases 1 to 7) reveals that a few deaths might have been avoided if surgery had been delayed. Each added year of experience has modified our ideas, and our initial enthusiasm for surgery is being tempered with conservatism. We have made mistakes in a few instances in which we believed early surgery was safer than delay, but only once have we repeated the old mistake of delaying too long (case 8).

Death as a result of emergency gastrectomy occurred in less than one-tenth of the cases, the same level which prevailed in those who were subjected to no surgery during the 1947-1952 period. Deaths in only one-twentieth of the patients subjected to elective gastrectomy brought the overall mortality for massive hemorrhage down to less than 1 death in 13 cases. The surgical management employed during the past six years thus seems justified when this figure is compared with the 1 death in 5 cases which prevailed during the previous six year period of conservative, nonoperative management.

SUMMARY

A six year experience with the surgical management of 174 cases of massive gastroduodenal hemorrhage is reviewed. Eighty-five patients were subjected to emergency gastrectomy; 40 underwent elective gastrectomy after hemorrhage had ceased and during the same hospital admission; 49 were treated conservatively without operation.

The treatment of these cases is outlined, and the indications and contraindications to operation are discussed. A blood urea nitrogen elevation above 50 mg. per 100 cc. upon admission of the patient to the hospital is considered a serious prognostic sign and, except under the most urgent circumstances, warrants delay until the patient's renal and cardiac status are thoroughly evaluated.

Duodenal ulcer represented the most common source of hemorrhage (55 of 85 cases), and carcinoma as a cause was encountered only once.

The patients withstand operation well if bleeding has not been allowed to continue over too long a period, and if they receive adequate blood replacement before and during the operation.

The postoperative convalescence following emergency gastrectomy for hemorrhage is likely to be a stormy one with wound disruption occurring in 10 per cent of the cases.

Patients suffering from massive gastroduodenal hemorrhage present potential surgical problems and should be admitted to the surgical service. Gastrectomy with or without preliminary gastrotomy is the operative procedure of choice. Only a small proportion of the total will require operation within twenty-four hours of admission. A larger number will suffer serious recurring hemorrhage after a quiescent interval and then should be subjected to a gastrectomy. The remainder can be discharged under medical management. Many will need to return at a later date for an elective operation.

The surgical management which we have employed during the past six years has reduced the mortality of massive hemorrhage in our hospital from 1 death in 5 cases to less than 1 death in 13 cases.

ABSTRACT OF DISCUSSION

Dr. GEORGE W. WALDRON, Houston: Dr. Thompson has given an excellent report of progress in the treatment of a serious and sometimes baffling problem. His emphasis upon an immediate surgical appraisal of each case is important. A surgeon should be on the job from the time of admission of the patient, not only to decide whether surgery is indicated at once, but also to be able to follow through with a decision as to whether surgery is needed at all and if so, at what point.

On a hospital service such as Dr. Thompson directs it is possible to control admissions to various services, but the same cooperation in reference to massive hemorrhage must be attained throughout private practice if the death rate in such a condition is to be widely reduced. Recent conversations with a number of internists indicate that they, as a group, are greatly interested in early surgery in these cases.

I believe that there should be no question about blood replacement on admission and also during surgery. It always has seemed unsafe to allow a patient to bleed down to a point at which the blood pressure is so low that coagulation may be enhanced. Needless loss of life will occur if such a course is pursued.

The patient's age or the number of previous hemorrhages will not necessarily determine the urgency of surgery at the time the patient is first seen, though these facts may have some bearing on any decision. Certainly the importance of judging when surgery is to be done is just as great as whether it is to be done at all.

There is one group of cases which has been uppermost in the minds of surgeons in this area recently and that is the group having massive hemorrhage from the entire gastric mucosa or a large part if it is mainly the upper half. Three such cases have been reported in Houston in the past year or so. Apparently the condition is a type of hemorrhagic gastritis and the ulcerations are punctate in character. The lesions are hard to find at operation and the usual subtotal gastrectomy will not stop the bleeding, nor will an attempt to tie off the blood supply to the stomach. If this condition is confined to the stomach, a total gastrectomy will stop the bleeding, but if the upper small bowel is likewise affected, it will not control it.

I recommend Dr. Thompson's opinion regarding gastrotomy and open anastomosis. One must see the inside of the stomach and the duodenum to keep out of trouble in many cases. An open anastomosis also allows definite control of hemorrhage and causes less trauma to the remaining tissues.

One point regarding the duodenal stump is helpful and that is the utilization of a catheter in the stump for external drainage in cases in which the stump cannot be satisfactorily closed following the resection of a duodenal ulcer. In seven to ten days the catheter can be removed and the tract will close almost immediately. There is no skin irritation. In such a case I find this method preferable to leaving a soft rubber drain in the region of the poorly closed stump.

Regarding closure of the abdominal wall, I believe that the so-called secondary type of closure should be done at the initial operation. Few of these will break down.

"Should our towns and cities be attacked, a civil defense program instantly ready to minimize casualties and restore facilities vital to the prosecution of the war may mean the difference between victory and defeat. . . ."—U. S. Congressman Melvin Price.

DUODENAL DIVERTICULA

Radiologic Evaluation

R. P. O'BANNON, M.D., and OTTO H. GRUNOW, M.D.,
Fort Worth, Texas

SACCULATIONS in various parts of the gastrointestinal tract have stirred the interest of many radiologists. Although diverticula rarely produce much discomfort, their presence often is strikingly outlined and commands one's attention. In spite of good contrast there are times when the limitations of fluoroscopy and radiography impose restrictions upon the radiologist's interpretation. Such a difficulty was encountered in the following case.

CASE 1.—A 60 year old white woman with known lung metastases, who had had a carcinomatous breast removed in September, 1950, entered the hospital March 3, 1952, because of massive melena. A transfusion using 1,500 cc. of blood was required to bring the blood picture to a normal state.

A gastrointestinal tract examination performed a short time thereafter revealed that the duodenal bulb was of normal shape and activity but lay closer to the midline than usual. The loop extended far posteriorly and upward almost to the diaphragm. It filled rapidly and remained greatly dilated. Little barium passed through the duodenojejunal junction, which lay far to the right and in the usual position of the bulb. Multiple diverticula were present in the third portion and averaged 1 cm. in diameter. The findings were puzzling and the true interpretation was not evident.

Because of impending obstruction a laparotomy was carried out April 9. The surgeon reported the presence of a diverticulum measuring 15 by 20 cm. which arose from the lateral aspect of the descending duodenum and which had a large stoma. It was adherent to the posterior peritoneal surface and was not removed because of the patient's condition. The hepatoduodenal portion, as well as that portion of the gastrohepatic ligament attached to the antrum, was absent and allowed considerable mobility of the distal part of the stomach and the proximal portion of the duodenum. Several large serous cysts on the liver were present and one impinged upon the duodenojejunal flexure producing a partial obstruction. These were aspirated and the obstruction relieved.

A congenital deformity, the absence of the hepatoduodenal and gastric ligaments, therefore accounted for the unusual position of the organs. The large rapidly filling diverticulum had mistakenly been taken to be the duodenum. Its peculiarly large size and position may have been attributable to the congenital absence of the ligaments. The unanticipated and invisible cysts on the liver acted as the obstructing agent.

The unexpected surgical findings in this case first awakened our interest in diverticula. Since then we have observed much of interest, and in this paper we are presenting the fruits of our studies. In sequence are discussed the various types of diverticula, their origin, their incidence with the factors involved, their location, and finally their clinical significance.

Read before the Section on Radiology, Texas Medical Association, Annual Session, Houston, April 28, 1953.

NOMENCLATURE AND TYPES

The diverticula most commonly encountered probably belong to the false variety and could be called much more correctly mucosal herniations. By this term is meant that the diverticulum is a protrusion of the mucosa, submucosa, and muscularis through a defect in the longitudinal and circular muscular layers. It is lined externally by the serosa. In contrast, the true diverticulum is a bulge composed of all layers. Both the false and true diverticula may be of congenital origin; in the false the mucosa pushes through a developmental defect in the muscular layers, whereas in the true all layers form a sac from a bud during differentiation in growth. False diverticula most frequently are acquired. True diverticula also may be acquired but the premise would postulate disease in an adjacent organ. Inflammation in a lymph node followed by contracting adhesions might bring about such a defect.

One group of diverticula called pseudodiverticula must be distinguished from other types since diverticula in this class lie only in the duodenal bulb and represent the uninvolved remains of the bulb which has been puckered by contracting ulcer scars. Although the prefix "pseudo" is commonly translated by the word "false," in this case it does not refer to the commonly accepted classification of false diverticulum.

A chart derived from Blackwell's[3] discussion may make the differences clearer.

1. True diverticula include all layers of the gut. They may be (a) congenital (primary) or (b) acquired (secondary).

2. False diverticula include only mucosal layers protruding through the outer musculature. They may be (a) congenital (primary) or (b) acquired (secondary).

3. Pseudodiverticula are sacculations produced by the puckering action of contracting ulcer scars.

Radiographically, it is difficult to differentiate between the various types excepting pseudodiverticula in the first portion of the duodenum.

Whatever their type, diverticula consist of blind flasklike structures lined with mucous membrane, having a tunica muscularis and usually having a well formed neck. In consequence of a lack of muscularis propia they have no well defined peristaltic activity. They vary considerably in size and are characterized by a wide mouth which opens into the duodenum. In studies on cadavers Grant[10] noted that 60 per cent of diverticula had a mushroom or globular appearance, 15 per cent had a conical shape, and 25 per cent were tubular. At times they may be bilobed. Of interest with regard to the previous description, Knetsch[13] reported the instance of an unusually large diverticulum from the region of Vater's papilla which exhibited regular intrinsic peristaltic activity. One might conjecture that it represented a duplication of the duodenum or perhaps a true diverticulum of congenital origin.

Diverticula vary considerably in size. In our series of 22 cases the smallest measured 5 mm. in diameter, but it is evident that smaller ones exist. The largest was 8 cm. in diameter and was exceeded only by that in case 1, which was not included in this series. The latter, measuring 15 by 20 cm., may represent the largest recorded in the literature. One that may have been larger is attributed to Lockwood,[14] who mentioned a diverticulum containing 1,000 cc. of fluid.

ORIGIN

Although diverticula are frequently seen and studied, their origin is still shrouded in conjecture. The explanation based on a defect in development is easily accepted since one is accustomed to see congenital variations in other portions of the body.

The origin of acquired diverticula is less readily explained. The postulate that an area of lowered resistance exists in the wall where the vessels penetrate is commonly accepted. Beck[2] presented a theory of the origin of diverticula in the stomach which is unique and difficult to understand without a knowledge of the postulate of Gösta Forssell.[9] Gastritis is required. As the increased blood supply incident to the inflammation subsides, the volume and viscosity of the submucosa changes leaving a depression into

d. Diagram of the operative findings. Note the anomalous position of the duodenum, the cyst on the liver, and the large diverticulum.

which the mucosa flows by "autoplasticity." It is difficult to see how this theory could be applied to the duodenum.

Since the incidence of duodenal diverticula increases as the age of the person increases, Butler[4] suggests that they originate as traction diverticula at the site of arteriosclerotic intraduodenal vessels. In this early phase they still possess all the muscle coats, which split as the defect enlarges. Undoubtedly associated with vascular changes are senile changes in the supporting tissues such as are encountered in instances of hiatus hernia and inguinal hernia which frequently become manifest in later life.

Additional theories regarding the mode of development of diverticula may be summarized as follows: Some believe that traction of the adjacent blood vessels secondary to changes in nutrition and occasioned by visceroptosis may produce the focal points; others believe that local defects are produced by fatty degeneration, others that the inherent greater duodenal pressure occasioned by the closure of the pyloric sphincter plays an important part, and still others that a localized pancreatic necrosis is important. The merits and failings of the collected theories have been reviewed by Odgers.[17]

The theory which is probably the most acceptable, though not completely convincing, is set forth in Odgers' article in a passage which reads as follows:

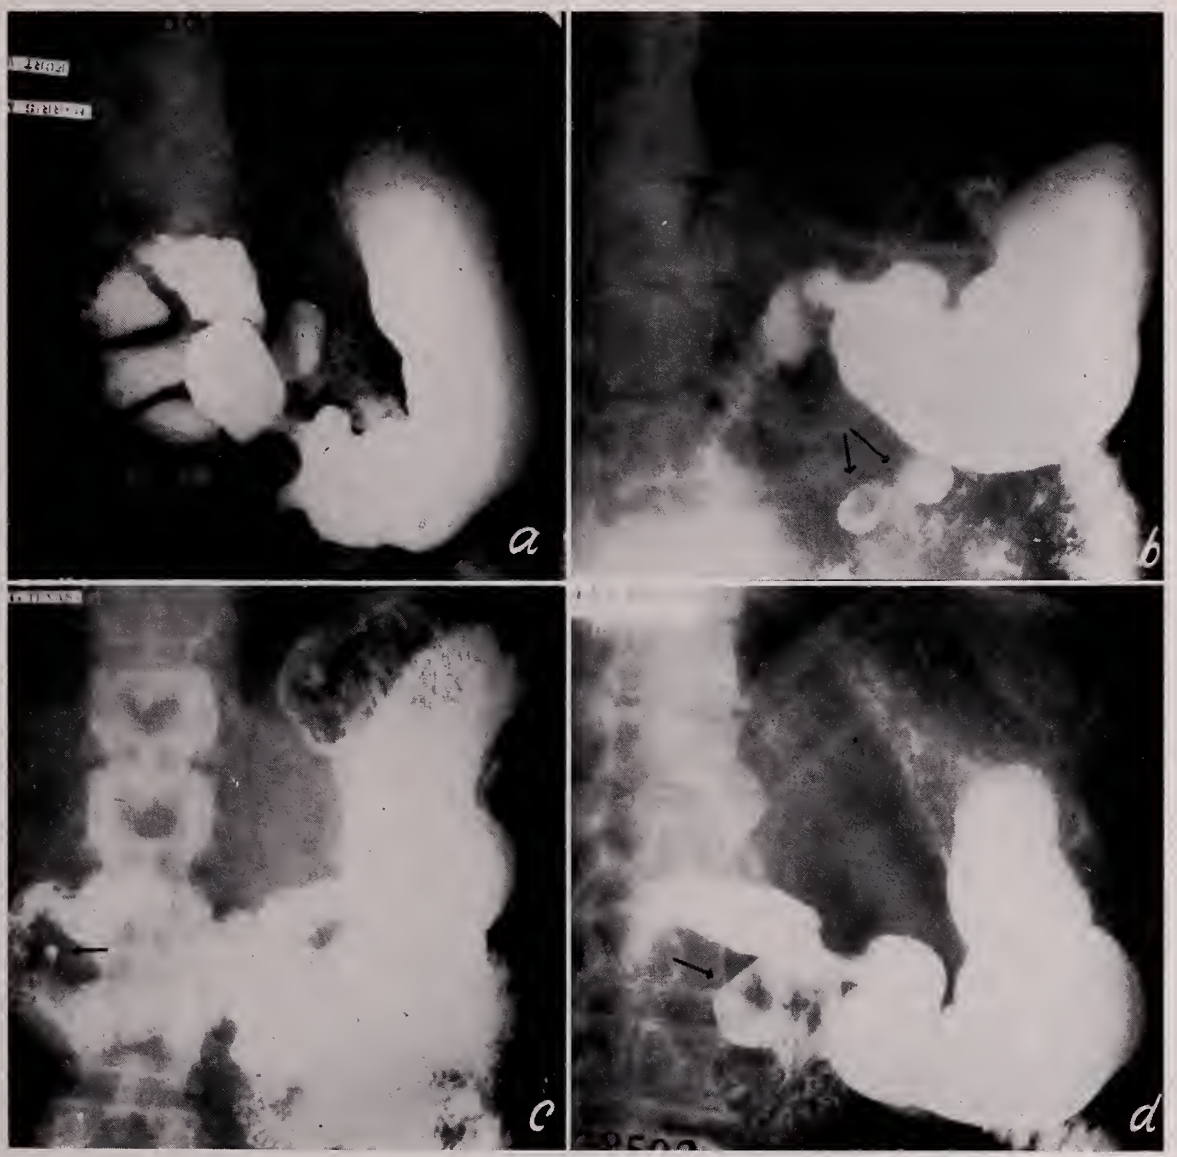

FIG. 2. a. Multiple diverticula in the descending and ascending portions of the duodenum.
b. A bilobate duodenal diverticulum.
c and d. Small (*a*) and large (*b*) duodenal diverticula.

"It is suggested that, at some time during the later six months of fœtal life, an exaggerated downgrowth of Lieberkühn's crypts may reach lacunæ in the muscular coat, where this is pierced by the blood vessels: the perivascular sheaths of the latter will then provide an easy path for any further extension. From such weak spots pulsion diverticula may arise during adult life."

Of particular interest and representing a source of speculation is the frequency with which deposits of aberrant pancreatic tissue are observed in the neighborhood of diverticula. At times this has been true in the esophagus, stomach, and duodenum. Horton and Mueller[11] have studied this phase thoroughly in postmortem material and have concluded that ectopic pancreatic tissue is the cause of the small local areas of decreased resistance which later allow the mucosa to protrude. They disagree with Odger's theory and maintain that vessels suitable for the production of weak areas do not commonly occur at the site of the diverticula.

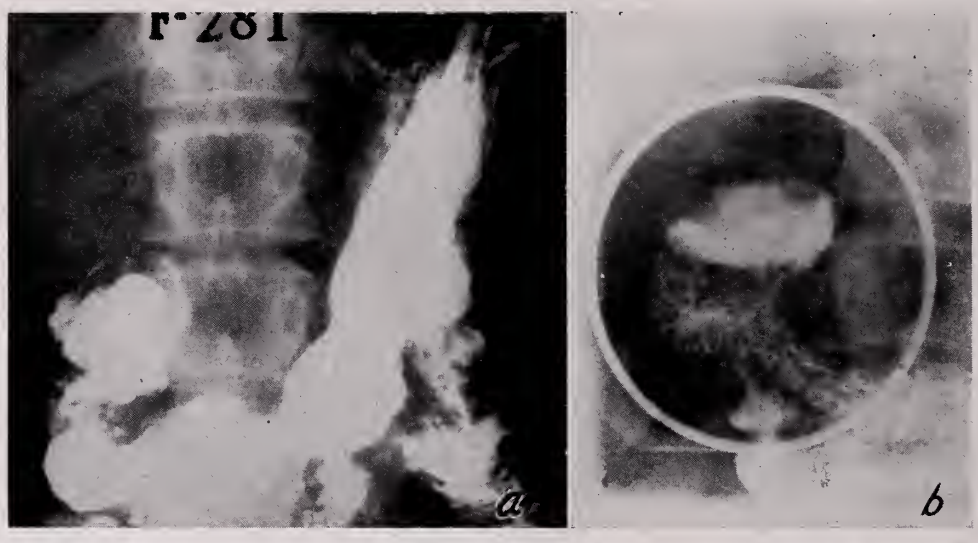

FIG. 3. The effect of spot film radiography with compression. a. Routine film which is difficult to interpret. b. A spot film made with compression clearly reveals the diverticulum.

Such are some of the common theories. They represent a great deal of thought but leave much for speculation.

INCIDENCE

Statements in the literature regarding the incidence of diverticula are difficult to harmonize since the percentages vary from 0.32 to 22 per cent. An excellent comparative table made by Ackermann[1] might be consulted for further information.

The examination of cadavers in the dissecting room should be the most accurate, yet here the incidence varies from 16 to 22 per cent. Obviously some difficulty in detecting diverticula was anticipated since both Grant and Ackermann injected specimens with a solidifying mass before studying them. Because of the care taken, one would expect that their figures should be the more representative.

Information obtained from the autopsy table also should be fairly accurate, yet percentages from this source vary from 3 to 13.3 per cent. The undertaking of an autopsy is a large task. Although the approach may be conscientious, limitations are inherent. Interest in a particular organ; limitations of time, technique, experience, and conscientiousness of the prosector; and complexity of the anatomy about the diverticulum may determine the number of diverticula detected. Statistics drawn over a period of many years from the work of many prosectors in a department may not be as accurate as the large figures lead one to believe.

The radiographic examination is limited by similar factors; witness the variation in the incidences reported by radiologists in the literature, which vary from 0.16 to 5.19 per cent. Case,[5] who first discovered the duodenal diverticulum roentgenologically, developed an interesting technique which required the patient to turn rapidly from his right side to the supine position, holding his breath in deep inspiration, while the examiner occluded the duodenojejunal juncture and simultaneously forced the barium through the pylorus. By this method he was able to show an incidence of 1.3 per cent in 6,847 examinations. Although only a few examiners use this maneuver, for the most part the patient assumes the various positions and experiences pressure of varying degree to the duodenojejunal area during the examination.

Weig[19] has expressed the opinion that an extra ef-

fort to demonstrate diverticula is in order since they do not fill readily in the upright position. Davis and Budd[7] have thought that the size is important, in that the smaller diverticula fill less rapidly. It is interesting to note that the smallest one recorded in the dissections of Ackermann,[1] who reported an incidence of 22 per cent, was only 5 mm. We encountered two of similar size in 22 cases. We do not believe that special methods of examination are ordinarily necessary. An observant eye alert for any unusual findings, synchronized with the use of one's ingenuity to demonstrate the presence of diverticula, is all that is required.

As suggested by Weintraub and Tuggle,[20] the diverticulum must at times be considered a dynamic rather than a static structure. They mean that diverticula may be present at one time and absent at another. Several instances of such an observation are in the literature. A parallel phenomenon might be seen during curling in the esophagus when the contraction may be so severe and prolonged as to suggest multiple diverticula.

In review, the variability in reported incidences may be dependent on the (1) source of material—whether from the dissecting room, the autopsy table, or radiographic examination—and on the (2) qualifications of the observer—his experience, training, conscientiousness, and interest.

Aside from the irreducible minimum of oversight inherent in the examination, one factor, the views of several authors notwithstanding, must be considered important, namely, the age of the patient in whom a diverticulum is present. The age was first stressed by Grant.[10] Only by such a postulate is it possible to explain the extraordinarily low incidence of 0.32 per cent reported by Whitmore,[21] who observed only 18 cases in 5,712 examinations; the material for his paper was obtained primarily from the examinations of military service personnel. In an addendum he reported an increase in incidence to 3.9 per cent in civilian practice. Fawcitt[8] likewise reported a low incidence of 0.63 per cent in 3,000 examinations done on military personnel.

We have kept records on a series of 400 routine examinations of the upper gastrointestinal tract. Although a definite interest in the detection of diverticula was manifest, no special procedures were carried out to determine their absolute presence or absence. From this group 22 cases of diverticula were obtained, representing an apparent incidence of 5.5 per cent. Since our figures were somewhat higher than those in the literature, which varied from 0.16 to 5.19 per cent, we examined the group according to age decades but failed to note an unusual predominance in any decade. We were of the opinion that the ages of our patients were representative of the average clinic and hospital population.

The findings of our study are summarized in table 1.

TABLE 1.—*Incidence of Duodenal Diverticula According to Age Decades in 400 Gastrointestinal Studies.*

Decade	No. of Patients	Patients with Diverticula	
		No.	%
1-9	7	0	
10-19	6	0	
20-29	51	0	
30-39	71	3	4.2
40-49	78	3	3.8
50-59	100	6	6.0
60-69	60	7	11.7
70-79	22	3	13.6
80-89	5	0	

Horton and Mueller[11] and Davis and Budd[7] also recorded the number of diverticula according to age decades but did not include the number of patients in each decade examined, so that no true age relationship can be drawn.

Grant[10] divided his patients into two groups; the age of 52 years formed the division point. He noted a percentage of 3.9 for those younger and 15.8 for those older. It was on this basis supported by statistical testing that he maintained there was a greater incidence after the age of 52. If our group is divided in the same manner, an incidence of 2.8 per cent for those younger than 50 years and of 8.5 per cent for those older is obtained. These figures and the trend of the percentages noted in table 1 give added weight to the factor of aging in the appearance of duodenal diverticula.

LOCATION

The location of diverticula is also of interest. The majority lie in the inner curve of the second portion of the duodenum, that portion in closest association with the pancreas. It represents the mesenteric portion of the bowel. Though many of the sacculations may lie within the pancreatic parenchyma, a goodly number also lie anterior and posterior to the organ so that no absolute relationship between diverticula and the pancreas can be drawn. The usual findings in the area represent false diverticula. A comparison of the location of diverticula according to various authors is made in table 2; our observations are in close agreement with those of other authors.

TABLE 2.—*Anatomic Distribution of Duodenal Diverticula.*

	Portion of Duodenum			
	First %	Second %	Third %	Fourth %
Fifth Avenue Clinic and Harris Hospital	0	64	16	20
Weintraub and Tuggle	1.7	72.5	14.9	10.9
Davis and Budd	1.7	85	13.3	
Whitmore	0	60	30	

SIGNIFICANCE

To many, the presence of diverticula represents only an incidental finding indicating that a complete examination has been performed. The attitude is based on fact, since the incidence of secondary disease in such a lesion is infrequent. No conclusive evidence of disease could be ascribed to the diverticula found in our study. However, at frequent intervals a warning in the literature that diverticula may become diseased and require surgical removal if medical care fails is recorded.

Diverticulosis of the colon is relatively common and retention of fecal material for long periods is accepted. The frequency of diverticulitis in diverticulosis, however, is not great. It would therefore be probable that even less secondary disease would be anticipated in the duodenum, where the material is sterile, the ostia large, and drainage rapid. In retrospect, there are probably times when unneutralized acid contents of the stomach might reach them and cause irritation.

We do not believe that retention of material in the duodenum is common. In 18 consecutive cases, Case[5] observed that barium was retained for eleven hours. This we were unable to confirm since in the majority of our cases no retention could be demonstrated after six hours. A few of the moderate or larger diverticula in which the fundus was directed upward frequently collected air. It also must be remembered that portions of barium retained in the stomach may be intermittently propelled into the duodenum. The diverticula also may collect a portion of barium giving the impression of retention.

No classic symptomatology of diverticulosis has been detected nor are the symptoms of secondary disease clear cut. Almost invariably the literature indicates that disease in adjacent organs has to be ruled out first and that a diverticulum is implicated by exclusion. With an ulcer of the duodenum the classic symptoms of peptic ulcer appear and are improved by medical management. An unexplained source of gastrointestinal bleeding has been traced at times to a bleeding diverticulum. Carcinomatous changes have repercussions in adjacent organs and the whole body. Increase in the size of a diverticulum with constriction of the neck, foreign body incarceration, and the presence of parasites all may play a part. It is interesting to note that Chomel[6] in the first description of a supposed diverticulum described the presence of 22 gallstones.

Disturbances in adjacent organs such as disease of the bile duct, pancreatitis, carcinoma of the pancreas, or visceroptosis may produce trouble in otherwise benign diverticula by causing an obstruction. Conversely, diseased diverticula may produce profound changes in adjacent organs by occluding bile ducts or pancreatic ducts, and even by causing thrombosis of the superior mesenteric artery. It is said that perforation of a diseased diverticulum in the retroperitoneal spaces is generally fatal probably because of the surgeon's inability adequately to mobilize the structures and protect the pancreas.

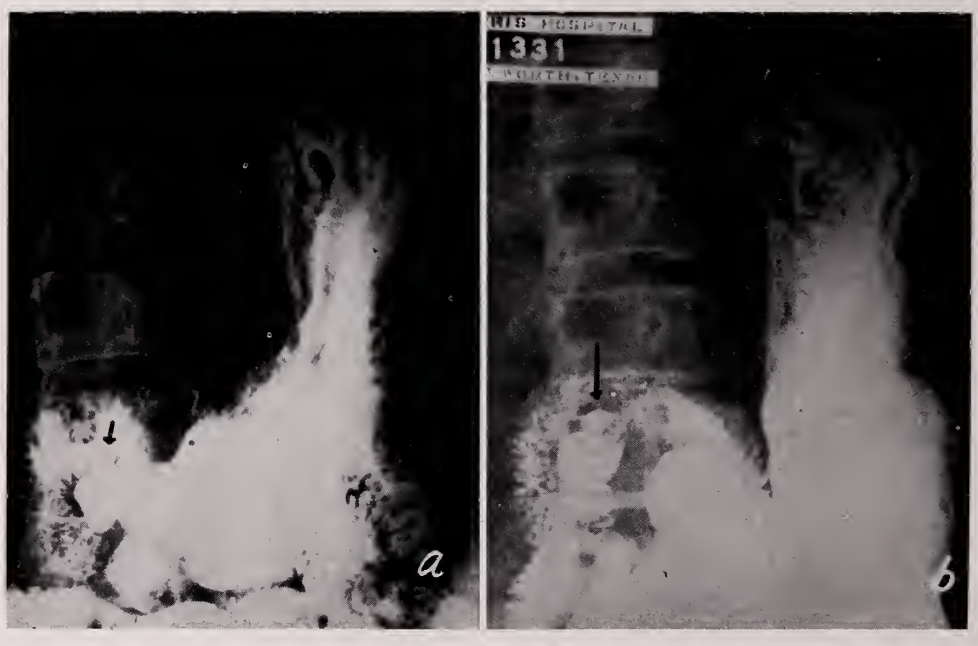

FIG. 4. Case 2. a. The arrow points to a defect interpreted as an ulcer. b. Six months later the defect resembles more closely a diverticulum.

A few cases of diseased diverticula from the literature might be cited. Weig[19] described a 4 mm. ulcer in a diverticulum occurring in a 77 year old man who had developed severe epigastric pain. Kinzer[12] reported an obstruction produced by a saccular structure covered by mucous membrane within the lumen of the descending limb of the duodenum which he considered to be an intraluminal inverted diverticulum.

Nash and Palmer[16] cited a defect in the second portion of the duodenum which was considered to be a diverticulum but which disappeared after therapy. We would like to mention a similar case.

CASE 2.—A 38 year old woman developed epigastric discomfort, had tarry stools four days later, and vomited coffee ground–like material. Gastrointestinal examination revealed a defect in the second portion of the duodenum which was thought to be an ulcer. Six months later after a good recovery on medical management reexamination revealed the presence of a diverticulum in this same location. Does this represent a diverticulum formed from a previous ulcer as some authors infer?

More and more instances of effective excision of duodenal diverticula are being reported. Although considered by some to be relatively difficult, such a procedure is definitely required should evidence of secondary disease be demonstrated. Patterson and Bromberg[18] enumerated 34 cases of diseased diverticula removed. Mahorner and Kisner[15] listed an additional 4 cases. The cases of Kinzer[12] might also be added. Surgeons are fairly consistent in requiring that any disease in adjacent organs be ruled out before the duodenum is considered the source of difficulty.

CONCLUSION

Four hundred radiologic gastrointestinal examinations revealed 22 cases of diverticulosis of the duodenum, a relatively high incidence in spite of limitations inherent in the mode of examination. The distribution of diverticula resembled that described in the literature with the greater number lying in the second portion of the duodenum. The higher incidence in patients older than 50 years of age was noted, as was emphasized by Grant.[10]

The presence of diverticula for the most part is best explained on the basis of inherent sites of weakness which lie about the vessels perforating the musculature and which are further weakened by aging. Although the greater number are asymptomatic, diverticula must nevertheless always be closely examined and considered since occasionally they have been shown to be the site of a secondary lesion.

ABSTRACT OF DISCUSSION

DR. V. H. SHOULTZ, Abilene: The question I am asked by the clinician is, "What is the significance of the diverticulum in this gastrointestinal study?" The literature indicates that from 2 to 10 per cent of those demonstrated cause symptoms. I am of the opinion that 2 per cent is probably a high figure; at least I have not recognized symptoms in 2 per cent of cases of diverticulosis of the duodenum which I could say were definitely due to a diverticulum.

However, the symptoms produced are worth remembering. In order of frequency they are:

1. Pain, which occurs in 85 per cent of the symptomatic cases. This may be mild epigastric distress or severe dull aching pain; it often occurs during or after eating.
2. Nausea and vomiting.
3. Diarrhea due to pancreatic disease or to putrefaction in the pocket.
4. A feeling of distention in the epigastrium.
5. Tenderness in the right lower epigastrium.
6. Febrile reaction.
7. Gastrointestinal hemorrhage.

These symptoms may be brought on by inflammation or distention of the sac, inflammation of surrounding tissue, or pressure on surrounding organs. The complications of these disorders have been well covered by Drs. O'Bannon and Grunow.

Radiologically speaking, diverticula are considered signifi-

cant when symptoms cannot be explained by other disease and/or when on roentgen examination there is localized tenderness over the diverticulum; changes such as a persistent fleck are demonstrated in the mucosa; mucosal changes are seen in the adjacent duodenum; irritability in the duodenum about the lesion is demonstrated; or stasis in the duodenum or in the diverticulum is present.

With these symptoms and radiographic signs in mind, the examiner should be able to decide whether a diverticulum needs surgical intervention or medical treatment.

LESS COMMON MANIFESTATIONS OF ULCERATIVE COLITIS

CAROLINE W. ROWE, M.D., Galveston, Texas

WHEN the term chronic ulcerative colitis is used, one immediately visualizes a fibrotic, shortened, "pipe-stem" colon with complete loss of the normal haustral markings. So accustomed have physicians become to thinking of this type of lesion that many are prone to overlook the other appearances of this disease, and in his practice a radiologist may find many a "doubting Thomas" who will be reluctant to accept his interpretation of other findings in a barium enema study as chronic ulcerative colitis. This was brought to my attention recently in the handling of 2 interesting cases which were excellent examples of the less common forms of ulcerative colitis.

The formation of islands of nonulcerated hypertrophic mucosa resulting in a pseudopolyposis is one of the appearances of chronic ulcerative colitis. Fistulas are commonly encountered in ulcerative colitis in the rectum and sigmoid colon, but I have found only 2 reports or accounts of a gastrocolic fistula such as I wish to discuss momentarily. In surveying the literature I have found the incidence of involvement of the terminal ileum to be as high as 28 per cent and yet I find this fact is not generally known.

I have 2 cases with which I should like to illustrate these points.

CASE 1.—L. T., a 50 year old white woman, was admitted to John Sealy Hospital on June 25, 1949, with a chief complaint of fistulas, weakness, and weight loss. For the past three years the patient had had diarrhea consisting of three to seven thin stools per day. She frequently passed pus and occasionally had bleeding from the bowels. She had lost 80 pounds in the past year. Two years previously, a rectal fistula had been lanced and had continued to drain. At the time of admission she had 10 to 12 fistulas throughout the perineum from which pus exuded.

Roentgen-ray examination revealed a markedly irregular contour of the colon with multiple filling defects in the lumen of the bowel. There was a long fistulous tract encountered at the splenic flexure, and as this was observed under the fluoroscope, the tract was seen to lead into the stomach (fig. 1a). The entire length of the colon was thought to be somewhat shortened. The filling defects were better visualized on the next examination, which was a double contrast study of the colon (fig. 1b). The findings were interpreted as pseudopolyps, gastrocolic fistulas, and rectal fistulas secondary to chronic ulcerative colitis.

An examination three months later revealed the gastrocolic fistula to be almost closed, there being only a small tract leading half way to the stomach. Conservative therapy was continued.

In 1952, the patient was readmitted to the hospital after an exacerbation of the colitis. Reexamination revealed some improvement in the appearance of the colon, but there were still ulcerations and pseudopolyps (fig. 1c and d). A total colectomy was performed. The specimen showed no evidence of the old gastrocolic fistula, but ulcerations, pseudopolyps, and much scar tissue were evident (fig. 2).

Let us consider the mechanism of the development of such a picture. The first pathologic changes of ulcerative colitis are hyperemia and edema of the mucosa, followed by shallow erosions. As the inflammatory process continues, the edema and ulcerations become more marked. The mucosal surface may be covered with an adherent inflammatory membrane in places. Then the ulcers begin to coalesce, and denudation of the mucosal surface occurs. In many cases a totally irregular mucosal surface results. Polypoid and proliferative hyperplastic tissue occurs in some areas, a smooth, denuded surface in others. Eventually there is replacement of the muscular fibers by inflammatory tissue, and contraction of scar tissue occurs. If the colon were smoothly denuded, one would expect the scar contraction to result in the shortened pipe-stem colon. If the process were irregular and allowed the formation of hyperplastic tissue, pseudopolyps would occur and the contraction of scar tissue would serve to emphasize the projection of the polypoid areas into the lumen of the bowel.

When ulcerations penetrate the wall of the colon, they tend to form small abscesses. These abscesses may involve adjacent bowel or other structures in their walls, and with the attempt to drain themselves the abscesses may open into adjoining structures and produce fistulas.

From the Department of Radiology, University of Texas Medical Branch.

Read before the Section on Radiology, Texas Medical Association, Annual Session, Houston, April 28, 1953.

The second case illustrates the third point I wish to emphasize.

CASE 2.—J. G., a 52 year old white man, was admitted to John Sealy Hospital on December 7, 1951, with a chief complaint of having had diarrhea since 1950. He had begun to have cramping abdominal pains recently. In February, 1951, he had had a perineal fistula lanced; it had continued to drain.

Roentgen-ray examination when the patient came to John Sealy Hospital revealed extensive involvement of the colon with ulcerations and pseudopolyps. In addition there was involvement of the ileum for nearly 2 feet (fig. 3a).

The patient was treated conservatively and discharged improved. He was readmitted on July 18, 1952, with an exacerbation. At this time he had 4 perineal fistulas. Barium enema study showed improvement in the appearance of the colon, but there was still evidence of disease (fig. 3b). The postevacuation roentgenogram was particularly helpful in determining this fact as it demonstrated nicely the change of the mucosal folds to a more parallel arrangement produced by the hypertrophic changes which had been noted previously (fig. 3c). The terminal ileum could not be filled on this examination, and as its condition is of prognostic importance, a motor meal was used to obtain adequate visualization of the small bowel. It appeared unchanged (fig. 3d).

On September 12, 1952, a colectomy was performed and the involved ileum resected. Long areas of coalescent ulcers were found and many pseudopolyps. The right side of the colon was relatively free of disease. The ileum was ulcerated and contracted for 2 feet (fig. 4).

Involvement of the ileum is said to occur in 20 to 28 per cent of cases of ulcerative colitis. The process is the same as that taking place in the colon, but there is usually a lesser degree of narrowing of the lumen and shortening as is seen in the colon. There is a loss

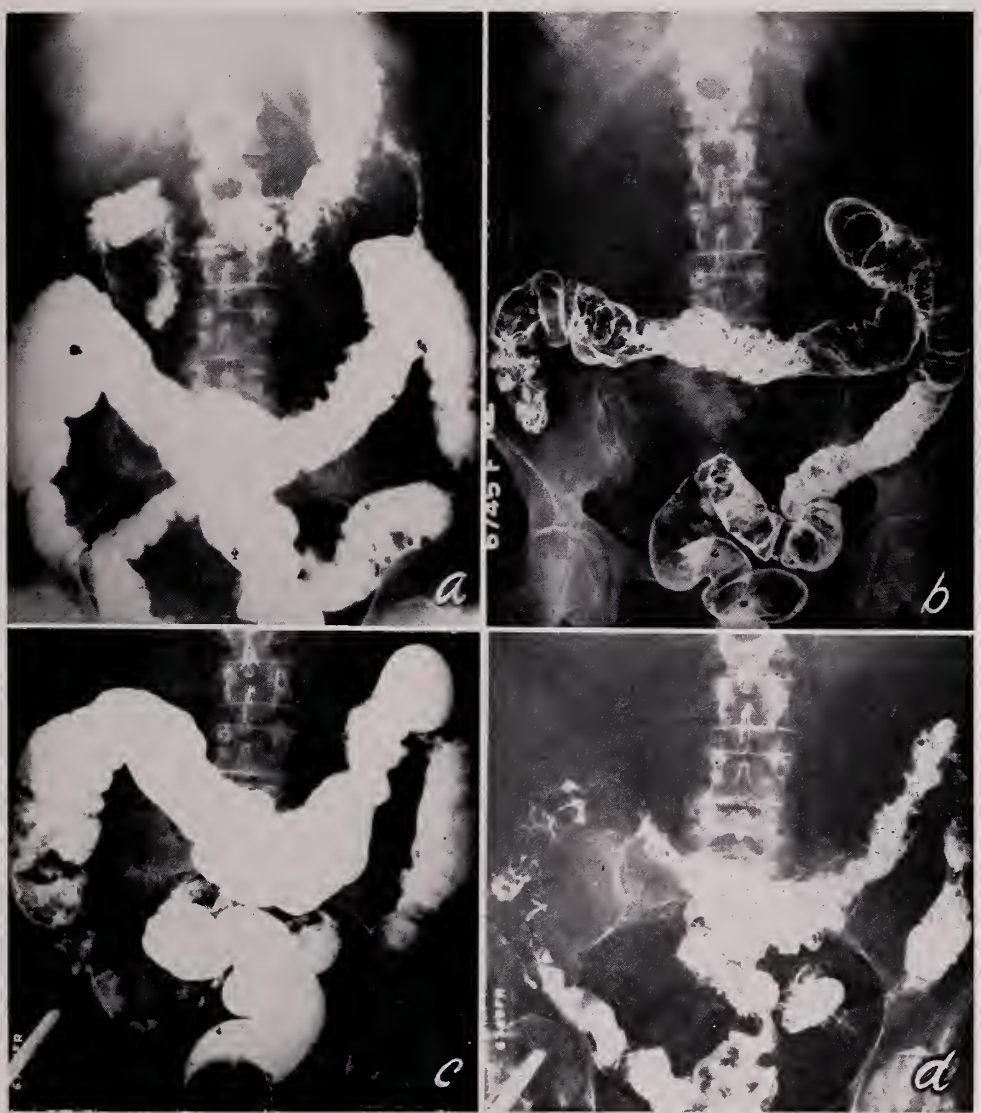

FIG. 1. Case 1. a. A roentgenogram showing marked irregularity of the contour of the colon with some shortening and multiple filling defects in the lumen. A long fistulous tract leads into the stomach.

b. A double contrast study demonstrates multiple pseudopolyps.

c. A roentgenogram showing that ulcerations and pseudopolyps remained after conservative treatment.

d. A postevacuation roentgenogram made at the same time as *c* showing the pseudopolyps.

of the markings of the valvulae conniventes and the outline of the ileum is serrated because of small ulcerations. The length of the involvement may be from a few centimeters to several feet.

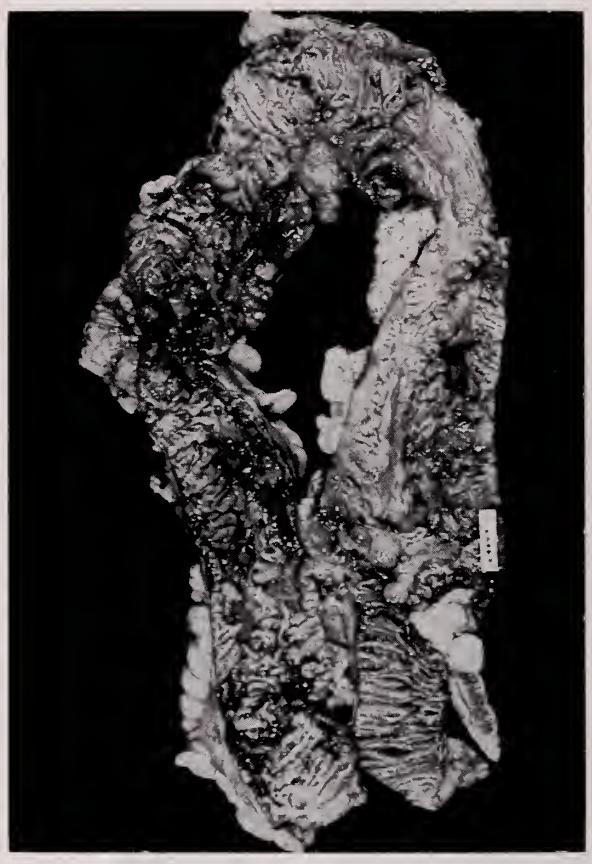

FIG. 2. Case 1. A photograph of the removed colon confirms the roentgen-ray findings.

DISCUSSION

The majority of the reports in the recent literature concerning ulcerative colitis have dealt with the treatment of these cases. There are few articles on the roentgen appearance and especially on that of these less common manifestations.

The formation of pseudopolyps has been mentioned for many years but for the most part only casually or as inclusions in statistical analyses. It is of interest to note that in 1721 Menzel described a case of generalized inflammation of the colon with a number of wartlike excrescences. This specimen was obtained from a soldier who had died of chronic bloody diarrhea. In 1861 Virchow named this condition colitis polyposa. In 1915 Hewitt and Howard[5] published an article on ulcerative colitis with polyps. In1942 Brown, Buie, and Weber[4] at Mayo Clinic found 41 cases which did not conform with the usual picture of ulcerative colitis. These authors described the usual roentgen-ray appearance as general contraction, narrowing and shortening of the colon, destructive changes in the intestinal wall and mucous membrane, and diminished flexibility and mobility. In the cases under consideration in their paper, there were hyperplastic and productive elements. A patchy, irregular distribution of the ulcerative and hyperplastic process was found. Since that time there have been no articles in the literature dealing with this appearance as such. Statistical studies show the occurrence to range from 10 to 15 per cent. Surely this interesting feature of this disease deserves more emphasis.

The gastrocolic fistula is of interest because of its rarity, at least as the paucity of reports in the literature would indicate. The fistula in case 1 was unusually long, and it was interesting to watch its spontaneous closure.

The involvement of the ileum should be emphasized, I believe, because of its prognostic importance. There was one excellent article dealing with this in 1949 by McCready, Bargen, Dockerty, and Waugh[6] from Mayo Clinic. They pointed out that the disease of the ileum was the single most important factor for the high mortality rate and failure of operative procedures such as ileostomy in these cases. Therefore, it is important that the ileum be studied adequately, and since it is not uncommon for the diseased ileum to fail to fill in the barium enema study, it is necessary to be persistent and to demonstrate it one way or another.

DIFFERENTIAL DIAGNOSIS

When cases such as these are encountered, there are few conditions to be considered in the differential diagnosis. Amebic colitis may assume the appearance of the polypoid type of ulcerative colitis and may be indistinguishable roentgenographically. The discovery of the etiologic agent in amebic cases should not be difficult, and the differentiation is up to the clinician and the laboratory technician. The type of ulcerative colitis showing the contraction, fibrosis, and shortening offers additional possibilities for a differentiated diagnosis which I shall not discuss.

When the ileum is involved, there is more cause for speculation. In 1932, Crohn described a necrotizing and cicatrizing inflammation confined to the terminal ileum which he termed regional ileitis. The original description emphasized diarrhea, abdominal pain, fever, weight loss, symptoms of partial obstruction, and formation of fistulas from the ileum. There was no evidence of involvement of the cecum. Later, the same pathologic and clinical features were reported in other segments of the small intestine, and the original report describing the failure of the lesion to pass the ileocecal valve into the colon had to be revised. The dis-

ease in the colon does not differ pathologically from that seen in ordinary idiopathic colitis. Therefore, it is sometimes a question of whether the disease began in the ileum and later involved the colon or vice versa. Bockus has expressed the opinion that the rectosigmoid area is not involved when the colon is diseased secondary to regional ileitis. This belief is an aid in differentiation as the rectosigmoid area is thought to be the first site of involvement in chronic ulcerative colitis. The conditions to be differentiated from regional ileitis are tuberculosis and, rarely, amebic infection. However, when there is such marked involvement in the colon as in these cases, the other possibilities are remote.

The same is true in considering the differential diagnosis of the gastrocolic fistula. If seen without the generalized involvement of the colon, one would think first of carcinoma. Carcinoma does occur in the presence of ulcerative colitis (some say in 5 per cent of the cases), but there should be characteristic findings to distinguish cancer. Tuberculosis, fungus disease, and simple ulcer are other rarer causes of gastrocolic fistula.

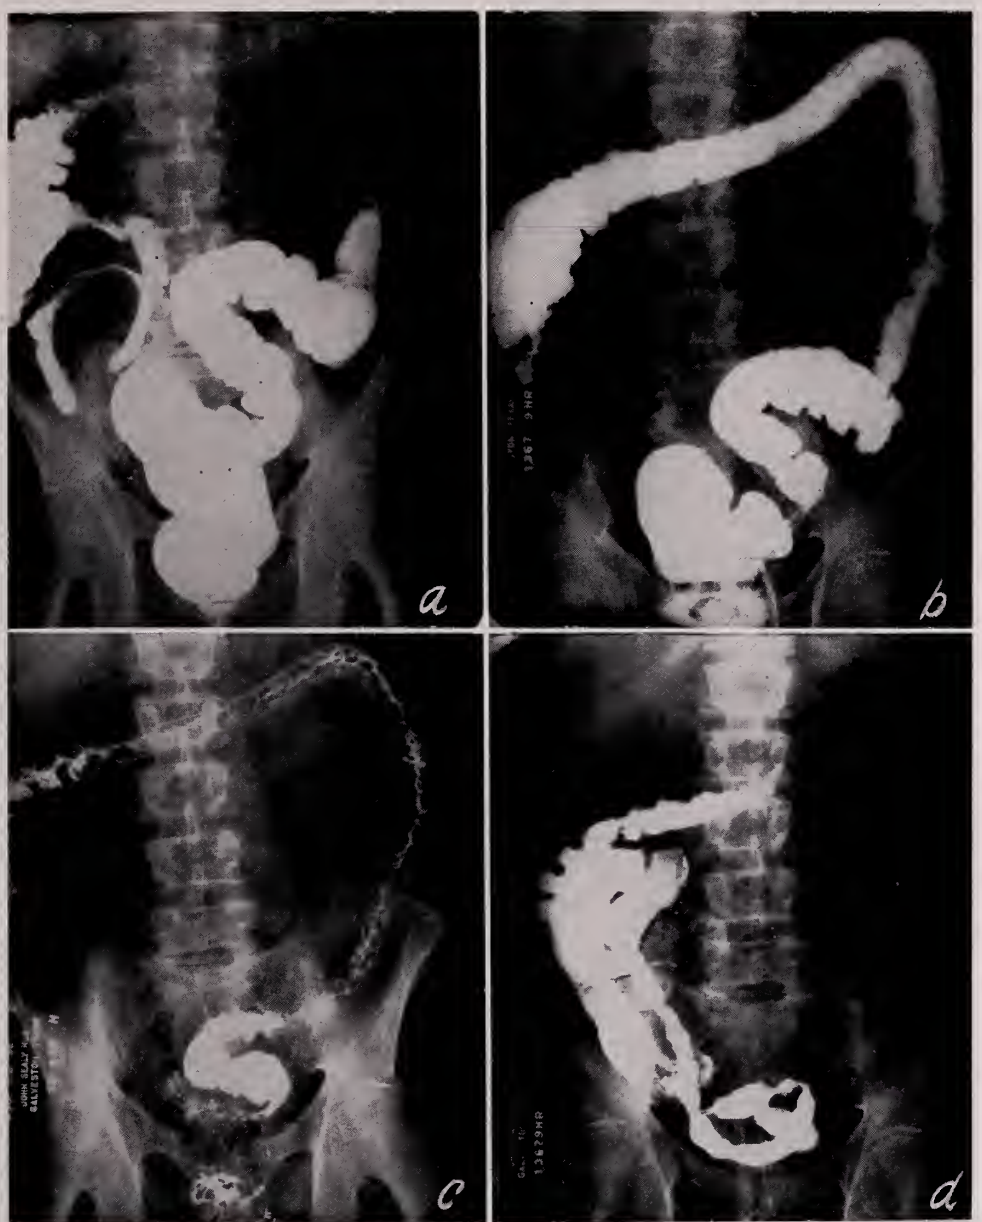

FIG. 3. Case 2. a. A roentgenogram demonstrating ulcerations and pseudopolyps as well as involvement of the terminal ileum for 2 feet.
b. Barium enema indicated improvement after treatment, but evidence of disease is still seen in the roentgenogram.
c. A postevacuation roentgenogram made at the same time as *b* shows hypertrophic changes causing the mucosal markings to lie in a more parallel arrangement.
d. The terminal ileum is demonstrated by means of a motor meal, and the diseased ileum is again noted.

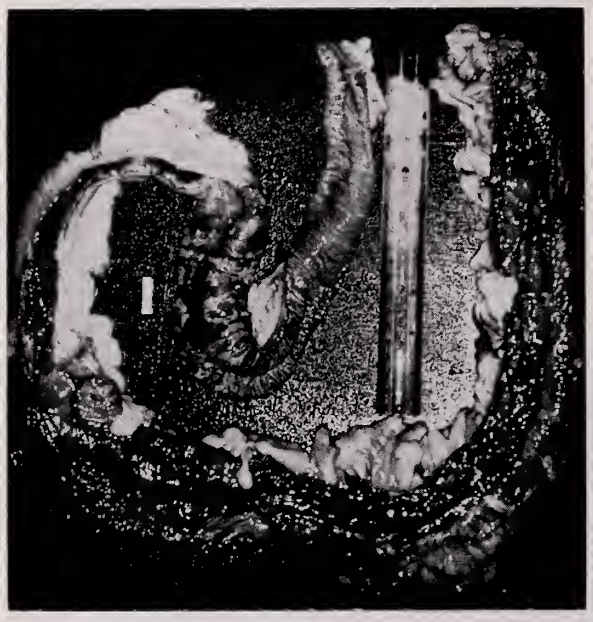

FIG. 4. Case 2. Photograph of the specimen after resection of the colon and 2 feet of ileum showing multiple pseudopolyps and long coalescent ulcers. The ileum is ulcerated and contracted.

SUMMARY

The less common manifestations of chronic ulcerative colitis are discussed. The formation of pseudopolyps occurs in 10 to 15 per cent of the cases, involvement of the terminal ileum in 20 to 28 per cent, and gastrocolic fistulas rarely. These appearances are interesting radiographically, of prognostic as well as diagnostic importance, and deserve more emphasis than has been given them in the past.

ABSTRACT OF DISCUSSION

DR. HERMAN C. SEHESTED, Fort Worth: Dr. Rowe has shown three unusual features of ulcerative colitis, or rather of advanced ulcerative colitis. Pseudopolyposis is a well recognized and generally accepted manifestation of advanced ulcerative colitis.

Gastrocolic fistula, however, is an unusual complication of ulcerative colitis. Dr. Rowe pointed out carefully in discussing differential diagnosis that ulcerative colitis is not the most common cause of gastrocolic fistula, and when we see a gastrocolic fistula, we should not think first of ulcerative colitis because we have heard of her case.

The third unusual feature of ulcerative colitis which she has shown is involvement of the terminal ileum. She mentioned that this feature had particular prognostic significance. It has been noted that the terminal ileum is involved with a particularly fulminating type of ulcerative colitis and often in right-sided cases of ulcerative colitis in which the sigmoid is not implicated. Her case, however, did show involvement of the sigmoid.

She mentioned particularly the difficulty in filling the terminal ileum. The first essential in filling the terminal ileum is to have the colon well prepared, preferably with castor oil. Maneuvers to fill the terminal ileum should include having the patient lie prone and then lean to the right. Of course, in some cases it cannot be filled no matter what the maneuver. It might be well to state that it is not always desirable to fill the terminal ileum. To be sure, the only way of having definite proof the cecum is filled, that is, that the entire colon has been filled, is to demonstrate filling either of the terminal ileum or the appendix. However, routine filling of the terminal ileum or especially overfilling of the terminal ileum will cover up more lesions than it uncovers by obscuring the sigmoid. Again, let me emphasize that we should know what we are attempting to demonstrate and individualize the examination accordingly so that we will come up with the information we want rather than simply carry out a routine procedure.

Tennessee Postgraduate Courses

Scheduled for 1954 by the University of Tennessee College of Medicine, in cooperation with the John Gaston Hospital and Le Bonheur Children's Hospital, Memphis, are the following postgraduate courses: pediatrics, March 10-12; abdominal surgery, March 31-April 2; obstetrics and gynecology, May 19-21; trauma, July 28-30; management of simple fractures, September 15-17, and clinical electrocardiography, October 6-8.

Further information may be obtained from the University's Postgraduate Department, 4 South Dunlap, Memphis.

Medical Tour of Europe

Texas physicians have been invited to join members of the California Medical Association in a tour of Europe, April 5 to May 5, which will include visits to France, England, Italy, Holland, Belgium, Germany, and Switzerland and will offer opportunities to attend scientific meetings and meet medical leaders in several cities en route. Arrangements have been made for wives of physicians to attend style shows by Parisian couturiers and to participate in special entertainment.

Interested Texans should write immediately to the California Medical Association, 450 Sutter Street, San Francisco 8.

MANAGEMENT OF COMMON ANORECTAL CONDITIONS

With Special Emphasis on Prevention of Pain

R. HARVEY BELL, M. D., F.A.C.S., Palestine, Texas

THE patient with an anorectal condition requiring treatment is apprehensive if not actually afraid, and anything that will reduce or prevent his pain is greatly appreciated by him. The physician should not fail to spend sufficient time with the patient before examination or operation to reassure him and to explain that much of the pain in the anal region is caused by spasm of the sphincter muscles. The patient also can be told that he will have relief from pain or discomfort in the same degree that he is able to accomplish relaxation of the sphincters. In cases in which the patient cannot relax, less painful examinations can be made if the physician uses an anesthetic lubricating jelly instead of a plain one. A satisfactory anesthetic lubricating jelly is 5 per cent Intracaine in potassium yttrium or a similar jelly.

In the presence of a tight or spastic anus, the physician should use his little finger instead of his index finger for the digital examination. Examination of a fistulous tract can be done painlessly if the physician injects the tract with a 2.5 per cent Intracaine solution using a medicine dropper with a round bulb end instead of a sharp tip and if he leaves a small cotton tipped applicator dipped in the same solution in the tract for five to ten minutes before passing a probe into it. A good procedure is to prepare the patient for the examination, inject the tract with the anesthetic as described, and leave to examine another patient. When the physician returns, the tract will have become anesthetized and can be examined readily.

External Thrombotic Hemorrhoids.—External thrombotic hemorrhoids are common. If the patient is seen the first day or two after the clot forms and becomes firm, much later discomfort can be spared him. The lesion should be washed gently with soap and water using cotton rather than gauze to wipe the area. No shaving should be done. The region may be washed with a Zephiran Chloride solution, 1:1,000 strength. One stick of a small hypodermic needle is all that is necessary to anesthetize the mass with a procaine solution. An elliptic incision is made over the hemorrhoid and the clot removed completely. The bleeding point and cut edges are then desiccated with a uniterminal electric needle such as a Hyfrecator, and an anesthetic ointment such as Surfacaine is applied on a pledget of cotton. No further ointment dressings ordinarily are used since in a draining wound such as this quicker healing and less discomfort is had if wet dressings are used. My preference is to have the patient cleanse the wound several times a day with a 1:1,000 Zephiran Chloride solution and apply a small moist sponge or piece of cotton to the anus when there is discomfort or when the dressing drops off. If the physician does not have an electric needle, he may touch the skin edges lightly with fuming nitric acid with equally good pain control.

Internal and External Hemorrhoids.—Markedly less pain and associated bladder neck spasm will follow an operation for removal of internal and external hemorrhoids if the bleeding is stopped by using an electrocoagulating needle rather than by tying the bleeding points. The need for postoperative catheterization, therefore, will be much less. If the physician does not desiccate the skin edges, he should touch them lightly with nitric acid for pain prevention. Another procedure to lessen pain following hemorrhoidectomy is to have the patient soak in a tub of warm water for twenty to thirty minutes several times daily beginning the day after operation. If this plan is followed, the patient will require many less hypodermic injections to relieve pain and may not require any. It is not unusual for my patients to require no narcotics following hemorrhoidectomy, and all have standing orders for morphine when they have pain that disturbs their rest. Soaking in a tub is soothing and relaxing, and nearly all patients find it of much value during their convalescence.

Postoperative gas pains can be prevented in most patients by disturbing the bowels as little as possible prior to surgery and feeding the patient normally and fully immediately following surgery. The empty bowel forms the gas. No enema should be given the day of the operation; if one is given at all, it should be the day before operation and of small quantity using plain water. It is my usual practice not to give any preoperative enemas.

A piece of gauze, which can be removed before the patient leaves the operating room following surgery, should be placed in the rectum at the beginning of the operation to absorb blood. This will leave no

Read before the Section on General Practice, Texas Medical Association, Annual Session, Houston, April 29, 1953.

blood clot masses in the lower rectum to cause discomfort later. No gauze or rubber tissue should be left in the anus after operation to act as a drain or plug. Hemostasis should be complete before concluding the operation so that such agents are unnecessary.

The first bowel action following surgery will not be uncomfortable if a solution of 3 teaspoonsful of Hydrocil or Metamucil in a quart of warm water is injected into the bowel and allowed to remain until the patient has the urge for the bowels to act. The physician should use a well lubricated catheter and pass it himself rather than leave the procedure to an orderly.

Cryptitis and Papillitis.—Cryptitis and papillitis are managed similarly. Both require surgical removal of the lesions if they do not clear up promptly under conservative management of hot sitz baths. Treatment consists of injecting with a procaine solution, excising, and touching the wound and skin edges with either the desiccating needle or nitric acid. The wounds are kept clean with a Zephiran Chloride solution until healing is complete.

Fissure in Ano.—The fissure in ano is an elongated or slitlike ulcer in the lining of the anal skin at or above the anorectal line. It is characterized by paroxysmal pain usually brought on by defecation. Several methods of treatment may effect a cure, but excision of the ulcer accompanied by division of the superficial bundle of fibers of the external sphincter muscle, all under anesthesia, offers practically 100 per cent cure. Division of the sphincter adds materially to the postoperative comfort of the patient since it lessens the anal spasm. The skin edges should be touched with nitric acid or uniterminal current should be used as described previously. Postoperative care includes hot sitz baths. The operation may be done in the office and the patient allowed to go home for his sitz baths if the physician considers him a suitable patient for home care; otherwise, he should be hospitalized for a day or so.

Fistula in Ano.—Fistula in ano usually requires the complete removal of the fistulous tract to eradicate the condition. The tract or tracts usually pass external to the external sphincter muscle or between it and the internal sphincter so that division of the external sphincter muscle only is required. Care should be taken to divide the muscle at right angle to the direction of the muscle fibers and to divide it only in one place to preserve anal continence. The after care of the wound is very important. Packs should be removed entirely the first time they are disturbed, usually at about forty-eight hours postoperatively, and rarely replaced. Sitz baths are begun the day following operation and are continued two to four a day until the wound has healed. Pocketing is prevented by gently wiping the wound out to its bottom as often as necessary and by irrigating the wound with a 1:2,000 Zephiran Chloride solution. After a few days this becomes a painless procedure. A small wet Zephiran Chloride sponge dressing is placed over the wound and changed as often as necessary to maintain comfort. A Furacin dressing can be used for this wound. Neither Zephiran Chloride nor Furacin is irritating, but occasionally a patient is allergic to Furacin.

Pruritus Ani.—Pruritus ani is a condition in which many factors may play a part. Volumes have been written about its management. The physician must consider systemic causes, allergies, and local causes. Hemorrhoids, fissures, and fistulas are causes at times chiefly because of their irritating discharges. It is safe to say that in a large percentage of cases the offending agent is an irritant leaking from the anal canal; the neutralization or removal of this irritant will relieve the condition.

In milder cases simple cleansing with cotton wipes rather than paper and witch hazel applications on cotton swabs often will effect a cure. Alcohol injections, using 95 per cent strength, with a ¼ inch needle at ¼ inch intervals around the anus will cure some cases. The injections must be carried out under spinal, caudal, or general anesthesia since local anesthesia will dilute the alcohol. In severe cases I have found the best treatment to be an undercutting operation, usually clover leaf type. Then Oxycel or Gelfoam is placed beneath the skin and left until it has absorbed. All local conditions should be attended to prior to this part of the operation and all hypertrophied skin trimmed away smoothly.

Polyps.—Polyps require removal and fulguration of their bases. The physician must be careful not to tent the area and burn a hole in the bowel wall in this fulguration. Subsequent frequent periodic examinations should be carried out to be sure that there is no recurrence of the growth.

Anorectal Abscess.—Anorectal abscesses cause great pain and discomfort. In general the treatment consists of immediate wide incision and drainage. The incision should be anteroposterior or parallel to the anal slit; it should be made beyond the outermost fibers of the external sphincter muscle but as near the point of fluctuation as possible. Usually it is better to make the incision elliptic or triangular and large enough to assure adequate drainage. Much pain can be spared the patient after the operation if the abscess cavity is swabbed with nitric acid after opening it. Hot compresses and tub soaks will afford additional relief.

Proctalgia Fugax.—Proctalgia fugax is a well defined symptom complex of obscure etiology and pa-

thology. The pain is irregular and intermittent and appears to be 2 or 3 inches above the anal outlet. It is apparently a spasm of the internal sphincter muscle. There are possibly different trigger mechanisms in different persons affected with the condition. Sexual excitement seems to cause it in some persons at times; infection, vasospasm, venous stasis, allergy, and other factors cause it in others. The pain has been described as boring, gnawing, cramping, aching, and expanding. It usually does not last longer than fifteen to twenty minutes and may be less. Hot sitz baths, warm water enemas, firm application of pressure, and the assumption of various positions such as the knee-chest are pain relievers in some persons. It now has been found by several observers that nitroglycerine soluble tablets, grains 1/100 to 1/200, stop the attacks or modify them at once.

Carcinoma.—Carcinoma of the anus is mentioned here only to say that most cases of this condition require abdominoperineal resection because the lymphatic drainage of the anus spreads the disease. Lymphatic vessels below the anorectal line drain into the inguinal chain of glands, and those above this line drain into the median lumbar glands, which are high and far away from the site of the lesion. More than 77 per cent of cancer in the rectum and sigmoid colon can be felt by digital examination, and there is little excuse for missing cancer in this region.

SUMMARY

A plea is made for the physician to spend more time to reassure the patient with an anorectal condition and to explain to him more about the mechanics of the pain of his condition.

Some practical points regarding the lessening of pain or discomfort in examination and treatment of such common anorectal conditions as hemorrhoids, cryptitis, fissure in ano, fistula in ano, pruritus ani, polyps, anorectal abscesses, and proctalgia fugax are given.

Use of the uniterminal desiccating needle and of nitric acid applications is advocated in certain conditions.

ABSTRACT OF DISCUSSION

DR. HOLLAND T. JACKSON, Fort Worth: It is a well known fact that the patient with an anorectal condition is probably the most apprehensive of any patient with a common condition that we, as physicians, encounter. I certainly agree with Dr. Bell that reassurance on the part of the physician is a great aid for this patient. One of the most appreciative patients we encounter is the patient with thrombotic hemorrhoids. Simple removal of the thrombus usually gives the patient complete relief.

In the postoperative care of hemorrhoidectomies the sitz bath is probably one of the most valuable procedures. The idea of maintaining a full diet and amply full bowel to avoid stress is certainly good. Bulk laxatives by mouth are much better than enemas and, I think, better than the suggested enema as outlined by the essayist. In the management of cryptitis as well as fissure in ano, it has been my experience that usually some associated disease probably has necessitated hospitalization.

In fissure a complete cure is difficult unless the sphincter is divided. Pruritus ani continues as a challenge to the medical profession. It is important that all possible organic etiologic factors be considered and removed. It has been my experience that, in most of these instances, pruritus ani continues. The psychogenic factor in these cases never can be overlooked; it must be considered and the patient reassured as well as treated for the organic condition. After all apparent organic phenomena have been controlled and as a last resort before the surgical undermining operation, roentgen-ray therapy is a good agent for trial.

I have nothing to add in regard to the treatment of proctalgia fugax, but I do wish to reemphasize the importance of digital examination of all patients and certainly the importance of the sigmoidoscope for any patient who had the slightest suspicious history of a possible neoplasm of the lower bowel or rectum.

It is my opinion that it is not necessary to treat the wound edges with some desiccating agent but to establish adequate drainage and handle the tissues gently. This will cause far less pain than adding another pathologic process to the operative procedure. I wish also to stress the importance of cold compresses for twenty-four to thirty-six hours following the surgery. Cold gives far greater relief than warm applications during these early hours.

Regarding catheterization, despite what the doctor does, at least one catheterization is necessary in as many as 50 per cent of all male patients. And, again, let me stress the importance of biopsy of all suspicious lesions. It is important that the surgeon see that all tissue removed goes to a pathologist; then the pathologist should examine all the tissue submitted to him. Many times the tissue has gone to the pathologist but when he found it to be from a hemorrhoidectomy or something of that type, he has merely looked at the tissue grossly and reported it hemorrhoidal tissue. This type of attitude should be avoided.

FACTOR U COMPLICATES BLOOD TRANSFUSIONS

A new common factor in blood, designated as factor U, which causes blood to clump and complicate transfusion, is described by Dr. A. S. Wiener, Dr. L. J. Unger, and E. B. Gordon, all of Brooklyn, in the December 19 *Journal of the American Medical Association.*

Tests of the blood of a Negro patient who died following a blood transfusion for bleeding peptic ulcer and anemia and of the blood of the donors indicated that the patient's serum contained an abnormal antibody that caused the blood cells of the donors to clump together upon transfusion. Further tests with the serum on a series of other blood specimens showed them all to be incompatible. This indicated the presence in a high frequency of the population of a hitherto unknown factor which was lacking in the patient's blood, the report points out.

In additional tests on 690 Caucasoid and 425 Negroid persons, all of the Caucasoids were found to have the new factor U in their blood, whereas 4 of the Negroids were found lacking in it.

CASE REPORTS

MASSIVE SMALL BOWEL RESECTION IN POSTGASTRECTOMY PATIENTS

Report of 2 Cases

ELVIN L. SHELTON, JR., M.D., F.A.C.S., and M. H. BLAINE, M.D.,
Houston, Texas

EXTENSIVE small bowel resection is by no means a rare operation. In 1880, Koeberly removed 205 cm. of small bowel from a 22 year old woman.[8] In 1912, Flint[6] found more than 58 cases reported in which more than 200 cm. had been resected. Today there are many such case reports, but we were able to find only 2 instances in which even short-term survival had followed resection of the small bowel in a patient who previously had had a gastrectomy. Weckesser, Chinn, Scott, and Price[19] reported 1 such case; the patient lived for nine months with 24 to 30 inches of small bowel between the remaining portion of his stomach and his ileocecal valve.[19] This patient died apparently of inanition. Johnston and Reagan[10] recently reported a similar case in which the patient had extensive enterectomy three and one-half months after subtotal gastrectomy. Approximately 17.5 cm. of small bowel remained distal to the gastrojejunostomy. Inanition and reactivation of an old pulmonary tuberculous condition in the patient caused death five months after his second operation.

Since the combination of extensive enterectomy and gastrectomy in the same patient is so unusual, we wish to report 2 such cases.

CASE REPORTS

CASE 1.—The patient was a poorly nourished Negro man who appeared ten years older than the stated age of 58. A subtotal gastrectomy with a Hofmeister-type retrocolic gastrojejunostomy was performed on the patient October 2, 1950, because of almost complete pyloric obstruction secondary to a duodenal ulcer of approximately twenty years' duration.

On January 9, 1951, three months after his operation, the patient was seen for a complaint of mild periumbilical, cramping pain which subsided within a few hours.

On April 5, the patient again returned to the hospital. For two or three weeks he had noted dizziness and weakness following meals. Lying down would give the patient some relief, especially if he was able to vomit or "belch up" a small amount of gastric contents. On the evening of admission he had belched up about a cupful of "thin black blood." His bowel habits had remained normal.

From the Department of Surgery, Baylor University College of Medicine, and the Veterans Administration Hospital.

Read before the Section on Surgery, Texas Medical Association, Annual Session, Houston, April 29, 1953.

The patient appeared critically ill and was able to give only a fair history. He was stuporous, cold, and sweating and had a weak pulse of 89 per minute, a temperature of 98 F., and a blood pressure of 80/0 mm. of mercury. His abdomen was moderately distended but only slightly tender throughout. Peristalsis was hypoactive.

Laboratory studies were normal except for a leukocytosis of 18,100.

Flat and upright roentgenograms of the abdomen showed dilated loops of small intestine containing fluid levels, suggesting intestinal obstruction.

The patient was given 3,000 cc. of blood during the next ten hours. His general condition improved, but his abdomen became tenderer. He was scheduled for an exploratory laparotomy with a preoperative diagnosis of intestinal obstruction secondary to adhesions.

A right paramedian incision was made, and when the peritoneum was opened, many loops of markedly distended, black, gangrenous small bowel were extruded. Approximately 400 cc. of malodorous, thin, brownish fluid was aspirated from the peritoneal cavity. It was noted that the entire small bowel and its mesentery had rotated approximately 360 degrees in a counterclockwise direction. The volvulus was reduced, revealing no adhesive band or other abnormality which might have encouraged the volvulus. All the small bowel except the 26 inches just distal to the gastrojejunostomy and the 2 inches proximal to the ileocecal valve was gangrenous (fig. 1a). A resection of the nonviable bowel and a two-layer, end-to-end entero-enterostomy was accomplished without delay, and the incision was closed. The patient received 2,500 cc. of blood during the operation, and his condition remained remarkably stable.

The immediate postoperative course of the patient was satisfactory. By the ninth postoperative day he was taking a high carbohydrate, medium protein, low fat diet with frequent small feedings, and it became obvious that he would be a nutritional problem. He was having five to seven semiliquid stools daily, the stools being of a greasy, foamy nature and containing undigested food. The urge to defecate followed shortly the ingestion of food. Carmine red given by mouth was detectable in the stool seventeen minutes later. Barium by mouth was seen by fluoroscopy to reach the ileocecal region in three minutes.

The patient's weight dropped from 128 pounds on admission to the hospital on April 5 to 110 pounds on May 20. He then gradually gained to 118 pounds and stabilized at that weight within a month, a rather typical course for this type of patient.

Bismuth subcarbonate and paregoric were given frequently in an effort to lessen bowel motility and decrease the diarrhea. Ammonium chloride and calcium lactate were given

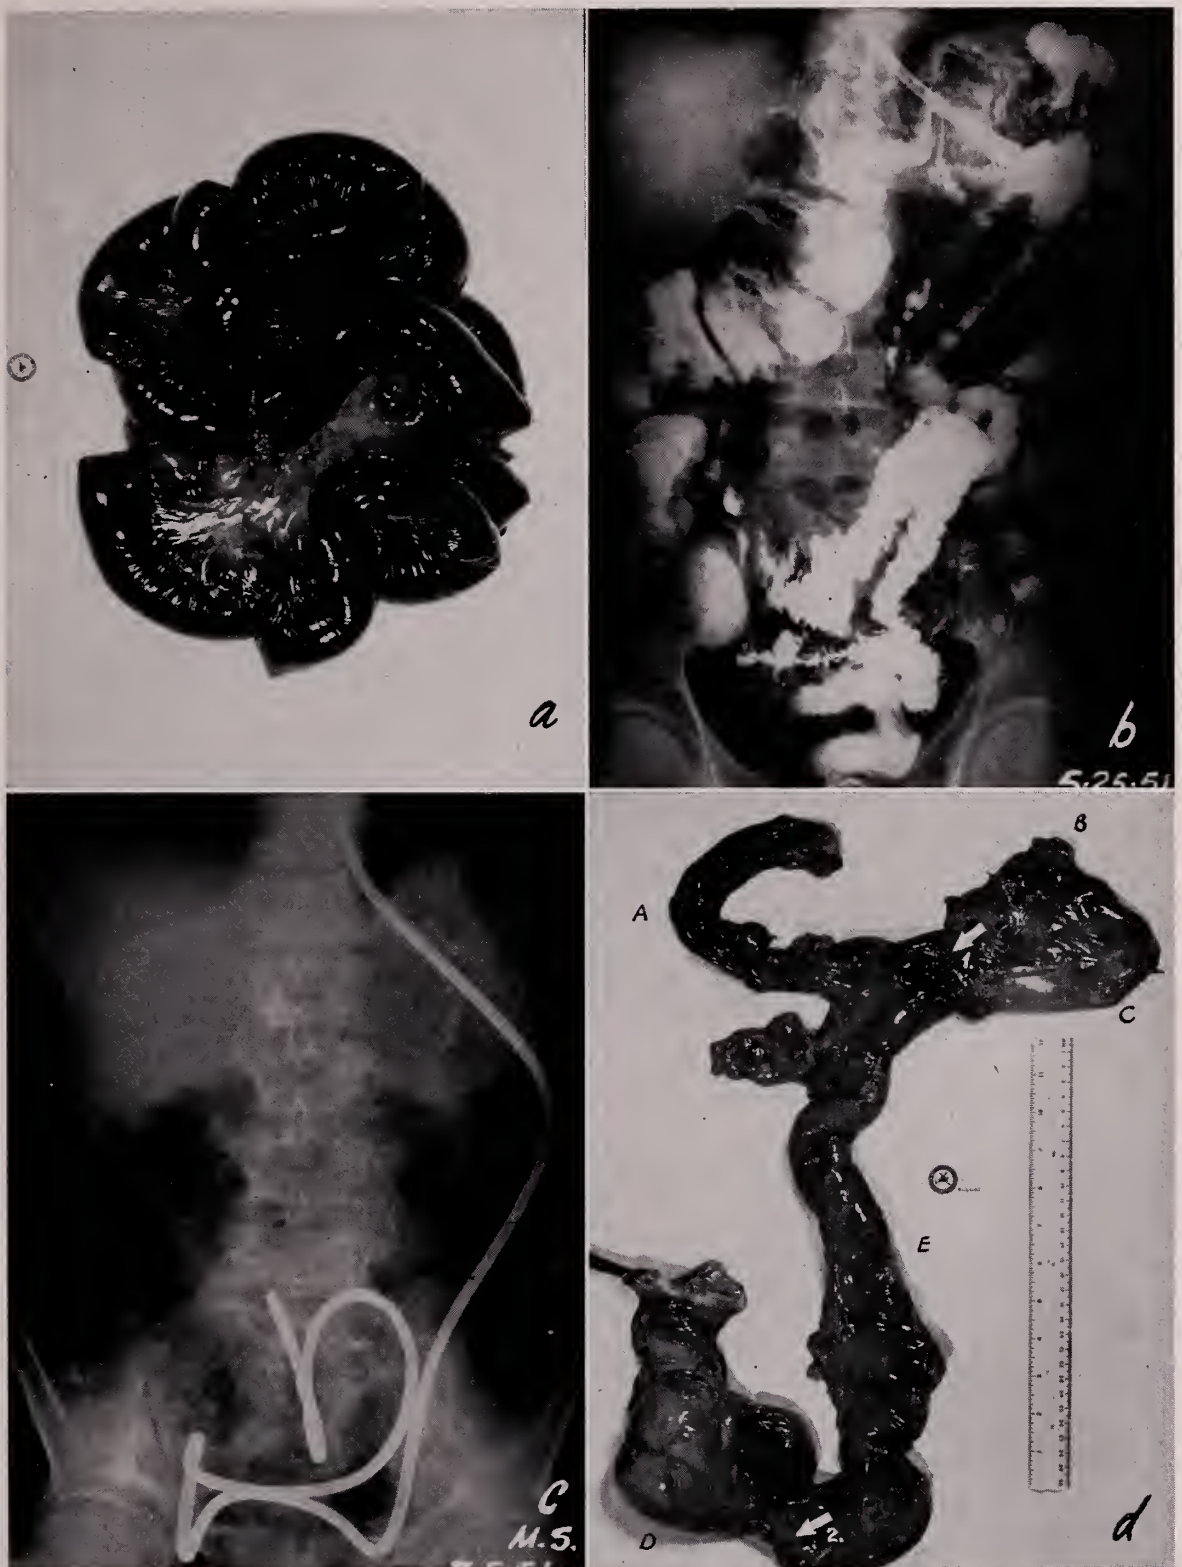

FIG. 1. Case 1. a. Gangrenous small bowel resected April 6, 1951.

b. A barium study May 25 after small bowel resection shows some barium remaining in the stomach; the entire extent of the small intestine can be outlined vaguely.

c. A roentgenogram made sometime later shows the distal end of the Miller-Abbott tube apparently at the ileocecal valve. Repeated efforts failed to advance the tube farther.

d. Autopsy specimen showing (*A*) duodenum, (*B*) short esophageal segment, (*C*) entire stomach, (*D*) cecum, and (*E*) entire length of small bowel. Arrow 1 points to a perforated ulcer, and arrow 2 indicates the site of an old enteroenterostomy.

to facilitate the absorption and utilization of calcium. Ascorbic acid, crude liver extract, vitamin B complex, and vitamin K were administered parenterally to forestall vitamin deficiencies and anemia. Repeated blood chemistry examinations were done, and at no time prior to the patient's temporary discharge from the hospital July 15, 1951, did the blood urea nitrogen, total blood cholesterol, blood sugar, total serum protein, serum albumin-globulin ratio, serum chlorides, serum amylase, blood carbon dioxide combining power, blood calcium, serum sodium, or serum potassium show anything but normal variation. A gastrointestinal series

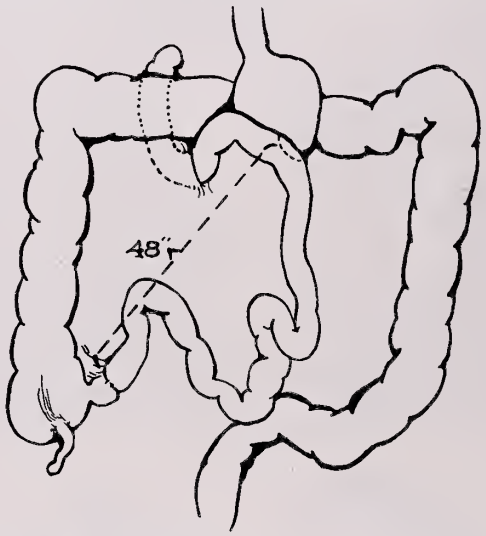

FIG. 2. Case 2. Diagram of the reconstructed gastrointestinal tract following massive small bowel resection.

on May 25 showed filling of the entire intestinal tract and revealed no abnormality (fig. 1b and c).

The patient was seen frequently until August 20, 1951. On that date he weighed 121 pounds and appeared in good health. He then failed to return for routine examination and was not seen again until February 9, 1952. Eight days previously his bowels had failed to move, and he considered this especially significant since he usually had several bowel actions daily. He developed a mild distention and vomited once before admission to the hospital.

On physical examination the patient was found to be markedly dehydrated, poorly nourished, and chronically ill. His temperature was 100 F.; the pulse feeble, 120 per minute; and the blood pressure 80/0 mm. of mercury. The abdomen was distended, tympanitic, and silent. There was mild, generalized abdominal tenderness without rigidity.

A roentgenogram of the abdomen was not remarkable. The leukocyte count was 9,100 with a normal differential. The hemoglobin was 9.7 Gm. with an erythrocyte count of 3,200,000.

The unusual findings were a serum protein level of 3.1 Gm. per 100 cc., a serum chloride level of 86 milliequivalents per liter, a serum potassium level of 1.4 milliequivalents per liter, a serum sodium level of 133 milliequivalents per liter, and a blood calcium level of 2.9 milliequivalents per liter.

A vigorous but unsuccessful attempt was made to correct the fluid and electrolyte imbalance, but the patient's condition grew progressively worse, and he died on the fifth day in the hospital.

Postmortem examination revealed a generalized, purulent peritonitis secondary to a large perforated jejunal ulcer at the margin of the gastrojejunostomy. The entire segment of small bowel excluding the afferent loop measured 70 cm. (28 inches), and no compensatory hypertrophy had occurred as has been noted in other cases (fig. 1d).

CASE 2.—The second case has one or two interesting differences from the first. The patient was a much younger and healthier man from the beginning. He had a high subtotal gastrectomy with a Hofmeister-type antecolic gastrojejunostomy performed on January 31, 1952, for a chronic duodenal ulcer that had perforated on three separate occasions in the preceding ten years.

On May 4, 1952, the patient returned to the hospital with a note from his family physician stating that the patient had suffered several attacks of what appeared to be incomplete intestinal obstruction. The night before admission an attack more severe than usual had begun and had not relented. He had vomited several times.

Physical examination revealed a well developed but thin patient in good general condition but in moderate distress. The abdomen was tender throughout but not distended. There was definite rigidity.

There was a leukocytosis of 19,850 white cells per cubic millimeter. All other laboratory findings were normal. A roentgenogram showed small bowel distention with fluid levels and no free air.

The patient was operated upon, the findings at surgery being similar to the preceding case. Approximately 120 cm. (48 inches) of jejunum distal to the gastrojejunostomy was viable and only 5 cm. (2 inches) of ileum just proximal to the ileocecal valve was viable. An end-to-end enteroenterostomy was accomplished after quick resection of the gangrenous bowel (fig. 2). Many adhesions secondary to the previous operations were noted.

This patient had a gratifying convalescence. By May 10, he was passing flatus. When given a full diet, he had approximately ten stools a day. He ate well and gained 4 pounds in one week. He was discharged in good condition May 26.

A gastrointestinal series on August 22 showed unusually slow progression of the head of the column of barium. At four hours all the column had reached the cecum (fig. 3). It is likely that the patient had multiple adhesions which slowed the passage of barium, perhaps accounting for his good nutritional status despite the minimal amount of small intestine remaining.

The hemogram and blood chemistry results have remained normal. The patient's weight has maintained at about 130 pounds compared with his usual weight of 160 pounds.

DISCUSSION

It appears definite now that our second patient will not succumb from the effects of his extensive enterectomy. He never presented the serious nutritional problem which we expected from our experience with the first patient. There may be several reasons for this. He was twenty years younger and in better physical condition prior to his operation than the patient of case 1. He was decidedly more cooperative and has followed dietary restrictions well. Very likely his meals at home have been more nutritious. One also might conclude that the 48 inches of small bowel exceeds slightly the minimum amount necessary to maintain

life whereas the 28 inches remaining in the first patient was perhaps short of the minimum requirement.

Where is this critical point? It is interesting to note that in 1912, Flint[6] was trying to answer the same question. He said, "In these days of aggressive surgery, it is important to know the limits of resection of various organs and tissues. . . ."[6] After extensive experiments on dogs, he estimated that 50 per cent of the small intestine could be resected and good health be maintained. Prioleau[17] in 1944 agreed with that estimation. Perhaps the required amount of functioning small bowel is somewhat less than 50 per cent, but Meyer,[13] Johnston and associates,[10] and others[1,11,13,17] have noted that although survival is possible after more extensive resections, the patient loses weight which he never regains and does not have perfect health thereafter.

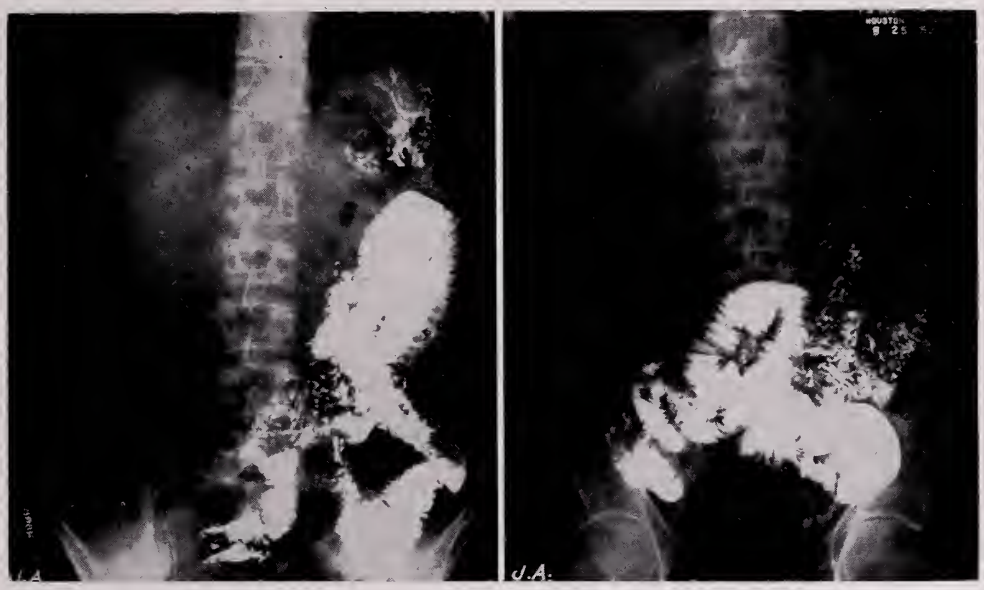

FIG. 3. Case 2. Gastrointestinal series three months after small bowel resection. *Left:* Roentgenogram made at one hour shows barium in the stomach and proximal one-third of the small bowel. *Right:* Roentgenogram at two hours shows barium in the cecum and faintly throughout the entire extent of the small bowel. The slow progression of barium is not explained.

It has been interesting to speculate how much the previous gastrectomy affected our 2 patients. The small intestine is the most important part of the gastrointestinal tract from the standpoint of physiologic function.[11] As we know, the small intestine can assume the function of the stomach or colon when necessary, but for adequate digestion it needs assistance, and certainly in these 2 patients it would have been desirable to have a large normal stomach with a pyloric sphincter and a duodenum that had not been short-circuited. Under such conditions the ingested food would have been churned, partially digested, and acidified. This process would have initiated the breakdown of all foods and prepared them for further digestion and absorption in the acid medium.[12] Without the normal stomach and the sphincter, the food dropped almost immediately into the alkaline jejunum, progressed rapidly, and in case 1 had reached the colon in only a few minutes. It might be assumed that this patient would be living now had he not lost most of his stomach earlier.

Flint's experimental work on dogs in 1912 indicated that, following extensive enterectomy, a compensatory process consisting of a hypertrophy as well as hyperplasia of the remaining portion of the small intestine occurred. It seemed probable to him that "in favorable cases approximately the original epithelial area of the intestine is restored by the hypertrophic process."[6] Similarly, Coleman and Bennet[4] believed that postoperatively the rate of absorption proximal to the resection becomes twice the normal rate. The slight weight gain after an initial loss in case 1 suggests that the patient probably did benefit from increased absorption. Autopsy findings, however, showed a distinct failure of the remaining jejunum to increase in diameter or length. It has not been possible yet to confirm any changes which may have occurred in case 2, but the patient's good general condition at present possibly may be attributed to such changes.

SUMMARY

Extensive enterectomies in postgastrectomy patients must be rare. A careful search of the medical literature revealed reports of only 2 previous cases.

We report 2 cases of our own, 1 with a ten month survival and the other being alive and well almost twelve months postoperatively. The autopsy findings in case 1 are presented.

The probable effect of the previous gastrectomy on the nutrition of the 2 patients is discussed.

Our patients conform to the pattern of other similar cases reported regarding persistently frequent soft stools, a lower weight level plateau, and a tendency to improve gradually with time. However, autopsy findings in case 1 did not show compensatory hypertrophy or hyperplasia of the remaining small bowel which others have felt occurred.

ADDENDUM

As of January 1, 1954, the second patient is living and well.

The authors wish to express their gratitude to Mrs. Ella S. Breckenridge and the Medical Illustration Laboratory, Veterans Administration Hospital, Houston, for the preparation of the illustrations in this article.

Dr. Blaine, Veterans Administration Center, Temple, Texas.

ABSTRACT OF DISCUSSION

DR. DENTON A. COOLEY, Houston: In 1951, I reported a case of a 52 year old housewife who six years previously had undergone gastric resection with inadvertent gastroileostomy.* Diagnosis of the condition had not been made previously although multiple barium studies had been done. Not until a Miller-Abbott tube was passed from the gastric pouch directly into the colon was the radiologic appearance explained. Subsequent laparotomy revealed that the gastrointestinal anastomosis had been done 18 inches from the ileocecal junction. A short bowel syndrome, similar to those reported by Dr. Shelton, was thus available for study after a prolonged period of progressive deterioration of the patient.

The most striking feature in my case was the appearance of spontaneous fractures involving the left clavicle, right radius, and multiple ribs. Serum calcium measured 8.1 mg. per 100 cc., which in the presence of a total serum protein level of 4.0 Gm. per 100 cc. was well above tetanic levels. Serum phosphorus was 1.8 mg. per 100 cc., and the alkaline phosphate was 29.4 Bodansky units. Thus the chemical pattern was similar to that of juvenile rickets or adult osteomalacia. The fact that the serum phosphorus increased to 3.5 mg. per 100 cc. with massive doses of calciferol indicated that a deficit of vitamin D, a fat soluble vitamin, was the cause of the osseous decalcification. Soon after correction of the gastroileostomy, the fractures healed, and the patient has completely recovered. Perhaps Dr. Shelton should give his patient a larger dose of the fat soluble vitamins.

DR. ALANDO J. BALLANTYNE, Houston: The problem of maintenance of nutrition after resection of various portions of the gastrointestinal tract is an interesting study in applied physiology. Studies such as those reported in Dr. Shelton's paper indicate that our knowledge of gastrointestinal physiology is far from complete, particularly in relation to the amount of compensation that can occur in the face of extensive resections. Furthermore, it would seem that inferences from animal studies regarding the amount of intestine that can be resected with survival cannot be directly applied to human material. Some animal studies also tend to show that resection of the jejunum is tolerated better than resection of the ileum, but Dr. Shelton reports that reasonable nutrition is possible after resection of the entire ileum, most of the jejunum, and even the right colon.

After extensive subtotal gastric resections, gastrointestinal physiology is altered, and there may be nutritional disturbances resulting therefrom. The most apparent alteration is the loss of much of the reservoir function of the stomach with a resultant more rapid filling of the jejunum with material which has not been processed by the stomach. The material reaching the jejunum does not have what is considered to be an optimum hydrogen ion concentration, osmotic concentration, or fluidity. These changes and the absence of the normal controls of gastric emptying lead to an increased hurry of the intestinal contents in the upper jejunum and in some instances through the entire small bowel. Deficiencies in absorption may result, particularly in the absorption of fat, and subclinical steatorrhea is common after subtotal gastrectomy. There are also perhaps deficiencies in absorption of iron and vitamins resulting from this derangement in physiology, but usually these deficiencies are less apparent clinically.

When a considerable loss of absorptive surface resulting from massive intestinal resection is added to the defects produced by subtotal gastrectomy, a situation in which nutri-

*Cooley, D. A., and Hartmann, R. C.: *Inadvertent Gastro-Ileostomy: Successful Operative Correction Six Years After Gastrectomy, Bull. Johns Hopkins Hosp.* 89:133-142 (Aug.) 1951.

tional problems are likely to develop is present. With only a small segment of small bowel remaining, absorption of carbohydrate is ordinarily good, protein is absorbed fairly well, and fat is absorbed poorly. Chlorides, sodium, and potassium seem to be absorbed reasonably well. The absorption of adequate amounts of calcium is more difficult. Calcium is absorbed chiefly from the upper small intestine where its rate af absorption is influenced chiefly by the hydrogen ion concentration, the amount of phosphates and fat in the diet, and the presence of vitamin D. In patients who have undergone gastrectomy and have minimal small bowel remaining and who are losing large amounts of fatty acids, conditions for calcium absorption are about as poor as could be imagined. It is interesting that in Dr. Shelton's first patient during the final admission to the hospital the blood calcium was 5.8 mg. per 100 cc. and yet clinical tetany was not present. Had vomiting been prolonged sufficiently to result in alkalosis, tetany certainly should have occurred. The other findings of marked hypoproteinemia and anemia are fairly characteristic of the findings reported in the literature in the terminal phases of these nutritional problems.

What can be done to improve the nutrition of these patients? A diet rich in carbohydrate, medium in protein, and low in fat given in frequent feedings seems to be tolerated best. The use of Tweens-80 to facilitate the absorption of fat has met with indifferent success. Hexamethonium bromide taken before each meal has been said to facilitate the absorption of fat in some patients after gastrectomy, but I have seen no reports of its use after massive small bowel resection. Theoretically, the administration of synthetic diets containing amino acids should result in better utilization of ingested protein; but in the reports with which I am familiar, there has been a better utilization percentagewise of whole protein, and patients will not follow a synthetic diet long enough for extensive studies.

When a surgeon is faced with the problem of resecting the small intestine in such quantity that the remaining absorptive surface seems inadequate to sustain life, he can be comforted by the fact, pointed out by Drs. Shelton and Blaine, that other surgeons have living patients who have had most of the stomach as well as most of the small bowel removed and yet maintain a reasonable state of nutrition. We can hope that in the future new facts may be uncovered which will lead to an improvement in the nutritional state.

Ulcerative Colitis with Sarcoid-Like Lesions Treated by Total Colectomy

REPORT OF A CASE

JOHN A. HART, M.D., F.A.C.S., Beaumont, Texas

THERE are many forms of ulcerative colitis, but the term is best used to denote a clinico-pathologic syndrome. This syndrome may develop as a result of infection by one or more of several bacteria or animal parasites.

Thromboulcerative colitis accounts for about 66 per cent of such cases. It often appears in the second or third decade of life and is characterized by periods of exacerbation and remission. However, the tendency is to progression and extension. It usually begins in the rectum or lower colon and tends to spread upward and involve the entire colon and even the terminal ileum. Perirectal abscesses and ulcers frequently are complications.

The pathologic changes as described by Bargen[1] begin in the wall of the colon as a thrombosis of the capillaries. Edema, miliary abscesses, and ulcers appear as the mucosa is secondarily involved. Fibrosis and uniform strictures follow and result in pseudopolyposis. In the acute phase fever and all the symptoms of intense toxemia are present. Severe diarrhea with passage of purulent hemorrhagic exudate ensues. Death frequently occurs as the result of the fulminating toxemia or from perforation or peritonitis.

The case herein reported followed this pattern and differs only in the pathologic findings in the resected specimen.

CASE REPORT

J. M., an only child, adopted, family history unknown, developed signs of rickets at the age of 6 months. He slept at only short intervals as a baby. He developed nervous tics at the age of 3 years. He was extremely nervous in school and made very poor grades.

In 1947, at the age of 17, the patient developed a chronic cough, began losing weight, and suffered from frequent loose stools. He became lethargic and began to run a low grade fever. No definite diagnosis was made, but he was treated with long courses of sulfonamides, penicillin, and streptomycin. The condition progressed and he began passing purulent and hemorrhagic stools. A diagnosis of ulcerative colitis was made in 1949. The patient was sent through two excellent clinics in neighboring medical centers where repeated cultures, acid-fast stains, and animal inoculation revealed no causative organisms. However, it was suspected by physicians at one of the clinics that the cause was a fungus infection. Subsequently the patient developed multiple perianal abscesses and ulcers. These were operated upon but resisted all treatment. Multiple tender subcutaneous nodules appeared in the lower extremities. The patient's weight, normally about 140 pounds, declined to around 90 pounds. In 1950 he was given Aureomycin and improved rapidly. The fever and diarrhea subsided, the perianal ulcers healed, and normal weight was regained. However, the stools remained semisoft and liquid. The patient remained in fairly good health until 1952, when all symptoms re-

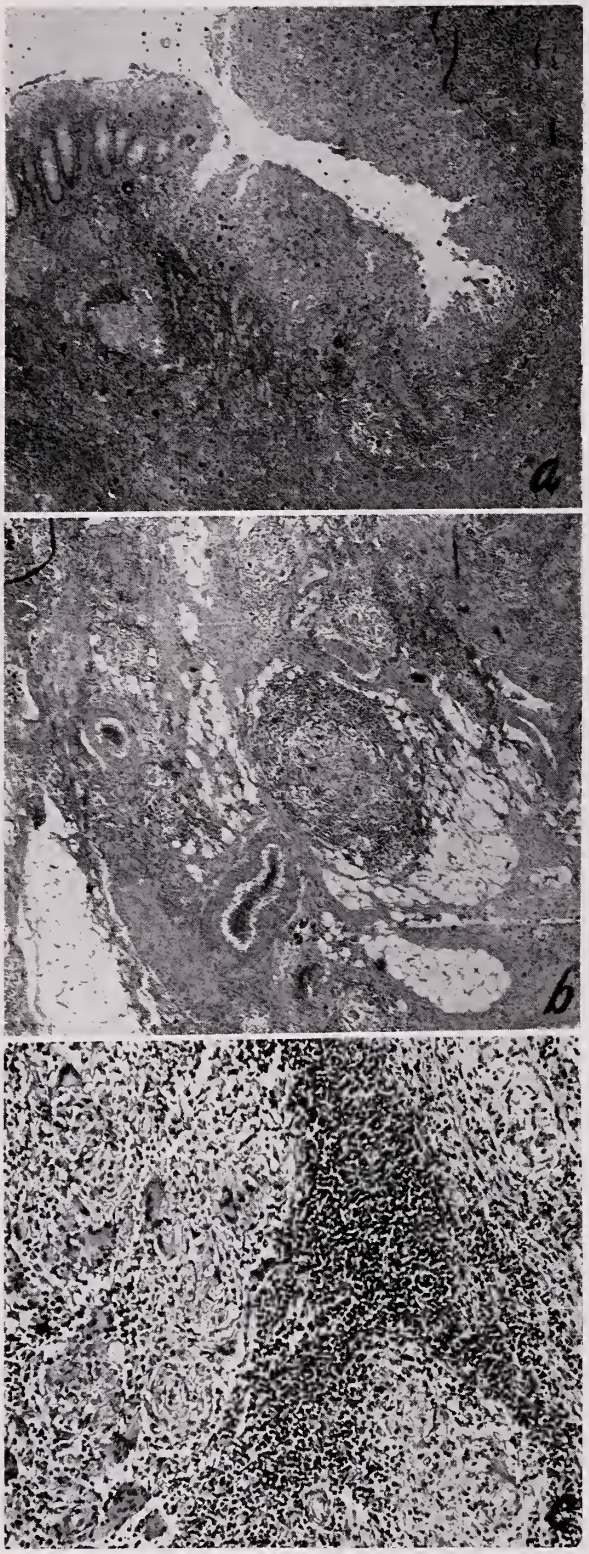

FIG. 1a. Photomicrograph of a section through an ulcerating crypt in a field showing the nonspecific chronic picture usually observed in chronic ulcerative colitis. x 26.

b. Section showing a tuberculoid granulomatous focus occupying an island of adipose tissue and located immediately outside the serosa of the colon. Note the giant cells. x 26.

c. High power view of a granulomatous area similar to *b*. A typical noncaseating tubercle is shown.

turned. Multiple perianal ulcers and abscesses recurred. There was no improvement with Aureomycin or sulfa drugs. Again body weight declined to 90 pounds.

June 21, 1952, a Cattell[2] type of ileostomy was done under light Pentothal and local anesthesia. The postoperative course was stormy and manifested by repeated attacks of gastric dilatation and obstructive symptoms with little drainage through the ileostomy tube. These signs of obstruction were relieved when a colon tube was passed about 20 cm. up the ileum through the ileostomy. The double-barrel ileostomy as described by Cattell creates a pocket between the two loops of the ileum and the anterior abdominal wall through which the ileum can herniate. This complication was thought to be the cause of the obstruction.

The skin for about 12 cm. around the ileostomy was covered with a thick, sticky paste, as advised by Ladd and Gross,[3] which prevented all irritation. The wound healed cleanly, and twelve days postoperatively measurements were taken for a Koenig Rutzen ileostomy bag. This was applied three weeks after ileostomy. If the ileostomy opening projects 1½ inches above the skin, the intestinal contents will be discharged directly into the bag, which is glued to the skin and cannot slip.

The patient felt well and gained about 15 pounds in weight but continued to have diarrhea with passage of a purulent hemorrhagic exudate. There was no evidence of healing of the perianal ulcers.

The patient was rehospitalized and given transfusions. Ten grams of Sulfasuxidine was instilled in the colon through the distal end of the ileum each day for five days prior to colectomy. On January 5, 1953, with spinal anesthesia, through a long left paramedian incision, the distal end of the terminal ileum was excised from the abdominal wall and total colectomy was performed in one stage. A wide incision around the anus was necessary to excise the deep perineal ulcers.

Pathologic Report.—Dr. H. W. Neidhardt, the pathologist who examined the surgical specimen, diagnosed the condition as chronic ulcerative colitis with an unusual superimposed sarcoid-like type of lesion and an appendix showing granulomatous inflammation.

The entire colon showed extensive ulcerations of the mucosa so that in most of the areas there were typical "islands" of mucosa (pseudopolyps). The transverse and descending portion of the colon showed particularly severe involvement with beginning fibrosis of the wall. The cecum showed the least degree of involvement and the small portion of terminal ileum no involvement. The transverse mesocolon showed innumerable enlarged lymph nodes. No areas were suggestive of malignant changes.

Numerous sections taken through the colon microscopically showed extensive ulceration of the mucosa. These ulcers were filled with granulation tissue containing a great many macrophages and newly formed capillaries. There was a dense infiltration with lymphocytes and numerous foreign body type, multinucleated giant cells which are often associated with typical epithelioid noncaseating tubercles such as are seen in sarcoidosis. The granulomatous foci were usually evident in the submucosal part of the colon, but also appeared sometimes as deep as or within the muscularis. The serosa, however, was never involved. Sections through regional lymph nodes suggested sarcoidosis. Sections through the appendix were striking in that the submucosal lymphoid tissue was replete with this same type of tubercle, but without evidence of ulceration. The lesions at the mucocutaneous junction were very severe and the ulcerations unusually deep. Sections through the ileum

showed nothing remarkable. Special stains (periodic-Schiff) were done to demonstrate fungi; however, no fungi were observed. It was postulated that the multiple granulomatous lesions may have been a result of a superimposed fungus infection upon what was otherwise a classical example of chronic ulcerative colitis. The sarcoid-like picture encountered throughout this specimen was difficult to explain. Acid-fast stains were negative.

Postoperative Course.—The postoperative course was smooth. Active peristalsis was noted in the second day with passage of frequent liquid stools. The patient was taking liquid diet on the third day and allowed to be up. The wound healed by primary union. The patient was discharged on the fourteenth postoperative day on a full diet.

Nine months after the colectomy, the patient was doing manual labor, had gained 40 pounds in weight, and had a soft to firm stool once daily.

DISCUSSION

To my knowledge no other cases of chronic ulcerative colitis have displayed this singular pathologic lesion and one may reasonably wonder if the administration of antibiotics over a prolonged period would favor a fungus infection which would account for the granulomatous tissue reaction observed here.

Sommers and others[5] have failed to confirm the contention of some authors[4] that an important histologic alteration in chronic ulcerative colitis is a "basement membrane deficiency" supposedly demonstrated by using the periodic-Schiff reaction.

Since the periodic-Schiff reaction was used in the study of the present case, the sections were reviewed with special attention to basement membrane alteration. No conclusive evidence of such changes could be found.

SUMMARY

A case of chronic ulcerative colitis presenting sarcoid-like lesions in a constitutionally inferior patient was treated by total colectomy. The obstruction from internal herniation which can follow the Cattell type of ileostomy was relieved by high insertion of a colon tube. The Koenig Rutzen bag has robbed ileostomy of its horrors.

Texas Society of Pathologists, San Antonio, May 3, 1954. Dr. John J. Andujar, Fort Worth, Pres.; Dr. Lloyd R. Hershberger, Shannon Memorial Hospital, San Angelo, Secy.

Texas Surgical Society, Waco, April 5-6, 1954. Dr. Dudley Jackson, Sr., San Antonio, Pres.; Dr. Albert W. Hartman, 414 Navarro St., San Antonio 5, Secy.

Texas Tuberculosis Association, Dallas, April 9-10, 1954. Dr. R. G. McCorkle, San Antonio, Pres.; Miss Pansy Nichols, 208 E. Ninth, Austin, Executive Secy.

Texas Urological Society, Fort Worth, Feb. 22, 1954. Dr. J. Reese Blundell, Houston, Pres.; Dr. Dolphus E. Compere, 1415 Pennsylvania Ave., Fort Worth, Secy.

DISTRICT

First District Society, Pecos, Feb. 12, 1954. Dr. John W. O'Donnell, Alpine, Pres.; Dr. H. D. Garrett, First National Bldg., El Paso, Secy.

Second District Society, Sweetwater, April 15, 1954. Dr. T. D. Young, Sweetwater, Pres.; Dr. Francis Hood, Sweetwater, Secy.

Third District Society, Amarillo, April 13, 1954. Dr. Robert A. Neblett, Canyon, Pres.; Dr. James T. Hall, 1626 Fifteenth St., Lubbock, Secy.

Fourth District Society, San Angelo, Fall, 1954. Dr. P. M. Wheelis, Brownwood, Pres.; Dr. James N. White, San Angelo, Secy.

Fifth and Sixth Districts Society, Corpus Christi, July, 1954. Dr. Y. C. Smith, Sr., Corpus Christi, Pres.; Dr. Robert J. Sigler, 1126 Third Street, Corpus Christi, Secy.

Seventh District Society, Austin, Feb. 18, 1954. Dr. Benjamin Clary Bates, Austin, Pres.; Dr. William McLean, 4618 Burnet Road, Austin, Secy.

Eighth District Society. Dr. Howard Z. Fretz, Wharton, Pres.; Dr. George E. Glover, Jr., Victoria, Secy.

Ninth District Society, Brenham, March 25, 1954. Dr. George D. Bruce, Baytown, Pres.; Dr. Lyman C. Blair, 1212 Rothwell, Houston, Secy.

Tenth District Medical Society. Dr. Edmund D. Jones, Beaumont, Pres.; Dr. O. W. Harris, Jr., Liberty, Secy.

Eleventh District Society, Crockett, Spring, 1954. Dr. John Dean, Crockett, Pres.; Dr. Marlin T. Braswell, Henderson, Secy.

Twelfth District Society, Corsicana, July 13, 1954. Dr. Neil Buie, Marlin, Pres.; Dr. Paul H. Mitchell, Corsicana, Secy.

Thirteenth District Society, Fort Worth, March 24, 1954. Dr. William E. Crump, Wichita Falls, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteenth District Society, Denton, 1954. Dr. J. W. Atchison, Gainesville, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Longview, April 20, 1954. Dr. Bain Leake, Gladewater, Pres.; Dr. George Tate, Longview, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 15-18, 1954. Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco, April 7, 1954. Dr. Walter B. King, 2320 Columbus Ave., Waco, Secy.

International Medical Assembly of Southwest Texas, San Antonio, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 8-11, 1954. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference. Dr. C. H. Wilson, Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas, July 19-21, 1954. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, March 31, 1954. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

PERSONALS

"Experiences with the Palmer Open Reduction of Os Calcis Fractures" was the title of a paper presented by *Dr. Jack E. Maxfield* and *Dr. Frederick J. McDermott,* Wichita Falls, at the annual meeting of the American Academy of Orthopedic Surgeons January 23-28 in Chicago.

At the meeting of the American Academy of Obstetrics and Gynecology in Cincinnati on December 14, *Dr. William F. Mengert,* head of the Department of Obstetrics and Gynecology at Southwestern Medical School of the University of Texas, Dallas, was elected president-elect rather than president as reported in the January JOURNAL.

Dr. A. Ford Wolf, Temple, recently was elected secretary-treasurer of the allergy section of the Southern Medical Association.

Dr. William E. Morris was recently selected as the "Outstanding Young Man" in Corpus Christi for 1953.

A dinner was held in Jacksonville to honor *Dr. R. T. Travis* in November, on the eve of the formal open house for the new Nan Travis Memorial Hospital. Dr. Travis was presented with a gold engraved watch and a hat as well as the announcement that the Travis Clinic would sponsor an annual lecture in his honor.

A thirty-year service pin was awarded to *Dr. L. M. Cochran,* Temple, manager of the McCloskey Veterans Administration Center, during the employees' incentive awards program in October. The pin was presented by *Dr. C. R. Miller,* manager of the Veterans Administration Hospital at Marlin and a lifelong friend of Dr. Cochran.

The people of Sanger in November elected as their outstanding citizen for 1953, *Dr. J. M. Sullivan.*

Dr. Martha Helen Hale, Dallas, became a member of the American Academy for Cerebral Palsy at the group's meeting in Fort Worth in November.

Dr. Michael E. DeBakey, Houston, was one of fourteen men throughout the nation named by former President Herbert Hoover to serve on the Hoover Commission's task force on medical services in the federal government, according to an announcement made in November.

Dr. Roger Hanna of Jackson, Mich., became director of tuberculosis hospitals operated by the state of Texas February 1, according to an announcement in the January issue of *Here and There,* official publication of the Texas Tuberculosis Association. Dr. Hanna was superintendent and medical director of the Jackson County Tuberculosis Sanatorium.

Dr. Michael E. DeBakey, professor of surgery at Baylor University College of Medicine, Houston, and *Dr. J. W. Duckett,* professor of clinical surgery, Southwestern Medical School of the University of Texas, Dallas, were two of the three guest speakers for a postgraduate course in surgery offered by the University of Oklahoma School of Medicine, Oklahoma City, early in January.

Dr. Paul Bontley and his family celebrated his parents' fiftieth wedding anniversary with them in Coshocton, Ohio, recently. Dr. Bontley is from Arlington.

Dr. Henry A. Hawkins, New Boston, was elected president of the East Texas Unit of the National Chinchilla Breeders of America at the group's meeting in November in Tyler.

Dr. Thomas J. B. Shanley was honored with a Thanksgiving dinner and presented with a gift by the Plainview Hospital staff before he returned to private practice in El Paso from his position as house physician at the Plainview Hospital and Civic Foundation, Plainview.

Dr. George E. Penny, Laredo, married Mrs. Dorothy L. Morrison in San Antonio, November 1, reports the *South Texas Citizen* of Laredo.

Dr. S. H. Kirkham and Miss Ruby Lea Long, both of Cleveland, were married October 31, according to the Cleveland *Advocate.*

Dallas Southern Clinical Society

Announcement has been made of the honor guests of the Dallas Southern Clinical Society who will participate in the 1954 spring clinical conference March 15-18 in Dallas. The physicians and their specialties are Drs. Willard M. Allen, St. Louis, gynecology; William B. Bean, Iowa City, internal medicine; Edward G. Billings, Denver, psychiatry; William L. Bradford, Rochester, N. Y., pediatrics; Alson E. Braley, Iowa City, ophthalmology; Ormond S. Culp, Rochester, Minn., urology; Clarence Dennis, Brooklyn, surgery; Thomas J. Dry, Rochester, Minn., cardiology; Charles H. Eyermann, St. Louis, allergy; Hugh F. Hare, Los Angeles, radiology; A. C. Hilding, Duluth, otolaryngology; Samuel F. Marshall, Boston, surgery; Paul E. McMaster, Beverly Hills, Calif., orthopedics; George T. Pack, New York, surgery; John Parks, Washington, D. C., obstetrics; Douglas H. Sprunt, Memphis, pathology; C. Dwight Townes, Louisville, ophthalmology; and Walter P. Work, San Francisco, otolaryngology.

This twenty-third annual conference will consist of general assemblies, round-table luncheons, a clinicopathologic conference, lectures, motion pictures, panel discussions, technical and scientific exhibits, and a dinner dance. Registration fee is $25, which may be mailed in advance to the society, Medical Arts Building, Dallas 1. Any member in good standing of a county medical society may attend. Hotel reservations are to be made directly with the hotel of choice.

Study of Man Continues at Dallas Health Museum

In the early eighteenth century Alexander Pope opined that "The proper study of mankind is man." Now in the middle of the twentieth century a good many people still agree with him. Some 200,000 Texans (and a liberal sprinkling of "foreigners") annually agree to the extent that they visit the Dallas Health Museum. Seven days a week, year after year, they file through the halls of this building on the State Fair grounds, studying exhibits on man, the structure of his body, and how to care for it.

Modeling the ribs for a new transparent man is a technician in the Dallas Health Museum workshop (*upper left*). All methods and equipment used in the man's creation were worked out at the shop since they were not obtainable elsewhere. Master minds in his creation were Mrs. Marguerite Hays, museum director, and Vic Klein, architectural designer.

The completed transparent man (*upper right*) replaces the German-made thirty year old man which was featured at the museum for a number of years.

Nurses study one unit of the beginning of life series (*below*). The museum is used regularly by professional groups as well as classes from all grades of public and private schools, and many youth groups such as YMCA, YWCA, Boy Scouts, and Camp Fire Girls.

No. 1 exhibit at the museum is a new transparent man which was recently finished in the museum workshop. This 6-foot replica of the human male has "flesh" of clear plastic through which are revealed brilliantly lighted organs, nervous system, and blood vessels. The "man" revolves slowly while a recorded voice describes the functioning of the body. In making the "man" a total of 10,760 man-hours were consumed. Thirteen different skills were employed. He is insured for $25,000.

Museum personnel believes that the new "man" is superior in many ways to the German-made "Homer," the original transparent man who was on display at the museum for a number of years. Homer has taken up his permanent residence at the American Museum of Natural History in New York City.

Among the newest exhibits at the museum is a long panel presenting a number of phases of good nutrition. Another display called "Common Contagious Diseases" has models of children's faces showing the symptoms of measles, scarlet fever, diphtheria, smallpox, mumps, chickenpox, ringworm of the scalp, and impetigo. Still another of the newest displays is on poliomyelitis.

An entire room at the museum is devoted to a series of handsome exhibits on cancer. The seven warning signals are graphically described. The accepted methods of treating cancer are explained. Visitors are urged to see their physicians when any suspicious irregularity occurs.

Another room is devoted to dental science. A giant illuminated tooth tells at a glance the basic tooth structure. A panel on dental facts and fallacies explodes old wives' tales about the teeth and gives the observer brief, concise answers to many questions relating to his own dental health. A photographic panel shows vividly how cases of malformation can be corrected by orthodontics.

The most popular exhibit in the museum, reports Mrs. Marguerite Hays, director, has always been the birth series. Known as the "Actual Birth of the Baby," it consists of nine statues showing the birth process. It is one unit in a series of exhibits on the beginning of life.

Most valuable of the museum services, according to a number of parents of young children in and around Dallas, are the parentcraft courses which are carried on the year round. Expectant mothers are taught in daytime classes and the fathers at night. Local physicians and a public health nurse give the students information on how to prepare for and care for the baby, and how to enjoy him in the process. They are referred to the classes by their private physicians.

A program on nutrition is just getting under way, sponsored jointly by the museum and the Dallas City Health Department. The first series of weekly classes planned will be on the subject of obesity. They will be open to the public.

Still another museum project which is as yet in the planning stage is a healthmobile. The idea is to equip a mobile unit with replicas of certain of the museum exhibits (even the transparent man). The unit would then travel over the state, stopping on town squares and school yards to open its doors to all comers for a quick lesson in health. This project awaits the necessary funds to be initiated.

Supported by private contributions, the seven year old museum is governed by a twenty-five man board of trustees. Turner B. Baxter, vice-president of the Rio Grande National Life Insurance Co., is president this year. Dr. J. Frank Roark is vice-president; Dr. M. O. Rouse, secretary; and R. L. Thomas, treasurer.

Postgraduate Course at Temple

Dates for the medical and surgical conference to be held at Scott and White Hospitals, Temple, under the auspices of the University of Texas Postgraduate School of Medicine have been changed from March 1-3 to February 22-24. The three-day conference will consist of operative clinics and panels on medicine and surgery. Tuition fee is $25.

Cancer Society Reports Progress

A review of progress in cancer research was presented by five physicians speaking at the annual meeting of the Texas Division of the American Cancer Society in Austin, January 14-16. Drs. Michael B. Shimkin, San Francisco, chief of the Laboratory of Experimental Oncology of the United States Public Health Service; Dr. Charles L. Martin, Dallas, clinical professor of radiology at Southwestern Medical School; Dr. William F. Mengert, Dallas, head of the Department of Obstetrics and Gynecology at Southwestern; Dr. Jack B. Trunnell, Houston, endocrinologist at the M. D. Anderson Hospital for Cancer Research; and Dr. Alfred M. Popma, Boise, Idaho, president of the American Cancer Society, reviewed the progress and prospects in laymen's terms.

A medical session on lesions of the breast featured discussions by Drs. A. C. Broders, Scott and White Clinic, Temple; Clifton D. Howe, M. D. Anderson Hospital, Houston; R. J. White, Fort Worth; Shimkin; and Popma.

John T. Andrews, Lawrence, Kan., general sales manager of the Kansas Public Service Company and chairman of the Kansas Division Cancer Crusade, was the chief speaker for the Crusade session, and Mrs. Harold V. Milligan, New York, director of volunteer recruitment and training for the American Cancer Society, made the principal address at the final luncheon. Dr. Popma was the main speaker at the annual dinner.

Travis T. Wallace, Dallas, was reelected president for the forthcoming year, as were Frank C. Smith, Houston, chairman of the board of directors; Dr. G. V. Brindley, Temple, vice-president for medical activities; Mrs. Joseph M. Perkins, Eastland, vice-president for lay activities; Philip R. Overton, Austin, secretary; and J. Louis Neff, Austin, executive director. Raymond Gee, Fort Worth, was named treasurer. Drs. C. E. Adams, Abilene; Charles T. Ashworth, Fort Worth; Porter Brown, Fort Worth; R. Lee Clark, Houston; Paul North, McKinney; Charles Phillips, Temple; David A. Todd, San Antonio; George Turner, El Paso; and John Dale Weaver, Austin, are among those serving on the executive committee.

The annual report of the executive director pointed out that during the fall and winter of 1953-1954, the cancer society conducted 13 district meetings, largely of a training nature, attended by 363 lay people, with associated scientific sessions drawing 871 physicians. Audiences totaling 277,073 saw motion picture films sponsored by the society; more than 4,000,000 pieces of literature were distributed; and 35,671 women produced 11,560 dozen cancer dressings.

Texas Proctologic Society

The Texas Proctologic Society is holding its third meeting February 27 in Houston, an organizational meeting having taken place in Dallas on September 13, 1952.

Founder members of the organization include Drs. Alvin Baldwin, Jr., Dallas; Hugh Beaton, Fort Worth; Harry B. Burr, Houston; Otho P. Griffin, Fort Worth; C. P. Hardwicke, Austin; J. Wade Harris, Houston; Herbert T. Hayes, Houston; Jack G. Kerr, Dallas; John McGivney, Galveston; Curtice Rosser, Dallas; Robert J. Rowe, Dallas; Tom E. Smith, Dallas; and Victor C. Tucker, San Antonio. Dr. Rosser served as the first president; Dr. McGivney as the first secretary-treasurer. At the 1953 meeting November 7 in Dallas, Dr. Hayes assumed the presidency and Dr. McGivney continued as secretary-treasurer.

The objectives of the society are to facilitate and disseminate knowledge relating to the colon, rectum, and anus; to encourage proctologic research; and to advance the specialty of proctology in Texas. To become a member, a physician must be a graduate of a class A medical school and a member in good standing of his county medical society, must have limited his practice in Texas to proctology for at least three years; must have attended at least one meeting of the society as a guest; and must be invited by the society to join.

Eisenhower's Health Message

On January 18, President Dwight D. Eisenhower sent a special message on his proposed health program to Congress. Briefly, his proposals included (1) "a limited federal reinsurance service to encourage broader health protection to more families," (2) "greater assistance to the states for rehabilitative services," (3) "assistance in the construction of (a) non-profit hospitals for care of chronically ill, (b) non-profit medically supervised nursing and convalescent homes, (c) non-profit rehabilitation facilities for the disabled, (d) non-profit diagnostic or treatment centers for ambulatory patients," and (4) a simplified formula for grant-in-aid "permitting the states to use greater initiative in state programs and take more responsibility" with states being "aided in inverse proportion to their financial capacity."

Four days before, the President had called for changes in the social security laws to provide (a) mandatory coverage of physicians and most other self-employed persons, (b) waiver of old age and survivors' insurance premiums for the disabled, and (c) greater emphasis on the rehabilitation of the physically handicapped, with a close liaison between waiver of premium benefits and the beneficiary's vocational rehabilitation.

Bills to implement most of these proposals have been introduced in Congress. An administration bill providing for reinsurance of health plans was not forthcoming immediately, but a bill previously introduced by Representative Charles Wolverton of New Jersey incorporates the general ideas proposed by President Eisenhower and currently is under consideration in a series of hearings on voluntary health insurance being held by the House Interstate and Foreign Commerce Committee of which Representative Wolverton is chairman. The Wolverton plan calls for a federal health insurance corporation which would underwrite various types of hospital, surgical, and medical insurance programs, permitting individual programs to offer "complete" coverage at low cost with the national corporation paying possibly two-thirds of each subscriber's claim in excess of, say, $500 or $1,000 in any one year. Member plans would contribute a percentage of their gross receipts to keep the national corporation going.

The American Medical Association, officials of which have kept in close touch with developments in Washington, through its Board of Trustees, which held a special meeting January 24 to consider the implications of the Eisenhower health proposals, issued a statement which read in part:

"The Board of Trustees . . . is pleased to find in this message so many of the ideas and principles for which the American Medical Association has striven for so many years.

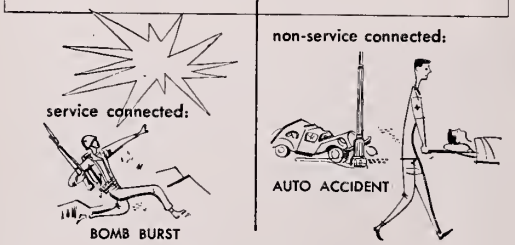
"The Board endorses the general objectives of the President to extend needed facilities, to promote further research, to increase coverage under voluntary health insurance and to rehabilitate the disabled. . . .

"The Administration's federal reinsurance proposal is indefinite. It is not clear whether this is true reinsurance or another form of government subsidy. This whole subject needs careful study and until the plan is spelled out in detail the American Medical Association can make no further comment. . . ."

IN VIEWING THE VA MEDICAL PROGRAM . . .

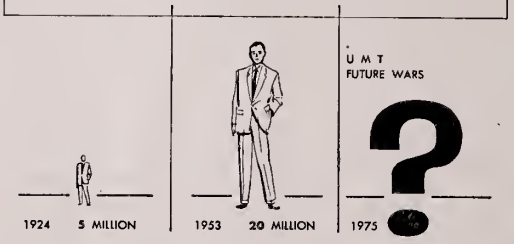
An explanation by the American Medical Association of medicine's attitude toward veteran's care

types of disability



The medical profession fully endorses and supports the medical program of the Veterans Administration through which veterans receive medical care and hospitalization without cost for illnesses or injuries incurred as a result of military service (left). It is felt, however, that the federal government should not assume the responsibility for the medical care of veterans whose disabilities are incurred in civilian life and which hove no relationship to their military service.

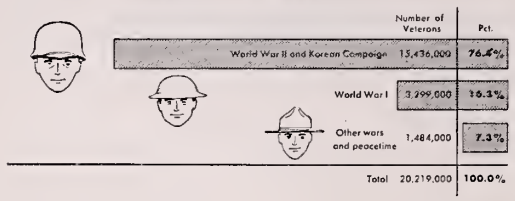
veteran population



The U. S. veteran population now includes about 40% of all adult males. Under existing legislation, the federal government is obliged to provide "free" medical care for many of these veterans, if they request it. The medical profession questions the soundness of providing medical care at federal expense to veterans with non-service-connected disobilities. It is likely that by 1975 the U. S. will truly be o "nation of veterans." If the VA medical program continues to accept responsibility for the care of veterans with service-connected and non-service-connected disabilities alike it is difficult to see how a complete federal health program can be avoided.

analysis of veteran population

PERIOD OF SERVICE



Taxpayers should note that as veterans grow older they require more frequent and increasingly langer periods of hospitalizatian. World War I patients are now hospitalized twice as lang, on the average, as World War II patients with similar disabilities. World War II veterans, relatively young and comprising 76% of the total veteran populatian, present a costly long term responsibility to U. S. taxpayers. The medical profession recammends medical care through the VA for only those veterans with service-incurred disabilities and temporarily for those with tuberculosis or neuropsychiatric conditions of nan-service-connected origin.

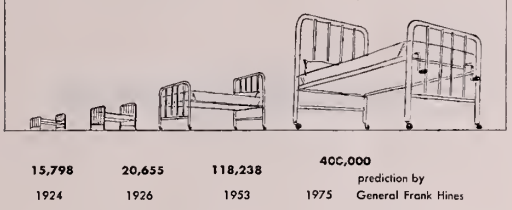
analysis of present veteran population

AGE DISTRIBUTION (Exclusive of those discharged on or after June 27, 1950)

DATE	JAN. 1, 1952	JAN. 1, 1960	JAN. 1, 1970
TOTAL	18,850,000	18,160,000	16,146,000
AGE 22-44	77.2%	62.7%	13.5%
45-64	21.8%	27.4%	73.7%
OVER 65	1.0%	9.9%	12.8%

Older veterans are hospitalized more frequently for civilian-incurred ailments than for service-connected disabilities. By 1970, over 86% of the present veterans will be age 45 or over, more than three times the number in this older age group today. Because of advanced age, they will require more frequent and prolonged hospitalization for illnesses having no relationship to their military service. Responsibility for such medical care should be assumed by the individual or locol government, not by the federal government.

VA hospital beds



15,798	20,655	118,238	400,000 prediction by General Frank Hines
1924	1926	1953	1975

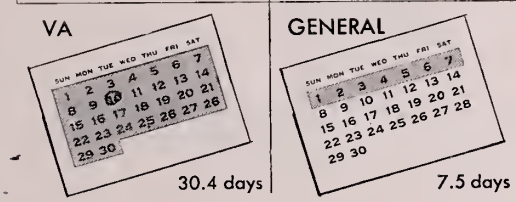
Former VA Administrator Frank Hines estimated that by 1975 under existing VA medical legislation, approximately 400,000 hospital beds will be needed. Yet medical authorities are convinced the VA cannot attract sufficient medical personnel to staff more than 120,000 beds. The VA now maintains three times the number of beds needed for treatment of service-connected cases.

average length of stay in VA hospital

	Average (days)	World War II (days)	World War I & Other (days)
TB	205.8	203.6	210.2
NP	178.3	89.2	430.6
GMS	30.8	23.5	42.5

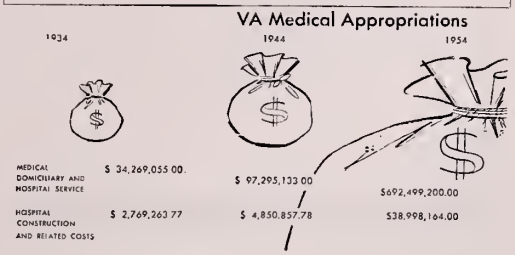
The average length of stay in VA hospitals for World War I veterans is considerably greater than for World War II veterans, which now comprise 76% of the total veteran population. The greatest pressure is yet to be exerted on VA hospitals as World War II veterans grow older and require increased medical care for disabilities unrelated to military service.

comparison of length of stay in VA and general hospitals GM&S



Generol medicol ond surgicol potients in VA hospitols ore confined four times longer thon in non-federol hospitols. VA hospitals odmit potients for exomination, diognosis, ond treotment, much of which is normolly undertoken outside civilion hospitals. Also, VA patients often remoin hospitalized throughout the entire medicol treotment period, whereas non-VA patients ore usuolly treoted ot home during their convolescence. This is o mojor foctor in the tremendous cost of the VA medicol program.

increasing tax burden



In twenty years, the cost of the VA medical program to U. S. taxpayers has increased 1,875%. Yet only 15% of the patients treated in VA hospitals are veterans with disabilities incurred while in uniform. The VA medical program is now second in size and expense only to the nation-wide system of socialized medicine in Great Britain.

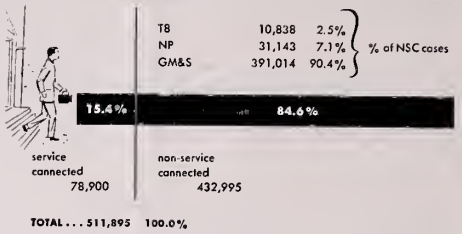
how VA facilities are being used

Patients Discharged During 1951

	TOTAL	SERVICE CONNECTED		NON SERVICE CONNECTED	
TB	21,388	10,550 = 2.1%		10,838 = 2.1%	
NP	47,673	16,530 = 3.2%		31,143 = 6.1%	
GM&S	442,834	51,820 = 10.1%		391,014 = 76.4%	
TOTAL	511,895	78,900	15.4%	432,995	84.6%

The medical profession recommends that VA medical care be maintained for treatment of all service-connected cases and temporarily for all wartime veterans suffering from tuberculosis or neuropsychiatric disorders of non-service-connected origin, within limits of existing VA facilities, if they cannot afford private medical care. General medical and surgical patients with non-service-connected disabilities (now 76.4% of all VA patients) should not be entitled to "free" federal medical care.

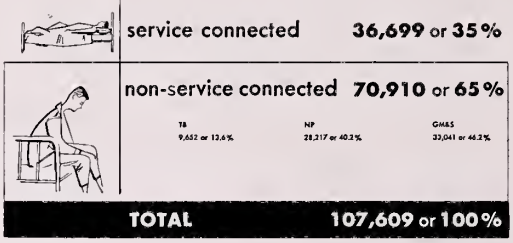
VA patients discharged during 1951



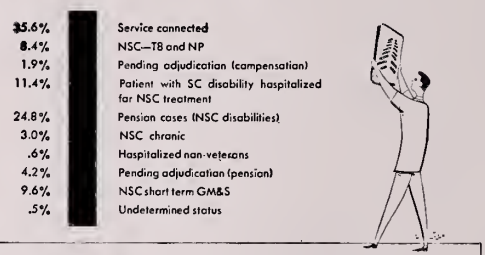
Of 511,895 patients discharged from VA hospitals in 1951, only 15.4% were treated for illnesses or injuries incurred as a result of military service. Physicians believe it is unsound to continue authorization of "free" lifetime medical care for those who suffer no mishap while in uniform, while other citizens with no military background must pay their own way.

VA patient load as of a given day

January 31, 1952



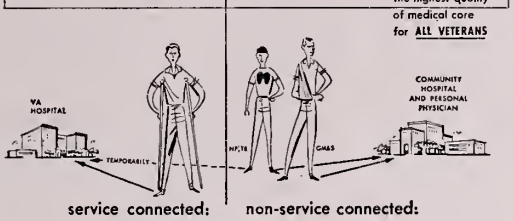
While the VA lists its patient load an a given day as 35% service-connected, anly the lang-range view of admissions and discharges over a year's time gives a truly accurate picture of the service-connected load (only 15.4%). This "discrepancy" appears because the VA's listing of 35% on a daily basis is not affected by the yearly turn-aver af patients—the ratia af VA patients remaining ta those treated and discharged (1 to 5.1). Over a period of a year, 84.6% of VA patients are treated for disabilities incurred after—and having no relationship to—military service.



VA explanation of patient load on a given day

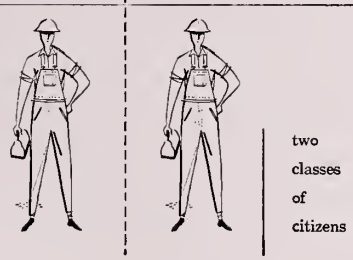
The above classification is presented by the VA as an explanation of the large non-service-connected patient load in its hospitals. The medical profession recommends that only the first categary and thase in the third whose disabilities are determined to be service-connected should be entitled to federal medical care. Non-service-connected TB and NP cases should continue to be treated on a temporary basis until community and state facilities can be readied. The remaining groups obviously have no service-connection and are hospitalized for illnesses or injuries incurred in civilian life.

the medical profession's policy on medical care for veterans



The medical profession stands for the highest quality medical care for all citizens. Veterans, as citizens, should accept the responsibility for their own health needs—unless they became disabled as a result of military service; then it is the responsibility of the Veterans Administration to provide medical care and hospitalization. Because many communities do not as yet have adequate facilities to care for war veterans with non-service-connected tuberculosis or neuropsychiatric disorders, the medical profession recommends that the VA continue—on a temporary basis—to treat these patients.

effects of present veterans medical legislation



It is the belief of the medical profession that it is unsound to authorize free lifetime medical care for veterans who suffered no mishap in uniform, while other citizens with no military background must pay their own way. Althaugh the two men above are identical, they represent "two classes af citizens"—the veteran with na service-connected disability who is granted medical care at federal expense, and the non-veteran wha must personally assume respansibility for his medical care.

what we are talking about...

1. Lack af maral ar legal justificatian in praviding federal medical care far ALL veterans
2. Effect af the VA program on civilian medical training pragrams
3. Current and eventual effects af VA program on civilian health standards
4. Competitian far health persannel and patients
5. Unsaund ecanamics af averlapping federal medical services
6. Expanding tax-burden
7. Veterans' attitude taward VA medical pragram

These seven points are the canclusians af a careful analysis by the medical profession of the current VA medical program. (1) Veterans with no service-incurred disability should assume responsibility for their own medical care on the same basis as other citizens. (2) Medical schaals and hospitals are hard pressed to train enough medical personnel far the benefit of all as long as the federal government siphons off such personnel from civilian programs. This VA practice has caused a duplication of hospital facilities and an unwarranted dispersion of health personnel. (3) The VA is creating an "artificial" shortage of medical personnel at the expense of civilian health programs. (4) Government has placed itself in.competition with civilian medical programs, both for personnel and patients, making it increasingly difficult ta operate civilian hospitals efficiently and economically. (5) Although the federal government is spending millions of dollars under the Hill-Burton act in civilian hospital construction, these haspitals are hard pressed to aperate at reasanable cost while in direct competition with hospitals **wholly** supported by the federal government. (6) The medical profession asks whether a program providing "free" medical care to veterans with na service-incurred disabilities is a justified burden ta impase on the taxpayers af this country. (7) Physicians do not believe that a veteran who served his country wishes to be the recipient of a federal "handout" at the expense of his fellow citizen-taxpayers.

POSTGRADUATE COURSES AT SOUTHWESTERN

A seminar course in bacteriology and chemistry for medical technologists will be given in Dallas February 26 and 27 by Southwestern Medical School of the University of Texas in association with the Postgraduate School of Medicine of the University of Texas.

The bacteriology seminar on February 26 will include such topics as acid-fast bacteria, antibiotic sensitivity tests, virology, leptospiral and rickettsial infections, mycotic diseases, and proper techniques in blood culture. The chemistry seminar on February 27 will include talks on hepatic and renal function tests, newer techniques and standard procedures, preparation of standard solutions and care of scientific instruments, and cholesterol determination and its significance.

Registration fee is $5 and tuition $10 for the bacteriology and chemistry course. Application and check covering the fees should be sent to the office of the dean of Southwestern, 2211 Oak Lawn, Dallas 19.

A postgraduate course in orthopedic surgery was given in Dallas February 15-16 by Southwestern in association with the Dallas Southern Clinical Society and under the auspices of the Postgraduate School of Medicine of the University of Texas, the Texas Medical Association, and the Texas Academy of General Practice.

The program included discussions on such subjects as congenital anomalies of bone, low back problems, knee troubles, common foot problems, basic principles of fracture healing, sprains and dislocations, curvatures and fractures of the spine, fractures of the upper extremity, fractures of the foot and hand, neck-arm syndrome, neuromuscular disorders, infections in bone, bone tumors, fractures of pelvis and hips, and fractures of the knee and tibia. The faculty consisted of full-time and clinical staff members of the medical school.

UNIVERSITY OF TEXAS MEDICAL BRANCH

The new 1,000-bed, thirteen-story John Sealy Hospital, Galveston, became home to more than 300 patients January 20, and tuberculous patients were moved into the new four-story, sixty-bed Ziegler Memorial Hospital shortly afterwards. Patients scheduled to undergo surgery remained in the old hospital until the ten operating rooms in the new building were completely equipped. More than 200 special guests were invited to the exercises.

The American Board of Surgery for the first time has held its oral examination at the Medical Branch. Approximately fifty candidates from the southern and western sections of the United States were in Galveston for the examinations January 15-16.

Dr. Arild E. Hansen, chairman of the Department of Pediatrics at the University of Texas Medical Branch, Galveston, discussed the national duty in regard to the handicapped child and the preventive program for such children at the regional conference of the International Council for Exceptional Children held in Houston the latter part of December. He delivered a paper on vitamin B_6 at the Nutritional Symposium of the American Medical Association in Chicago in November; and in late November and early December he spoke on rheumatic fever at the meeting of the American Academy of General Practice in Colorado Springs and of the American Medical Association in St. Louis.

C. M. Pomerat, Ph. D., professor of cytology and director of the Tissue Culture Laboratory at the Medical Branch, addressed the New York Academy of Science January 15 in New York.

Dr. W. R. Cooke, professor of obstetrics and gynecology at the Medical Branch, was honored recently by the unveiling of an oil portrait of him which is to be placed in the new John Sealy Hospital building.

Molly R. Harrower, Ph. D., clinical psychologist of New York, will conduct special seminars and demonstrate the ways a clinical psychologist may cooperate in current medical problems. For several weeks in February and March of each year, Dr. Harrower will reside in Galveston and lecture at the Medical Branch.

Dr. W. W. Nowinski, director of the Tissue Metabolism Laboratory at the Medical Branch, was visiting lecturer at the Institute of Cardiology, Mexico City, in November and December.

Dr. Robert N. Cooley has recently become professor of radiology and chairman of the Department of Radiology at the Medical Branch. He was previously associated with the Johns Hopkins School of Medicine, Baltimore.

Dr. Hamilton Ford, professor of neuropsychiatry, was elected secretary-treasurer of the Central Neuropsychiatric Association at its October meeting in Indianapolis.

Research grants were given recently to members of the Department of Pediatrics of the Medical Branch by the National Drug Company, $3,000; Sharp and Dohme, Inc., $6,500; United States Public Health Service, $40,896; Bureau of Home Economics and Human Nutrition of the United States Department of Agriculture, $45,000; National Live Stock and Meat Board, $2,000; and Hoffman-LaRoche, Inc., $2,000.

January visitors at the Medical Branch include Dr. M. B. Shimkin, chief of the Laboratory of Experimental Oncology; Hilton Smith, Ph. D., Texas Agricultural and Mechanical College, College Station; and Dr. Leland S. McKittrick, clinical professor of surgery, Harvard Medical School, Boston.

STATE TUMOR CONFERENCE MARCH 31

The State Tumor Conference will be held in Wichita Falls March 31 rather than March 13 as reported in the January JOURNAL. The program, sponsored by the Wichita County Medical Society Tumor Clinic, the American Cancer Society, and the State Department of Health, is approved for credit in formal postgraduate training. There is no registration fee. Scientific discussions will be given by Drs. Shields Warren, Boston; Alton Ochsner, New Orleans; and Jesshill Love, Louisville. Director of the clinic is Dr. Bailey R. Collins.

CORRECTION: WERNER'S SYNDROME

An error appears in the abstract of discussion by Dr. Mavis P. Kelsey, Houston, of the article entitled "Werner's Syndrome; A Study of Adrenocortical and Hepatic Steroidal Metabolism" by Drs. Jere M. Bauer and Jerome W. Conn, Ann Arbor, Mich., which was published in the December, 1953, issue of the TEXAS STATE JOURNAL OF MEDICINE (*49*:882-888). The first sentence of the paragraph beginning at the end of the first column on page 888 should read as follows: "It may be important that several relationships exist between the liver and adrenals, even though superficial evaluation shows no apparent clues to Dr. Bauer's theory."

District Surgical Meeting Held

The Second District of Texas Chapter of the American College of Surgeons held its first annual session November 7 in San Antonio with Dr. Asher R. McComb, San Antonio, president, presiding. Dr. George W. Waldron, Houston, district governor of the college, also was present and participated in the scientific program, which included ward rounds and operative clinics, a panel discussion on the abdomen, and a series of papers by San Antonio surgeons.

LIBRARY SECTION

RECENT PUBLICATIONS BY TEXAS PHYSICIANS

Following is a list of recent articles published by Texas physicians and available at the Memorial Library of the Texas Medical Association. Articles appearing in the TEXAS STATE JOURNAL OF MEDICINE are not included. If a physician who has had a paper printed in the past six months is not named below, the Library would appreciate being notified. Also, the Library would like to have two reprints of each article.

Alexander, S. A., and Downs, J. T., III: Influence of Weight Gain on Pregnancy, Am. J. Obst. & Gynec. *66:*1161-1167 (Dec.) 1953.

Bloxsom, Allan: Infants Delivered by Cesarean Section, Am. J. Obst. & Gynec. *66:*1172-1177 (Dec.) 1953.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library of the following recent gifts:

Dr. C. H. Brownlee, Austin, 445 journals.
Dr. George E. Clark, Jr., Austin, 4 books, 818 journals.
Dr. Josephine Dunlop, Austin, 12 journals.
Dr. James G. Hamer, Austin, 224 journals.
Dr. Henry L. Hilgartner, Austin, 33 journals.
Dr. J. Warren Jackson, Austin, 23 journals.
Dr. J. Edward Johnson, Austin, 7 books, 22 journals.
Dr. S. N. Key, Jr., Austin, 12 journals.
Dr. N. L. Schiller, Austin, 9 journals.
Dr. Milton Turner, Austin, 5 books, 13 journals.
Dr. R. T. Wilson, Austin, 118 journals.

MOTION PICTURES FOR LOAN

They Also Serve

16 mm., sound, 17 minutes.

This film was designed as an introduction to the organization of medical and health services for disaster and to stimulate study of the role the civilian medical profession must assume in peacetime, to insure the systematic and successful response by medical and other health services in disaster situations, particularly in war. It is an excellent film for all medical groups and hospitals.

Observations of Hepatitis

16 mm., sound, 30 minutes. (Courtesy of Mead Johnson & Company, Evansville, Ind.)

This is a lecture film, with numerous charts used in illustration. The film is largely concerned with an outbreak of infectious hepatitis in a children's camp. Careful studies on the epidemiology of the illness were conducted, and the causative agent was isolated and studied. Source of contamination was determined. This film is suitable for showing to pediatricians, internists, and medical students, as well as general practitioners.

Surgial Treatment for Congenital Pyloric Stenosis

16 mm., silent, color, 15 minutes.

The patient is a 3 week old boy. Preoperative roentgenograms are shown, and the anesthesia is discussed. The procedure consists of removal of a wedge-shaped segment of thickened pyloric musculature down to, but not through, the mucosa. A test for patency of the pylorus is shown. Postoperative views are included.

BOOK NOTICES

[1]Clinical Obstetrics

By Members of the Staff of the Pennsylvania Hospital. Edited by CLIFFORD B. LULL, M. D., *Late Director, Division of Obstetrics and Gynecology, Pennsylvania Hospital, and* ROBERT A. KIMBROUGH, M. D., *Director of the Division of Obstetrics and Gynecology, Pennsylvania Hospital; Professor of Gynecology and Obstetrics, Graduate School of Medicine, University of Pennsylvania. 732 pages. $10. Philadelphia, J. B. Lippincott Company, 1953.*

This book is an unusually good clinical survey of obstetrics. It includes the composite work of numerous coauthors, each of whom contributes a fundamental chapter in its make-up. This gives a nice résumé with the increased value of many opinions pertaining to the same subject.

The chapter on nutrition and nutritional deficiencies with their clinical relation to many of the subjective and objective entities encountered in everyday practice is especially informative and interesting. This approach to the problems of prematurity, toxemias, and many of the distressing if not dangerous symptoms experienced by the obstetric patient will be of value to those interested in good prenatal care. The inclusion of an excellent chapter on fertility and the problems relating to childless couples is properly included in a book of this type. Dr. Hingson has added a chapter on analgesia and anesthesia, which is becoming of increasing interest and importance to physicians doing obstetrics.

Because of the especially good and profuse illustrations and the clinical approach, this book will make a good reference for the student and practitioner.

[2]Chronic Pulmonary Emphysema: Physiopathology and Treatment

MAURICE S. SEGAL, M. D., *Clinical Professor of Medicine, Tufts College Medical School; Director, Department of Inhalational Therapy, Boston City Hospital, and* M. J. DULFANO, M. D., *Resident, Department of Inhalational Therapy, Boston City Hospital; Research Fellow in Medicine, Tufts College Medical School. Modern Medical Monographs. 180 pages. $5.50. New York City, Grune & Stratton, Inc., 1953.*

The monograph prepared by Drs. Segal and Dulfano on chronic pulmonary emphysema is an important addition to medical literature. Chronic pulmonary emphysema is a disabling disease which only recently has been better understood in all of its physiologic and pathologic aspects, chiefly due to recent advances in the fields of pulmonary function tests and respiratory physiology. The treatment of this distressing condition, which at best is only palliative, has been little understood by medical practitioners; as a result patients suffering from this condition have gone from physician to physician and even to medical quacks and to the use of patent medicines in their attempt to find relief.

The monograph opens with the definition of chronic pul-

[1]*Glenn R. Wright, M. D., Cleburne.*
[2]*Robert R. Shaw, M. D., Dallas.*

monary emphysema differentiating it from nonpulmonary emphysema and emphysema of the nonobstructive type. The discussion of the development of this condition is prefaced by an excellent description of the intrathoracic pressure relationships in health. A description of the pathologic course is well illustrated with photographs and microphotographs. The chapter on pulmonary function tests applicable in this condition may prove too technical for the average physician but will delight the student of respiratory physiology. The terminology of pulmonary function tests is carefully defined, and the significance of each test in relation to chronic pulmonary emphysema is pointed out. The chapters of "Clinical Concepts, Pulmonocardiac Complications" and "Therapeutic Management" are easily comprehended by any physician and should give the physician confidence in his ability to treat these patients intelligently. The descriptions of therapeutic measures are complete down to exact details of drugs to be used and dosages employed. The chapter on oxygen therapy is especially valuable since this type of therapy has in the main been badly mismanaged because of the physician's ignorance of the dangers of the administration of 100 per cent oxygen in the hypoxic patient. Detailed descriptions are given of the use of the various types of masks and tents that are commercially available for oxygen therapy. The chapter on mechanical respiration describes the use of the newer intermittent positive pressure mechanisms employing various types of valves. The valve of pneumoperitoneum therapy and breathing exercises are adequately discussed.

This monograph actually has a much wider usefulness than its title would indicate. For the general practitioner, it affords an excellent guide toward proper understanding of the signs, symptoms, and complications of this disease and will help him immeasurably in the management of patients with chronic pulmonary emphysema. For the specialist in the management of cardiorespiratory diseases, the monograph is sufficiently detailed and the conclusions so adequately backed by laboratory proof that it can be used as a reference text and a teaching guide. For the student of respiratory physiology, the chapters on pulmonary function tests and the appendix, in which detailed descriptions of the methodology used are presented, provide an adequate, concise manual that would be valuable in the experimental laboratory.

[3]Short Practice of Surgery

HAMILTON BAILEY, F.R.C.S. *(Eng.)*, F.A.C.S., *Emeritus Surgeon, Royal Northern Hospital, London; Senior Surgeon, St. Vincent's Clinic and the Italian Hospital, and* R. J. MCNEILL LOVE, F.R.C.S. *(Eng.)*, F.A.C.S., *Surgeon, Royal Northern, Mildmay Mission, and Metropolitan Hospitals, London. With pathologic illustrations by* L. C. D. HERMITTE, M. B., Ch. B., *(Edin.). Ninth edition, 1,254 pages. $12.50. Baltimore, Williams and Wilkins Company, 1953.*

This volume of general surgery, now in its ninth edition, is interesting because of its inclusion of material which primarily has been helpful to the authors' practices in the diagnosis and treatment of disease, and for this reason it contains valuable personal touches characteristic of other British texts. The footnotes regarding the contribution of current and historical personalities in surgery are an extremely interesting inclusion.

The outlined material is carefully arranged and ordinarily is widely accepted, an exception being certain views regarding the topical use of the sulfonamides.

Often theory suffers by omission; however, the book enumerates countless office and hospital aids which are not generally found in such completeness. Outstanding are the sections on nerves, the hand, and infectious diseases. Weakest are the chapters on the bile ducts and pancreas.

Although some of the numerous illustrations are of such quality as to be of doubtful assistance, as, for example, several of the black and white photographs, most of them are quite descriptive, particularly the several line drawings.

Despite its semioutline form and its deemphasis on surgical technique, this text deals with the subject of surgery as a whole and should be of great interest to the student and general practitioner because of its comprehensiveness.

[3]*W. R. Whitehouse, M. D., Cleburne.*

[4]Essential Urology

FLETCHER H. COLBY, M. D., *Chief of the Urological Service, Massachusetts General Hospital; Associate Clinical Professor of Genito-Urinary Surgery, Harvard Medical School, Boston. Second edition. 650 pages. $8. Baltimore, Williams and Wilkins Company, 1953.*

A welcome addition to the urologic library is this new book, which, as its title implies, is a presentation of the important facts concerning genitourinary conditions. It does not pretend to be a comprehensive textbook of urology. It gives little attention to the rare conditions. However, it discusses in detail and in a thorough manner the more common problems which are met within this field of medicine.

Particularly worthy are the descriptions of the embryology of the genitourinary organs and the discussion of diseases of the prostate with the various types of surgical management.

The section on the physiology of the kidney is modern and gives a practical understanding of the abnormal functioning of kidneys in disease and following systemic trauma. The chapter on tuberculosis of the genitourinary organs has been revised. This excellent discussion pays particular attention to the modern treatment by surgery and the newer drugs. The chapter on disease of the testes also has been revised, and the discussion on testicular tumors is worth-while reading. This also applies to the subject of urinary calculi. Illustrations throughout the book are abundant and informative.

The author planned this book as a useful aid for students, residents, and general practitioners. However, the experienced urologic surgeon will find it a beneficial addition to his medical library because of the concise and thorough discussion of various urologic problems.

[5]Diagnostic Tests in Neurology

ROBERT WARTENBERG, M. D., *with forewords by* SIR GORDON HOLMES, M. D., F.R.S., *and by* STANLEY TRUMAN, M. D. *200 pages. $4.50. Chicago, Year Book Publishers, 1953.*

This text is an excellent review of diagnostic neurologic tests. Dr. Wartenberg brings out strongly the fact that too much reliance is paid on extensive laboratory work and not enough on careful observation which is available to anyone so inclined. The book has an introduction describing the plan of examination and procedures which are applicable in the office. The book is further divided into seven sections dealing with the tests of cranial nerves, peripheral nerves, pyramidal system, extrapyramidal system, cerebellar system, sensory system, and vasomotor-trophic system.

Dr. Wartenberg, a distinguished neurologist who has studied and taught on two continents, gives the benefit of his many years of observation. The book has many pictures which clearly show the findings in the diagnostic tests which he describes. This adds to its usefulness in further delineating the tests.

The book certainly is to be recommended both to the general practitioner and to the specialist as an excellent text on diagnostic tests in neurology.

[4]*Robert F. Thompson, M. D., El Paso.*
[5]*Robert J. Goodall, M. D., Houston.*

[6]Commotio Cerebri

CYRIL B. COURVILLE, M. D., *Director, Ramon Cajal Laboratory of Neuropathology, Los Angeles County Hospital, Los Angeles. 161 pages. $5.25. Los Angeles, San Lucas Press, 1953.*

Dr. Courville has done an excellent piece of work in compiling and organizing the available medicolegal aspects of cerebral concussion and the postconcussion syndrome. Through the author's involvement in the courtroom aspects of compensation demands following head injuries as well as his experience in the field of neurology and neuropathology, he has set down in one volume a survey which will be a reference source to physicians and attorneys in problems of this type. The author approaches his subject from the historical viewpoint with excellent use of source material. This same approach to the mechanism and the pathology of commotio cerebri and the process of healing permits the reader not only to find valid conclusions within this volume but to expand them by following out the quoted source material. Management of this type of injury is rather well covered although it appears that the author is as often stumped for specific remedies as are many of lesser experience.

This monograph is highly recommended to any physician who becomes involved in the medicolegal aspects of head injuries. I feel that it would be of special value as a preparation for anyone who is called upon to testify in court. This book also will be of use to those of more purely clinical interest as an excellent survey of the entire problem from historic, pathologic, and therapeutic standpoints.

[7]Pain Syndromes and Their Treatment

JAMES M. TARSY, M. D., *Chief, Arthritis Clinic, University (New York Postgraduate) Hospital, New York University-Bellevue Medical Center; Assistant Clinical Professor of Medicine, Postgraduate Medical School, New York University. 592 pages. $12. Springfield, Ill., Charles C Thomas, 1953.*

This book is an exhaustive review of pain syndromes of the upper extremities and trunk. The author gives satisfactory discussions of the pathogenesis, diagnosis, and treatment of these syndromes, and, as he states in his introduction, has compiled much information that has been published previously in articles dealing with individual pain syndromes.

This book would be a worth-while addition to the physician's diagnostic armamentarium.

[8]Basic Bacteriology: Its Biological and Chemical Background

CARL LAMANNA, PH. D., *Associate Professor of Bacteriology, and* M. FRANK MALLETTE, PH. D., *Associate Professor of Biochemistry, Johns Hopkins University School of Hygiene and Public Health. 677 pages. $10. Baltimore, Williams and Wilkins, 1953.*

The material presented in this book is intended for the more advanced student of bacteriology or microbiological biochemistry. The authors have emphasized the theoretic rather than the descriptive aspects of the subject. Several chapters are devoted to the fundamental concepts of physics, chemistry, and biology which are essential for an understanding either of bacteriologic phenomena or of the techniques employed in bacteriology. These chapters include discussions on physical properties of bacteria, theory of microscopy, the physics of light and color, and the chemistry of dyes used in staining. The microbiological biochemist will find the chapters on enzymes, nutrition of bacteria, and bacterial metabolism of especial interest. The use of diagrams rather than tables enables the reader more easily to comprehend the topic under discussion.

The book is a comprehensive and well-written treatise on pure bacteriology; however, it was not designed to present the medical aspect of the subject.

[9]Synovial Fluid Changes in Joint Disease

MARIAN W. ROPES, M. D., *Associate Physician, Massachusetts General Hospital, and Assistant Clinical Professor of Medicine, Harvard Medical School, Boston, and* WALTER BAUER, M. D., *Chief of Medical Services, Massachusetts General Hospital, and Jackson Professor of Clinical Medicine and Director of Robert W. Lovett Memorial Foundation for the Study of Crippling Disease, Harvard Medical School. 149 pages. $4. Cambridge, Mass., Harvard University Press, Commonwealth Fund, 1953.*

There long has been a need for a concise source of information about synovial fluid characteristics which this book answers in a satisfactory manner. Only general descriptions of synovial fluid have been presented heretofore in the texts dealing with arthritides, and this probably has been due to the fact that such studies are extremely difficult. Therefore, the authors of this publication have performed a real service to the profession.

The opportunity to learn more about the synovial fluid is timely since physicians are now doing more aspirations of joints for treatment purposes and can easily secure samples for analysis; the instillation of hydrocortisone, antibiotics, and hyaluronidase in treatment of certain joint diseases as well as during the taking of pneumarthrograms is becoming a much more common procedure.

The accompanying charts are an aid both in diagnosis and prognosis of joint diseases, especially the summarization chart in the back of the book. The distinguishing features between the two large groups of joint diseases are clearly defined along with certain more specific changes indicating, when combined with clinical impressions and roentgen-ray findings, the evidence in favor of individual joint conditions. The changes noted in the chemical and cytologic analyses during treatment offer a valuable adjunct in following a case. In view of the sometimes inconclusive evidence through study of biopsy material, the opportunity to gain information in this manner will be welcomed by most physicians concerned with joint diseases.

It is gratifying, indeed, to find, at last, this much needed description of synovial fluid changes.

[10]The Psychopathic, Delinquent and Criminal

GEORGE N. THOMPSON, M. D., F.A.C.P., *Associate Clinical Professor of Neurology and Psychiatry, School of Medicine, University of Southern California, Los Angeles. 142 pages. $4.50. Springfield, Ill., Charles C Thomas, 1953.*

Organicists will like this treatise.

This book of ten chapters lends support to organic causes of psychopathic delinquencies and psychopathic criminal behaviors.

The author gives evidence for the importance of heredity, trauma, infection, neoplasms, degeneration, and other diverse factors in the causation of these disorders. He plays down the significance of psychogenic factors.

There are discussions of psychopathic personality as an entity and psychopathology of the entity is handled from the author's viewpoint. Cases are presented. Treatment is professed to be a serious and difficult problem.

The book is suggested for specialists and researchers.

---

[6]*Clarence S. Hoekstra, M. D., Dallas.*
[7]*R. Vincent Murray, Jr., M. D., Austin.*
[8]*Robert P. Sandman, M. A., Austin.*
[9]*P. L. Day, M. D., San Antonio.*
[10]*Lee F. Scarborough, M. D., Austin.*

[11]The Roentgen Aspects of the Papilla and Ampulla of Vater

MAXWELL H. POPPEL, M. D., F.A.C.R., *Professor of Radiology, New York University Post-Graduate Medical School, and Director of the Roentgen Ray Department, Bellevue Hospital;* HAROLD G. JACOBSON, M. D., F.A.C.R., *Director, Department of Roentgenology, Hospital for Special Surgery, New York; and* ROBERT W. SMITH, M. D., *Senior Resident in Radiology, Veterans Administration Hospital, Bronx, N. Y. 195 pages. $8.50. Springfield, Ill., Charles C Thomas, 1953.*

The monograph is intended by the author to be a "complete presentation of the roentgenologic survey of the anatomy, physiology, and pathological status of the Vaterian region." Though it may fall short of the goal, it is a worth-while effort.

The development, anatomy, and physiology of the papilla and ampulla of Vater and of the sphincter of Oddi are reviewed with a report, illustrations, and tabulation of the authors' anatomico-roentgen studies of 100 specimens.

Malignancy, both primary in the Vaterian segment and extended from adjacent organs, inflammatory and calcerous disease, benign tumors, and biliary dyskinesia are discussed.

There are 106 good figures and several tables. A large proportion of the book is given to differential diagnosis.

A bibliography listing 138 references and an index follow the text.

In general, this book seems to come up to the standards set by the authors. It should be readily available to anyone interested in the diagnosis of gastrointestinal conditions.

[11]*C. H. Frank, M. D., Texarkana.*

Fool's Haven

C. C. CAWLEY. *210 pages. $2.75. Boston, House of Edinboro, 1953.*

The theme of "Fool's Haven" is woven around a young girl and her mother who have been caught in the web of a religious cult, the basic principles of which were not to seek a doctor but to pray. The belief was so great that one life was lost because of a ruptured appendix and a young lover left his career in science to study law in hopes that he could help break up such cults.

"Fool's Haven" is a story that could take place in any neighborhood when cults defying medicine are allowed to operate.

Stedman's Medical Dictionary

Edited by NORMAN BURKE TAYLOR, M. D., F.R.S.C., F.R.C.S. *(Edin.),* F.R.C.P. *(Can.), M.R.C.S. (Lon.), Associated with University of Western Ontario. Eighteenth edition. 1561 pages. $11.50. Baltimore, Williams and Wilkins, 1953.*

This new edition of a favorite reference tool covering medicine and the allied sciences has added many new entries and illustrations. The main entries have been changed from Latin to English. The section on etymology contains a helpful root-word list. The appendix with its tables and charts is still a valuable part of the dictionary.

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

Rural Health Conference in Dallas

The ninth National Conference on Rural Health is to be held at the Baker Hotel in Dallas, March 4-6. With the theme "Let's Put More 'U' in Comm*Unity*," the conference is sponsored by the American Medical Association's Council on Rural Health, Dr. Carll S. Mundy, Toledo, acting chairman. Speakers and three general discussion panels will stress the importance of organized community efforts in the maintenance of healthful conditions in agricultural areas.

Topics for panel discussions will be what farm areas are doing to solve pressing rural health problems, the role of nutrition in rural health programs, and the various aspects of health insurance. Dr. Everett C. Fox, Dallas, will participate in one of the discussions.

Dr. Edward J. McCormick. Toledo, AMA President, will review the AMA's contributions to rural health. Dr. Joseph I. Greenwell, New Haven, Ky., national General Practitioner of the Year, will discuss the role of the family doctor in small communities. Dr. Chester U. Callan, Rotan, chairman of the Texas Medical Association's Committee on Rural Health, will present a planned approach to doctor distribution. Other speakers will discuss how high school girls formed a club to promote interest in nursing as a career, how a community was able to build and operate a hospital on a budget far below average, how a physician met a community's need for a clinic by building one at his own expense, and how soil is important to nutrition.

Chauncey Leake, Ph. D., Galveston, vice-president of the University of Texas School of Medicine, will be a dinner speaker. Among those who will give greetings will be Mayor Robert L. Thornton, Dallas; Dr. George F. Lull, Chicago, AMA secretary and general manager; Dr. George Turner, El Paso, President of the Texas Medical Association; and Mrs. Leo Schaefer, Salina, Kan., President, Woman's Auxiliary to the AMA.

Presiding over the various sessions will be Dr. Allen T. Stewart, Lubbock; Dr. N. H. Gardner, East Hampton, Conn.; Dr. George F. Bond, Bat Cave, N. C.; Dr. Willard A. Wright, Williston, N. D.; and Dr. Mundy, all of whom are regional directors of the council.

As in the past few years, an informal preconference session will be held on the morning of March 4 for doctors only. This session will be devoted to problems confronting physicians who are members of state rural health committees or committees handling rural health problems. Greetings will be extended by Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association and member of the AMA Board of Trustees, and speakers will include Dr. James Stevenson, Tulsa, treasurer of the Oklahoma Physician's Service; Dr. Henry Randel, Fresno, Calif., chairman of the California Medical Association's Committee on Rural Health; and Dr. Mundy.

TEXAS MEDICAL ASSOCIATION

COUNTY AND STATE OFFICIALS CONFER

The semiannual meeting of the Executive Council of the Texas Medical Association was held in the headquarters building in Austin on January 24 with the President, Dr. George Turner, El Paso, expediting business sufficiently for adjournment before noon. This meeting, at which reports from most councils and committees were submitted, concluded a week-end of activity which included an all-day conference of county medical society presidents and secretaries and numerous committee meetings January 23.

Highlights of the week-end was the afternoon program arranged for county society officers and featuring addresses by Dr. Frank E. Wilson, Washington, D. C., director of the American Medical Association's Washington office; Dr. Everett C. Fox, Dallas, former chairman of the Texas Association's Council on Medical Economics; and Dr. F. J. L. Blasingame, Wharton, member of the AMA Board of Trustees and President-Elect of the Texas organization. These three discussed the medical care policies of the Veterans Administration and the attitude of the medical profession toward them and also the proposals relating to health introduced to Congress earlier in the week by President Dwight D. Eisenhower. The activities of the AMA Washington staff and of the AMA Legislative Committee were described, and the urgency of support by individual physicians, working in their own communities and communicating with their own representatives and senators, was stated.

During the morning, the county officers had an opportunity to become better acquainted with the state organization. Nine councils, boards, and committees were described and their present programs outlined by the respective chairmen: Dr. R. W. Kimbro, Cleburne, Trustees; Dr. R. G. Baker, Fort Worth, Councilors; Dr. Charles L. McGehee, San Antonio, Medical Defense; Dr. G. W. Cleveland, Austin (representing Dr. J. B. Copeland, San Antonio), Medical Jurisprudence; Dr. May Owen, Fort Worth, Scientific Work; Dr. Harvey Renger, Hallettsville, Medical Economics; Dr. M. O. Rouse, Dallas, Medical Education and Hospitals; Dr. Troy A. Shafer, Harlingen, Public Relations; and Dr. Chester U. Callan, Rotan, Rural Health. A question and answer period followed this session as well as the afternoon panel discussion.

Board and council chairmen reported briefly to the Executive Council, calling attention to the satisfactory financial condition of the Association, reporting on studies to determine what action should be taken to approve insurance companies desiring to provide group policies for members of the Association, revealing plans possibly leading toward college courses for doctors' assistants and medical school courses in medical jurisprudence, and outlining the scientific programs being carried on by telephone broadcast and at the annual sessions for the further education of practicing physicians.

The Committee on Library Endowment called attention to the gift of his library to the Memorial Library of the Texas Medical Association by Dr. L. H. Reeves of Fort Worth and commended such action, as well as money gifts to the Library endowment fund, to other members of the Association and their families. The Committee on Public Relations pointed with satisfaction to the Medical Students' Days held partially under its auspices in the three medical schools of the state, the conference for county presidents and secretaries the preceding day, and the twenty-nine special newspaper sections commemorating the hundredth anniversary of organized medicine in Texas which were issued in recent months. The Committee on Doctor Distribution reported not a single request for additional doctors in a pilot survey directed at all communities of more than 800 population in District 7, proof to the committee that physician care in that area is adequate. The Committees on Nursing Care, Blood Banks, Emergency Medical Service, and Rural Health, gave evidence of developing programs in their respective areas in cooperation with other agencies. The Committee on Infringement of the Private Practice of Medicine indicated that the medical school staffs and faculties and the private physicians practicing in the same towns apparently have worked out satisfactorily the problems affecting referral and treatment of patients.

The Executive Council officially designated April 25, 26, and 27 as the dates for the 1955 annual session, scheduled to be held in Fort Worth. It also adopted two resolutions, one recommending to Governor Allan Shivers that the special session of the Legislature which he has called include a consideration of further financial support to the medical and dental branches of the University of Texas and to the state hospitals and special schools and the other approving development of a clearing house for blood by the Texas Association of Blood Banks.

Mrs. E. W. Coyle, San Antonio, President of the Woman's Auxiliary to the Texas Medical Association, addressed the Executive Council by invitation, calling attention to the program which the wives of Texas physicians are carrying on to bolster the aims and objectives of the medical profession. She introduced Mrs. Mark Latimer, Houston, President-Elect of the State Auxiliary, and Mrs. George Turner, El Paso, President-Elect of the AMA Auxiliary.

Doctor Distribution Studied

During the last several years, anyone listing the main public relations problems of the medical profession in Texas would have included the problem of doctor distribution.

There are 254 Texas counties, and although the ratio of doctors to population compares reasonably with the national average (Texas: 1 per 813; United States: 1 per 730), the state's broad reaches and sparsely populated counties lead to misconceptions about "doctor shortages." Many well-meaning friends of medicine in recent years have referred to the "shortage of doctors in Texas."

About a year ago the Texas Medical Association determined to set up a slide rule of facts against which to measure the actual conditions as opposed to supposition and rumor.

The Board of Trustees named a special Committee on Doctor Distribution headed by Dr. Chester U. Callan, Rotan, chairman of the Committee on Rural Health, and consisting also of Dr. Harvey Renger, Hallettsville, chairman of the Council on Medical Economics; Dr. Troy A. Shafer, Harlingen, chairman of the Committee on Public Relations; Dr. J. C. Terrell, Stephenville, past chairman of the Committee on Rural Health; and Dr. Allen T. Stewart, Lubbock, past president of the Texas Medical Association and present member of the American Medical Association's Committee on Rural Health.

Committee objectives were simple: (1) Find out the extent of "doctor shortage" in the eyes of the profession. (2) Find out the extent of "doctor shortage" in the eyes of Texas communities. (3) Where shortages exist, do something about them. This would include showing communities their part of the two-way job.

The committee immediately launched a survey of the profession itself. Questionnaires went to 6,500 doctors. Answers came from 6,000. The committee established to its satisfaction that medicine's viewpoint held that help was needed in the ranks of the general practitioner, particularly in communities under 5,000, and most particularly in the northwest areas of Texas.

Thus armed, the committee faced the problem of asking communities what they think. Realizing that it might be swamped with requests for help—justified or based on misinformation—the committee determined to move slowly. A pattern for statewide survey was applied to the reasonably limited confines of District 7 surrounding Austin.

The same approach which would be used in every county in the state at the proper time was utilized in the ten counties of the district. A printed pamphlet, "Does Your Community Need a Doctor?" was prepared for distribution to

community officials. Dr. J. M. Coleman of Austin, district councilor, wrote letters to each doctor in the district, as well as to county society officers. He explained the intent and the mechanics of the survey about to be launched.

Then Dr. Callan wrote the chamber of commerce secretary, the mayor, or the county judge, as appropriate, in each community with 800 population or more. His letter follows:

"Dear Sir:

"As you doubtless know, many critics of the American Free Enterprise System maintain a running fire of propaganda against the business and professional men to weaken public confidence in our way of life. The medical profession is well acquainted with these tactics.

"One criticism most frequently heard is that there aren't enough doctors to go around. Actual facts show that the ratio of physicians to population in America is much higher than any other nation in the world.

"However, the medical profession of Texas recognizes that problems do exist, primarily in the area of doctor distribution—not of doctor shortage. Our recent statewide survey has established this fact clearly.

"In this respect, we are making a sincere and continuous effort to extend medical service on the broadest possible base. Among many other things being done to place more doctors in rural areas, a special committee on doctor distribution has been created by the Texas Medical Association.

"The function of this committee is to work at the local level with qualified representatives of Texas communities where the facts show that such communities do not have enough doctors of medicine.

"In this connection, we are enclosing a brochure which contains explicit instructions on pages 5, 6, and 8, which, in the event your community needs additional doctors, should be followed carefully, and the results sent to Texas Medical Association, 1801 Lamar Boulevard, Austin. It is our belief, then, that representatives of this committee can meet with representatives of the community and determine definite needs for additional doctors of medicine in your town.

"In the event that we do not hear from you, we shall know that you consider the number of doctors in your community as sufficient.

"Please understand that this is a sincere effort by the more than 6,500 members of the Texas Medical Association to establish the real facts as regards the distribution of medical care and, wherever possible, to do something about existing shortages discovered."

Committee members meeting in Austin in late January reviewed the findings of the survey. They revealed that not one community requested additional help. Conclusions reached by the committee were that either the distribution problem is not nearly so serious as medicine's critics would make it out to be, or the particular district under survey is happily far better off than others throughout the state.

In any event, the wisest course to the committee seemed to be to pursue the pilot survey through portions of three other districts until such time as it may be broached statewide, and materials for this purpose are now ready.

Medical Officer Examination

A new medical officer examination has been announced by the United States Civil Service Commission for filling the positions of rotating intern and resident in training in psychiatry and in neurology at St. Elizabeth's Hospital, Washington, D. C. Further information is available from the commission, Washington 25.

SIDE ATTRACTIONS AT ANNUAL SESSION

Sometimes the sideshow at a circus is as entertaining as the main performance, and the Council on Scientific Work of the Texas Medical Association, cooperating with specialty societies, medical alumni and fraternity groups, and others who have a contribution to make at a physicians' convention, reports a full slate of scientific and social activity to assure a "sideshow" worthy of being on the same bill with the more official program at the Texas Medical Association annual session in May.

At least twelve related specialty organizations will convene Sunday or Monday, May 2 or 3, with scientific presentations open to all members of the Texas Medical Association. The Texas Air-Medics Association, in addition to a round-table discussion of Civil Aeronautics Authority problems participated in by Dr. W. R. Stovall of Washington, D. C., will be taken on a tour of the research laboratories of the School of Aviation Medicine at Randolph Field.

The Texas Chapter of the American College of Chest Physicians promises Dr. William A. Hudson of Detroit, president-elect of the American College of Chest Physicians, to deliver the first annual Hendricks Memorial Address.

The Texas Dermatological Society will offer a series of papers on penicillin, hydrocortisone ointment, vulvar dermatoses, kissing bug bites, swimming pool granuloma, and Letterer-Siwe disease.

Dr. Herbert Pollack, New York, will be guest speaker for the Texas Diabetes Association, speaking on management of diabetic coma and dietary requirements of the diabetic patient. He also will participate in a panel discussion on the newly discovered diabetic.

Cardiography and new treatments, medical and surgical, of heart disorders will be discussed on the Texas Heart Association program, for which Dr. Myron Prinzmetal, Los Angeles, will be special guest.

The Texas Neuropsychiatric Association will present Dr. Tracy J. Putnam, Beverly Hills, Calif., in a paper on the treatment of epilepsy. The title of one of the presentations by Texas psychiatrists is "The Significance of Reciprocal Depressions in Marital Partners."

Eight papers by members of the armed forces and an address by Dr. William T. Green, Boston orthopedist, will be featured on the program of the Texas Orthopedic Association. Dr. Green, orthopedic surgeon-in-chief of the Children's and Peter Bent Brigham Hospitals and clinical professor of orthopedic surgery at Harvard Medical School, will spend several days in Houston touring the Texas Medical Center before going to San Antonio.

A symposium on the management of trauma involving disturbance of cerebral and cardiorespiratory function is scheduled for the Texas Railway and Traumatic Surgical Association meeting.

Dr. Digby Leigh, Vancouver, B. C., Canada, will discuss pediatric anesthesia for the Texas Society of Anesthesiologists.

A survey of 1,000 consecutive gastroscopic examinations and anorectal complications of antibiotics given orally are among the topics to be discussed for the Texas Society of Gastroenterologists and Proctologists.

The Texas Society of Pathologists will discuss basic concepts of response to trauma as well as other problems in pathology.

City and county health officers, in addition to learning more about poliomyelitis, leprosy, and infectious hepatitis, will consider the current problems of air pollution and community disasters. Dr. Gordon W. Grace, Los Angeles, will speak.

A luncheon for life insurance medical directors, a convention of physical therapists, and tentatively an organizational meeting of physicians interested in geriatrics will be held in San Antonio at the time of the Texas Medical Association annual session.

The oldsters among the doctors of Texas have been given a cordial invitation by the Fifty Year Club to attend its breakfast Tuesday morning, May 4. Members of the Texas Medical Association who have been in practice fifty years or more are eligible for membership in this organization, the main purpose of which is to encourage friendship and the sharing of experiences by doctors of medicine who have seen service from horse and buggy days to the present.

The Past Presidents Association has planned its annual luncheon for Monday, May 3.

Eight alumni associations (Texas Medical Branch, Southwestern, Baylor, Tulane, Arkansas, Tennessee, Vanderbilt, and Louisiana State) will hold dinners May 3, and seven medical fraternities are planning parties to precede the entertainment for the President of the Texas Medical Association, Tuesday, May 4. This latter event, although an official part of the annual session program, will be different from most such entertainments, featuring a buffet supper for those who want it and a floor show of Mexican songs and dances in the courtyard of La Villita.

As announced previously, committee meetings will begin Saturday, May 1; the House of Delegates will convene Sunday, May 2; specialty societies will meet Sunday and Monday, May 2 and 3; opening exercises and memorial services of the Texas Medical Association will be held Monday, May 3; and the scientific program of the Association will be held Tuesday and Wednesday, May 4 and 5. The Woman's Auxiliary will meet concurrently. Hotel reservations should be made directly with the hotel of choice in San Antonio.

COUNTY SOCIETIES

Baylor-Knox-Haskell Counties Society

November 10, 1953

The Baylor-Knox-Haskell Counties Medical Society participated in the telephone postgraduate broadcast sponsored by the Texas Medical Association November 10. The group met in the office of Robert L. Newsom, Munday, to hear the discussion on antibiotics.

Brazoria County Society

December 3, 1953

(Reported by Carlos E. Fuste, Jr., Secretary)

Brazoria County Medical Society met December 3 in Freeport for dinner and a business session at which they elected the following officers for 1954: William D. Nicholson, Freeport, president; M. Warren Hardwick, Angleton, vice-president; Carlos E. Fuste, Jr., Alvin, secretary; John S. Caldwell, Jr., Velasco, treasurer; and Joe S. Montgomery, Angleton, retiring president, member of the board of censors.

The society voted to sponsor locally the essay contest of the Association of American Physicians and Surgeons.

January 7, 1954

(Reported by Carlos E. Fuste, Jr., Secretary)

At the January 7 meeting of the Brazoria County Medical Society in Freeport, the following committee chairmen were announced by the president, William D. Nicholson, Freeport: M. Warren Hardwick, Angleton, program; Carlos E. Fuste, Jr., Alvin, medical jurisprudence and public relations; A. O. McCary, Freeport, tuberculosis; John C. O'Leary, Lake Jackson, medical advisory on poliomyelitis; R. M. McCary, Freeport, advisory to state public health and welfare; Ralph E. Gray, Lake Jackson, procurement and assignment; John S. Caldwell, Jr., Velasco, civil defense; and Robert H. Kirkpatrick, Freeport, blood banks.

Cass-Marion Counties Society

November 18, 1953

The Cass-Marion Counties Medical Society met with its woman's auxiliary November 18 at Linden for dinner followed by separate business sessions. Society members heard a discussion of the kidneys by Robert Womack, Shreveport.

Cherokee County Society

November 24, 1953

The annual Thanksgiving dinner meeting of the Cherokee County Medical Society and its woman's auxiliary was held at the Rusk State Hospital on November 24. The dinner and all-patient program were under the direction of the hospital staff. C. L. Jackson, hospital superintendent, acted as toastmaster.

Cooke County Society

November 16, 1953

Recent Problems of Anesthesia—Earl Weir, Dallas.

Following dinner with the local woman's auxiliary, the Cooke County Medical Society convened for a business and scientific session November 16 at Gainesville. Dr. Weir, chief anesthesiologist at Baylor Hospital, discussed the recent problems of anesthesia that have resulted from the development of new drugs.

Dallam-Hartley-Sherman-Moore Counties Society

November 12, 1953

The Dallam-Hartley-Sherman-Moore Counties Medical Society met November 12 in Dalhart. M. E. Jacobson, Amarillo, was guest speaker.

Dallas County Society

December 8, 1953

(Reported by W. W. Fowler, Secretary)

Radical Treatment for Carcinoma of Prostate—Harry M. Spence, Dallas.

Hormonal and Isotope Treatment for Carcinoma of Prostate—Joseph D. Mitchell, Jr., Dallas.

Role of Hyaluronidase in Recurring Renal Calculi—John M. Pace, Dallas.

The Dallas County Medical Society met December 8 in Dallas, elected new officers, and heard Jay Waddell, chairman of the society's medical jurisprudence committee, ask for support of the Bricker Amendment to the United States Constitution.

After the reading of a memorial for those society members who had died during 1953, the following new officers were presented: R. A. Trumbull, president-elect; Harry M. Spence, vice-president; W. W. Fowler, secretary emeritus; Glenn D. Carlson, secretary; Porter K. Mason, treasurer; Earl Loftis, censor; Dale Austin and Haynes Harvill, members of the board of directors; Barton E. Park, Fred W. Horn, Dr. Trumbull, and Edward White, delegates; T. M. Kirksey, L. S. Thompson, Frank H. Kidd, Jr., and Arnott DeLange, alternates; and J. O. S. Holt, Marvin Knight, Robert L. Moore, and Robert J. Rowe, members of the nominating committee.

The scientific program was presented as outlined above.

Dr. Park, chairman of the board of directors, presented a recommendation from the public health committee, which was adopted. The recommendation was that the expense of operating well-child conferences in Dallas be assumed

by the local city and county governments under direction of the city and county health departments, inasmuch as federal funds are no longer available, and that the following regulations apply: (1) Physicians shall be authorized to accept payment from the Health Department for their services at the conference sessions. (2) The conferences shall be limited to 15 patients per physician per session. (3) Only well children under 6 years of age shall be accepted.

Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Society

November 17, 1953

Management of Obstructive Prostate—E. O. Bradfield, Temple.
Surgical Management of Duodenal Ulcer—R. R. White, Temple.

Members of the Eastland-Callahan-Stephens-Shackelford-Throckmorton Counties Medical Society heard the above talks when the society held its regular meeting November 17 in Eastland.

Hale-Floyd-Briscoe-Swisher Counties Society

January 12, 1954

(Reported by John C. Long, Jr., Secretary)

Medical Induction of Labor—Eugene McCarthy, Plainview.
Discussion—Russell K. Williams, Plainview.

The Hale-Floyd-Briscoe-Swisher Counties Medical Society held its first meeting of 1954 on January 12 in Plainview with Roy R. Roberts, Plainview, president, presiding over the business session which preceded the above scientific program.

Hardeman-Cottle-Foard-Motley Counties Society

December 9, 1953

(Reported by J. M. Taylor, Secretary)

Psychiatric Evaluation of Menopause—Henry Snyderman, Plainview.

After a dinner at the home of A. C. Traweek, Jr., of Matador, on December 9, the Hardeman-Cottle-Foard-Motley Counties Medical Society heard the above scientific paper and elected new officers. They are J. M. George, Quanah, president; C. C. Pate, Paducah, vice-president; J. M. Taylor, Quanah, secretary-treasurer; A. C. Traweek, Sr., Matador, delegate; and R. R. McDaniel, Quanah, alternate. J. F. Hughes, Spur, and P. L. Salkeld and E. A. Vestal, Quanah, were elected to the board of censors.

Harris County Society

November 10, 1953

Charles D. Reece assumed the presidency of the Harris County Medical Society at the group's November 10 meeting in Houston. Louis E. Williford became president-elect; S. G. Ohlhausen, vice-president; William M. Wallis, secretary; and Mavis P. Kelsey, treasurer. Also named were the following board and committee members: James Greenwood, executive; Eugene L. Slataper, censors; Lawrence W. Johnson, Jackson A. Smith, and Mylie E. Durham, Jr., medical jurisprudence and public relations; and Moise D. Levy, Jr., Ralph Liles, and William D. Seybold, adjudication and medical testimony. John K. Glen, C. Forrest Jorns, Denton Kerr, Herbert L. Alexander, J. Stanley Oliver, and Bill Robins are delegates; and William M. Sherrill, Hiram P. Arnold, Hampton C. Robinson, Edward S. Crocker, Wendell H. Hamrick, and John T. Armstrong, alternates.

Hill County Society

November 10, 1953

Emergency Treatment of Chest—G. V. Brindley, Jr., Temple.

The Hill County Medical Society met November 10 in Hillsboro to hear the above scientific paper. The group voted to hold a joint meeting with the local cancer group on December 14 in Hillsboro.

Lubbock-Crosby Counties Society

December 1, 1953

(Reported by Clyde F. Elkins, Acting Secretary)

Following a dinner given by J. A. Chatman at the Chatman Hospital in Lubbock on December 1, an election of officers was held by the Lubbock-Crosby Counties Medical Society. Frank C. Goodwin became president; Sam C. Arnett, vice-president; Richard K. O'Loughlin, secretary; Clyde F. Elkins, treasurer; Ewell L. Hunt, censor for three years; and William H. Gordon, delegate for two years. James T. Hall has two more years to serve as censor; E. E. McClure, one more year. Albert G. Barsh remains a delegate, and Allen T. Stewart and Arthur Jenkins remain alternates. All officers are from Lubbock.

The revised constitution, which had been mailed previously to each member, was unanimously accepted. E. A. Rowley, Amarillo, discussed raising money for the American Medical Education Foundation; Frank Malone, Lubbock, spoke about the Bricker Amendment.

January 5, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Painful Low Back—R. Q. Lewis, Lubbock.
Discussion—Charles Ratcliff, Elbert Loveless, William Cashion, Lubbock.

Before hearing the above discussion on January 5 in Lubbock, the Lubbock-Crosby Counties Medical Society held a business session, presided over by Frank C. Goodwin, new president. Allen T. Stewart explained the procedure for obtaining honorary membership in the Texas Medical Association; O. B. Hull discussed the television programs planned by the society; Roy Riddel announced plans for a banquet and social hour to be held January 12; and Frank Malone made an announcement about the state conference for county society presidents and secretaries scheduled for January 23 at the Association's headquarters building in Austin.

Nueces County Society

December 8, 1953

(Reported by William E. Morris, Secretary)

Hugh A. Kennedy assumed the presidency of the Nueces County Medical Society and conducted an election of officers at the December 8 meeting in Corpus Christi. New officers are William E. Morris, president-elect; C. B. Slabaugh, vice-president; G. S. Ahern, secretary; A. L. Lane, treasurer; L. C. Arnim, F. W. Hartwick, and R. G. Spann, censors; C. P. Yeager and J. F. Pilcher, delegates; H. E. Griffin and L. M. Garrett, alternates; and W. E. Riley and Joseph Alsop, cancer clinic directors.

The society voted to raise the salary of the executive secretary and to have the dues remain $110 for 1954. The diabetic committee reported that 5,723 tests were taken during Diabetic Week, with 16 positive cases reported. M. C. Kendrick gave a resumé of the society's activities for the past year in his president's report.

January 12, 1954

(Reported by Gerald S. Ahern, Secretary)

Pheochromocytoma, Its Diagnosis and Management—Nicholas C. Hightower, Temple.

The Nueces County Medical Society met January 12 in Corpus Christi and heard the above scientific discussion. Ralph Cameron, O. S. Carlson, Stanley Dolch, Jr., and A. F. Kiel were elected to membership. The following medical officers from the Corpus Christi Naval Air Station attended the meeting: D. O. Coffman, B. R. Malpass, William Russell, and A. B. Stephens, Jr.

A resolution from the United Fund, Inc., praising the society for its support of the drive and its contribution to the health and welfare of the community, was read.

Tarrant County Society

November 17, 1953

(Reported by S. W. Wilson, Secretary)

Investments for Professional Man—Paul Hastings, Ph. D.; Mr. F. L. Hargis; and Mr. Roy Stevenson, Fort Worth.

The Tarrant County Medical Society and the Fort Worth District Dental Society held a joint dinner meeting November 17 in Fort Worth. Seventy-eight society members, forty-two dentists, and three guests heard the above panel discussion following the dinner. A resolution presented by T. L. Lauderdale expressing the society's opposition to the Ives Bill (United States S. 1153), which "would actually mean federal subsidization of the voluntary plans, medical education and health facilities," and would "make them a vehicle for the complete socialization of medical care," was adopted.

December 1, 1953

(Reported by S. W. Wilson, Secretary)

New officers were elected December 1 in Fort Worth by the Tarrant County Medical Society. They follow: C. S. E. Touzel, president-elect; J. Franklin Campbell, vice-president; S. W. Wilson, secretary-treasurer; John Wiggins, censor; William Crawford, member of the board of trustees; Mal Rumph, James D. Murphy, and H. T. Jackson, delegates; and Robert C. Stow, J. H. Steger, Drue O. D. Ware, and Fred B. Aurin, alternates.

A motion by Dr. Murphy making the insurance committee permanent and stating its function was passed.

December 15, 1953

(Reported by S. W. Wilson, Secretary, and Joseph F. McVeigh, Chairman, Public Relations Committee)

Gold-Headed Cane: Modern Symbol of Aesculapian Staff—William J. Kerr, near Eureka, Calif.

Two hundred and forty-five members and their wives attended the annual "Gold-Headed Cane" dinner sponsored by the Tarrant County Medical Society December 15 in Fort Worth and saw R. J. White receive the award from May Owen, the 1952 winner.

Dr. Kerr, who is a retired professor of medicine at the University of California and editor of the new edition of the "Gold-Headed Cane," gave the above address and displayed several canes from his collection.

January 5, 1954

(Reported by S. W. Wilson, Secretary)

The Tarrant County Medical Society held its inaugural banquet January 5 in Fort Worth with approximately 300 members and guests in attendance, including officials of the Texas Medical Association and medical officers of the United States Public Health Service Hospital and of Carswell Air Force Base, Fort Worth.

R. J. White was master of ceremonies, and Bishop Thomas K. Gorman of the Fort Worth-Dallas Catholic Diocese was guest speaker. William P. Higgins, Jr., incoming president, was presented with the gavel by William Crawford, outgoing president.

Taylor-Jones Counties Society

November 11, 1953

Local and State Tuberculosis Situation—Travis Smith, Abilene.
Childhood Tuberculosis, Testing and BCG—Dale Johnson, Abilene.
Medical Treatment of Tuberculosis—Frank Carman, Dallas.
Indications for Surgical Treatment of Tuberculosis—Walter Park, San Antonio.

A scientific and business session was held by the Taylor-Jones Counties Medical Society November 11 in Abilene. New officers were elected and the program as outlined above was presented. J. C. Duff, who is mayor of Anson, became president; C. A. McFadden, vice-president; Marshall Turnbull, secretary; Travis Smith, censor; and R. W. Varner, delegate. All officers except Dr. Duff are from Abilene.

Tom Green-Eight County Society

November 2, 1953

Diagnosis of Types of Pneumonia—John Chapman, Dallas.

Dr. Chapman, who is assistant dean of graduate and postgraduate education at Southwestern Medical School of the University of Texas, addressed the Tom Green-Eight County Medical Society at its November 2 meeting in San Angelo and used slides of roentgenograms to illustrate the variety of pneumonias.

R. M. Arledge became president for 1954; T. G. Coleman, president-elect; K. B. Round, vice-president; and Joe L. Cornelison, secretary-treasurer. All officers are from San Angelo.

January 4, 1954

(Reported by Joe L. Cornelison, Secretary)

A program by the Parkland Tumor Clinic panel of Dallas comprised the January 4 meeting of the Tom Green-Eight County Medical Society in San Angelo.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

January, 1954

(Reported by S. E. Thompson, Secretary)

Problems of Industrial Insurance—Mr. Dan W. Jones, Houston.

At the January meeting of the Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society in Richmond, Mr. Jones spoke on the above subject from an insurance company's viewpoint. He is claims manager for Travelers Insurance Company.

Forty-three society and auxiliary members attended.

Wichita County Society

November 10, 1953

Diagnosis, Prognosis, and Treatment of Intracranial Tumors—Albert P. D'Errico, Dallas.

The Wichita County Medical Society heard the above scientific discussion at its November 10 meeting in Wichita Falls. Dr. D'Errico is professor of neurosurgery at Southwestern Medical School.

James T. Lee has been named president of the society; Roger W. Manar, president-elect and vice-president; David Allen, secretary-treasurer; J. D. Hall, delegate; Aubrey Cox, alternate; and L. N. Simmons, censor. All are of Wichita Falls.

DISTRICT SOCIETIES

Twelfth District Society

January 12, 1954

(Reported by Walter B. King, Jr., Secretary)

Extrophy of Bladder—James Hejtmancik, Waco.
Pulmonary Embolus: Its Prevention and Treatment—R. D. Holt, Jr., Meridian.
Survey of Waco Tornado Casualties—R. K. Gassler, Waco.
Can Private Practice Survive?—F. J. L. Blasingame, Wharton.
Emergency Treatment of Fractures of Mandible and Maxilla—Joe Rutherford, D.D.S., Waco.
Value of Blood Volume Determinations in Gastrointestinal Disease—Nathan Cedars, Stephenville.
Vertigo: Etiology, Type, and Treatment—Vance Terrell, Stephenville.

The program outlined above was presented when the Twelfth District Medical Society met January 12 in Waco. Dr. Blasingame, President-Elect of the Texas Medical Asso-

ciation and member of the Board of Trustees of the American Medical Association, was luncheon speaker. Approximately eighty-six doctors and wives attended.

Neil Buie, Marlin, became president; Van D. Goodall, Clifton, was elected president-elect and Paul H. Mitchell, Corsicana, secretary-treasurer.

Thirteenth District Society

March 24, 1954

(Reported by Robert D. Moreton, Secretary)

When the Thirteenth District Medical Society meets at the Fort Worth Academy of Medicine building March 24, special emphasis will be laid on acquainting members with the items of importance which are to come before the House of Delegates of the Texas Medical Association six weeks later. A luncheon panel made up primarily of officials of the Association will be present to explain the reports, resolutions, and recommendations which it is anticipated will create the most interest at the annual session and the adoption of which would have the most far-reaching effects. Those attending the district meeting can go home better prepared to discuss with their colleagues the pending business of the Association and the stand which delegates from the county societies should take.

Physicians from areas adjacent to the Thirteenth District are invited to attend the one day meeting in Fort Worth, which will include panel discussions on diseases of muscles and lesions of the colon. The Woman's Auxiliary is planning entertainment for visiting ladies.

No registration fee will be charged at the district meeting, registration for which will open at 9 a. m., but luncheon tickets will be on sale.

AUXILIARY SECTION

COMMUNITY SERVICE

"Human life," it has been said, "consists in mutual service." The Woman's Auxiliary to the Texas Medical Association pays homage to this point of view in recommending a program of activity which calls for individual as well as group cooperation with other community agencies working for the betterment of health. By contributing their share of time, energy, and knowledge to other organizations which have some of the same ideals as the medical auxiliary, Mrs. E. W. Coyle of San Antonio, President of the State Auxiliary, points out, physicians' wives can achieve greater results than if they worked alone and at the same time can create among those with whom they labor a greater understanding and sympathy for the medical profession and its objectives.

The Constitution of the Woman's Auxiliary to the Texas Medical Association states that the primary object of the organization shall be "to extend the aims of the medical profession, through the wives of the doctors, to other organizations which look to the advancement of health and education." Furnishing a speaker on first aid for home accidents for a local parent-teacher association, rolling bandages for the local cancer society, raising funds to cover the health and character building agencies within the United Fund or Community Chest, taking gifts to an old people's home—all of these and many more similar projects are included in the programs of county medical auxiliaries. They help do a job that needs doing; they also help to develop an awareness of the medical profession and a feeling that it is contributing in a positive way to the welfare of the community.

Civil defense, mental health, and nurse recruitment committees of the medical auxiliary almost automatically find themselves working in cooperation with other groups concerned with the same areas, Mrs. Coyle says. Essay contest, legislative, American Medical Education Foundation, physical examinations, and Today's Health committees have an opportunity to take medicine's message to others, for none of the topics with which they deal is for doctors and doctors' wives alone. Some of the other committees which customarily function in the medical auxiliary likewise are challenged to interpret the point of view of the medical profession while serving the community, and the program and public relations committees are concerned largely with this interplay of community and auxiliary member.

In these days when both the motives and the methods of the medical profession seem to be under fire, perhaps it is right for the Woman's Auxiliary to the Texas Medical Association to think first of the desirable public relations which will be built through cooperation in the community. Nevertheless, Mrs. Coyle reminds, real service for its own sake cannot help but foster the mutual understanding and respect upon which good public relations must be established.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. E. W. Coyle, San Antonio; President-Elect, Mrs. Mark H. Latimer, Houston; First Vice-President (Organization), Mrs. John D. Gleckler, Denison; Second Vice-President (Physical Examinations), Mrs. Cecil O. Patterson, Dallas; Third Vice-President (Today's Health), Mrs. Ralph B. Payne, Amarillo; Fourth Vice-President (Program), Mrs. Guy Knolle, Houston; Recording Secretary, Mrs. Paul Brindley, Galveston; Corresponding Secretary, Mrs. Charles L. McGehee, San Antonio; Treasurer, Mrs. Oscar M. Marchman, Jr., Dallas; Publicity Secretary, Mrs. Allen H. Neighbors, Jr., Austin; Parliamentarian, Mrs. H. S. Renshaw, Fort Worth.

COUNTY AUXILIARIES

More than 300 dolls were collected for the Christmas Clearing Bureau's gift baskets by the *Bexar County Auxiliary*. With Mrs. John Parsons as coordinator, publicity was sent to various clubs belonging to the City Federation, and many nursery schools also cooperated. The group honored the doctors December 12 with a dinner dance in San Antonio; Mrs. F. G. Lahourcade was social chairman for the affair.

Sixty couples attended the annual Christmas open house of the *Nueces County Auxiliary* December 6 at the home of the C. D. Dixons, Corpus Christi. Mrs. C. D. Stewart, chairman; Mrs. Sterling Martin, co-chairman; Mrs. Sam Powell, president; and Mrs. Dixon were hostesses.

"Here I Stand," a book by Roland Bainston, was reviewed by Mrs. J. M. Spurlock in observance of Bible Day by the *Hunt-Rockwall-Rains Counties Auxiliary* November 3 in the home of Dr. and Mrs. Grady Bruce, Greenville. Members answered roll call with quotations from the Bible on health. The speaker was presented by Mrs. S. D. Whitten, and Mrs. C. D. Savage, president, presided over the business session.

"Books" was the topic discussed by Mrs. E. W. Grumbles, Atlanta, at the November 18 meeting of the *Cass-Marion Counties Auxiliary* at Linden. The meeting followed a dinner with the society. On January 13 following dinner with the doctors, the auxiliary met at the home of Dr. and Mrs.

T. K. Nichols, Atlanta, to complete final reports for the year's work. A social hour ended the evening.

The annual Thanksgiving dinner of the *Cherokee County Auxiliary* and society held at the Rusk State Hospital November 24 was followed by an all-patient program. Dr. C. L. Jackson, superintendent, acted as toastmaster.

"Personality Development in Children" was discussed by Dr. George Schlenker at the January 11 meeting of the *El Paso County Auxiliary.* Mrs. Clement C. Boehler, mental health chairman, was in charge of the program. The Bricker Amendment was discussed by Mrs. Louis Breck, and copies of "You Can Lose Your Freedom Overnight by Treaty—Protect It by Bricker Amendment," prepared by the auxiliary, were distributed. Poll taxes were sold at the meeting, which was preceded by a luncheon, the chairmen for which were Mrs. Morton Leonard and Mrs. Jack Bernard. The auxiliary honored Dr. and Mrs. George Turner at a dinner dance November 28 at the Hilton Hotel in El Paso as its Doctor's Day celebration; Mrs. Frank Schuster was chairman. Dr. Turner is President of the Texas Medical Association, and Mrs. Turner is President-Elect of the American Medical Association's Woman's Auxiliary.

The *Navarro County Auxiliary* observed Doctor's Day January 8 with a dinner in Corsicana. Dr. Robert Kimbro, Cleburne, chairman of the Board of Trustees of the Texas Medical Association, was speaker. Throughout the day the doctors of Corsicana wore red carnation boutonnieres presented to them by their wives. Mrs. Paul H. Mitchell and Mrs. W. K. Logsdon were hostesses for the dinner. Mrs. Kimbro also attended.

"The Doctor's Wife in Fashion" was the theme of a luncheon-style show given November 4 in Dallas by the *Dallas County Auxiliary.* Mrs. Everett C. Fox was chairman of the program.

Jimmie Angel, business manager of the Kerrville State Home, told the *Kerr-Kendall-Gillespie-Bandera Counties Auxiliary* about "Care of the Aged" at the group's meeting November 6 in Kerrville.

Mrs. Edward W. Coyle, San Antonio, State President, was honor guest at several county auxiliary functions throughout the state recently. The *Tom Green-Eight County Auxiliary* honored her with a luncheon at the home of Dr. and Mrs. M. D. Knight, San Angelo, in the early part of November, as did the *Nolan-Fisher-Mitchell Counties Auxiliary* at Sweetwater, Mrs. T. D. Young presiding. Mrs. Coyle also was guest at a dinner meeting November 10 in Abilene of the *Taylor-Jones Counties Auxiliary,* at which meeting Mrs. T. B. Bass gave the invocation; Mrs. Sol Estes, president, recognized local members who were state officers; and the silver cup won by the group at the 1953 annual session for acquiring the greatest number of new members was displayed. Mrs. Coyle discussed the phases of State Auxiliary work with stress on the field of mental health.

DEATHS

W. E. MARTIN

Dr. Walter Evans Martin, Dallas and Seagoville, Texas, died October 15, 1953, in a Dallas hospital after a stroke.

DR. WALTER E. MARTIN

Born in Deport, August 15, 1897, Dr. Martin attended East Texas State Teachers College, Commerce, and the University of Texas, Austin, and was graduated from Wesley College, Greenville. He taught school in Lamar County, later becoming superintendent of Lamar County public schools, before beginning his medical work. He was graduated from Baylor University College of Medicine, Dallas, in 1931 and practiced medicine in Paris briefly before locating in 1932 in Dallas. Dr. Martin organized a group practice at his offices in Dallas and founded the East Dallas Hospital. Two years ago, he moved to his ranch in Seagoville.

Dr. Martin was a current member of the American Medical Association and Texas Medical Association through Dallas County Medical Society. He was a member and past president of the Dallas County Chapter of the American Academy of General Practice and belonged to the Dallas Southern Clinical Society. For many years, he was a steward in the Methodist Church. He was a Mason and former president of the J. L. Long Dad's Club.

Dr. Martin is survived by his wife; two sons, Oscar W. Martin and Wayne E. Martin, both of Seagoville; a daughter, Dr. Robbie Jo Shires, Dallas; a brother, Lee H. Martin, Tahoka; and six sisters, Mrs. Jessie Reece and Mrs. Belle Griffin, both of Dallas; Mrs. Bessie Barham and Mrs. Alice Westbrook, both of Deport; Mrs. Dora Watkins, Fort Worth; and Mrs. Joe Merrell, Kemp.

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

L. M. REAVES

Dr. Lovett Martin Reaves, Dallas, Texas, died at a local hospital, January 2, 1954, of myeloma.

The son of Mr. and Mrs. B. A. Reaves, Dr. Reaves was born December 17, 1904, in Warren, Ark. He received his preliminary education in Warren public schools and attended Henderson-Brown College, Arkadelphia, Ark. After being graduated in 1929 from the University of Arkansas School of Medicine, Little Rock, he served an internship at St. Paul's Hospital, Dallas. For twenty-three years, he had maintained a private practice of medicine in Dallas.

Dr. Reaves belonged to the American and Texas Medical Associations through Dallas County Medical Society and was a member of the Texas Academy of General Practice, Dallas Southern Clinical Society, and Phi Chi medical fraternity. He was a thirty-second degree Mason and a member of the Shrine, and served on the board of stewards of the Highland Park Methodist Church.

For three years during World War II, he was a captain and later a lieutenant colonel in the Medical Corps, serving in the Asiatic Pacific theater for fifteen months in 1944 and 1945.

His wife, the former Miss Allan Wells, whom he married July 15, 1934, survives, as do two daughters, Carol Reaves and Jane Reaves, Dallas; his mother, Mrs. B. A.

DR. L.. M. REAVES

Reaves, Warren, Ark.; two sisters, Miss Mary C. Reaves, El Dorado, Ark., and Mrs. E. F. Carter, Shreveport, La.; four brothers, Lee Reaves and Hugh Reaves, Warren, Ark.; Glenn Reaves, Houston; and Noel Reaves, Oklahoma City.

R. D. MOORE, JR.

Dr. Rufus Dillard Moore, Jr., died of myocardial infarction November 30, 1953, at his home in Houston, Texas.

The son of Dr. Rufus Dillard and Emily Jessie Moore, Dr. Moore was born in Omaha, Texas, May 25, 1910. He attended Omaha public schools and Lon Morris College, Jacksonville. He received a bachelor of arts degree from Southern Methodist University, Dallas, and bachelor of science and master of arts degrees from East Texas State Teachers College, Commerce. After receiving his medical degree in 1935 from the University of Arkansas School of Medicine, Little Rock, he served an internship at Little Rock City Hospital.

For four years Dr. Moore practiced at Mount Pleasant. He then served from 1941 to 1946 with the Army Medical Corps, completing his tour of duty in executive positions in Chicago and San Francisco and being discharged as a lieutenant colonel. More recently he had been a colonel in the Medical Reserve Corps. In 1946 Dr. Moore returned to Omaha and practiced there for two and a half years before moving to Houston.

A member of the American and Texas Medical Associations through Harris County Medical Society, Dr. Moore was formerly a member of Titus and Morris Counties Medical Societies. He belonged to the Southern Medical Association, American Geriatrics Society, American Academy of General Practice, American Association of Military Sur-

DR. RUFUS D. MOORE, JR.

geons, and Reserve Officers Association. He also was a Scottish Rite and York Rite Mason, a member of the Shrine, and a member of the Eastern Star. He held membership in the Variety Club and belonged to the Methodist Church.

His survivors include his wife, the former Miss Sally Reba Newman, whom he married in Forrest City, Ark., December 31, 1936; his mother, Mrs. R. D. Moore, Sr., Omaha; and a brother, J. Marion Moore, Dallas.

J. T. LAWSON

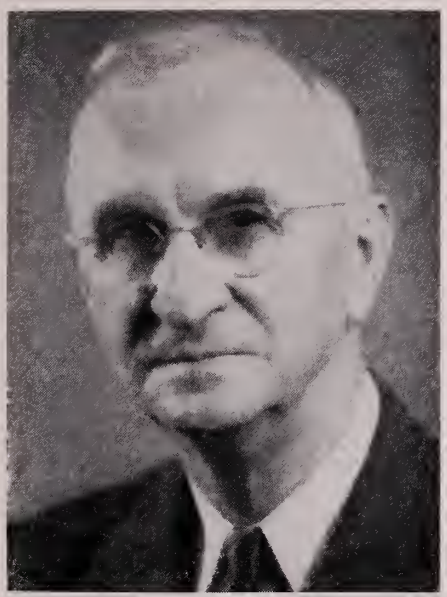
Dr. John Thomas Lawson died December 12, 1953, at his home in Bowie, Texas, after suffering a heart attack.

Dr. Lawson was born November 23, 1876, at Talladega, Ala., the son of Thomas E. and Julia A. Lawson. In 1887, he came to Cleburne with his parents. After being graduated in 1899 from the old Memphis Hospital Medical College, Memphis, Tenn., which was consolidated with the University of Tennessee College of Medicine in 1913, Dr. Lawson located at Files, where he practiced for six years. He then moved to Bowie and did general practice and surgery before taking special work and entering the field of diseases of the eye, ear, nose, and throat. He had taken many postgraduate courses in medicine and surgery at various medical centers in Chicago and St. Louis.

Dr. Lawson was a member of the American Medical Association and Texas Medical Association through Clay-Montague-Wise Counties Medical Society. He served as president of Hill County Medical Society before moving to Bowie, and had served as both president and secretary of Montague County Medical Society before assisting in organizing and becoming first president of the Clay-Montague-Wise Counties society. In 1915, he was president of the Thirteenth District Medical Society. He belonged to the Dallas Academy of Ophthalmology and Otolaryngology. President of the Texas State Board of Medical Examiners

for four years and member of the Board for twelve years, Dr. Lawson was city health officer at Bowie and local surgeon for the Fort Worth and Denver Railroad Company and the Rock Island Lines. He had been a member of the Bowie Clinic and on the staff of the Bowie Clinic Hospital since they were organized. He was a member of the Fifty Year Club.

Dr. Lawson served in the Medical Corps of the United States Army during World War I. A one time director of Texas Agricultural and Mechanical College, he was director and twice president of the Bowie Chamber of Commerce. He served as manager of the Bowie Public Welfare Association during the depression years, was past commander of the local American Legion Post, vice-president of the Security National Bank of Bowie, and past president of the Bowie Rotary Club. Among his other interests were real estate, land, cattle, and oil.



DR. JOHN T. LAWSON

Recently, Dr. Lawson had been honored by the University of Tennessee College of Medicine with the presentation of a Golden "T" award for his services to his school and to his community.

Dr. Lawson married the former Miss Edna McKey at Files in 1900. Their son, Dr. J. Mack Lawson, a Fort Worth surgeon, died in 1951. Surviving Dr. Lawson are his wife; a daughter, Mrs. Lucille Head of Ely, Nev.; five grandchildren; and three great-grandchildren.

A. L. RIDINGS

Dr. Alfred Lafayette Ridings, formerly of Sherman, Texas, died December 16, 1953, in a Washington, D. C., hospital of coronary thrombosis.

Dr. Ridings was born in Ivanhoe, March 7, 1879, the son of Perry Pinckney and Mildred (Davis) Ridings. He received his academic education at Ivanhoe and Bonham public schools, and was graduated an honor student from the University of Louisville School of Medicine, Louisville, Ky., in 1910. He practiced in Dorchester before moving in 1916 to Sherman, where he lived until his retirement in 1949 after suffering a stroke. Dr. Ridings had been living with his daughter in Washington since that time.

A member for many years of the Texas Medical Association, he was elected to honorary membership in 1950. He served as Vice-President of the Association in 1934 and as secretary of the Section on Surgery of the Association's 1937 annual session. Dr. Ridings was a former president of the Grayson County Medical Society and the Fourteenth District Medical Society. He held membership in the Texas Railway and Traumatic Surgical Association and was a fellow of the American College of Surgeons. At the time of his retirement he was on the staff of the Wilson N. Jones Hospital and a member of the Stout (now Medical Arts)

DR. ALFRED L. RIDINGS

Clinic. He belonged to the Sherman Kiwanis Club, Masonic Lodge, and the Baptist Church.

Dr. Ridings was a captain in the United States Army Medical Corps in World War I and served as a member of the medical advisory board to the Selective Service system in World War II. He was awarded a presidential citation and a Selective Service medal in 1945 for his work during World War II.

His wife, the former Miss Grace Dupree, whom he married in Bonham in March, 1900, was a Texas poet and an official in several state and national literary and patriotic groups. She died in 1941.

Surviving Dr. Ridings are his daughter, Mrs. Hope Ridings Miller, magazine writer, of Washington, D. C., and a nephew, Dr. Ridings E. Lee of Dallas.

W. L. ROBINSON

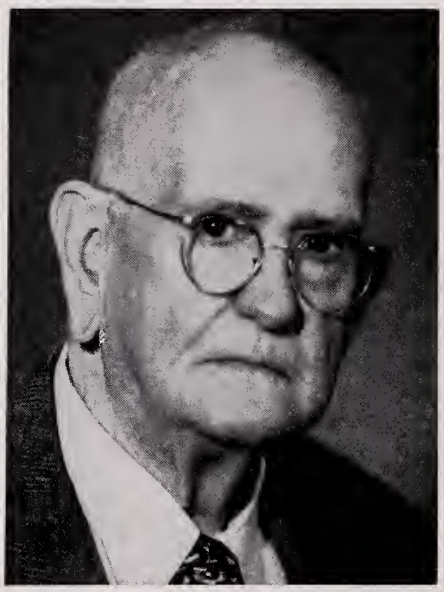
Dr. William Lee Robinson of Texarkana, Texas, died December 22, 1953, of coronary occlusion.

Born the son of William Wirt Bonner and Mary Susan (Irvine) Robinson, August 3, 1876, in Eureka, Navarro County, Texas, Dr. Robinson received his academic education in Eureka, Zions Rest, and Corsicana. He attended Texas Agricultural and Mechanical College, College Station, where he studied engineering, and the University of Texas College of Pharmacy, Galveston. He received his medical degree from the University of Texas School of Medicine, Galveston, in 1903. In 1904, Dr. Robinson was house physician at St. Joseph's Infirmary in Houston. After serving an internship at John Sealy Hospital, Galveston, he practiced in Montgomery, Navarro, and Hill Counties be-

fore moving in 1920 to Dallas. He served for twenty years as visiting physician at Parkland Hospital, Dallas. From 1941 to 1950, he was a physician for Austin State School, Austin. He then returned to Dallas and became superintendent of the County Convalescent Home. Two years later he was resident physician at the Beverly Hills Sanitarium, a post he held until December, 1952, when he moved to Texarkana and served as plant physician for the Lone Star ordnance plant there.

Dr. Robinson belonged to the Texas Medical Association through Dallas County Medical Society. He previously had belonged to Navarro, Hill, and Travis Counties societies. He also was a member of the Southern Medical Association.

Dr. Robinson was in the Spanish-American War, served as a captain with Gen. John J. Pershing in his expedition



DR. WILLIAM LEE ROBINSON

to Mexico in 1915, and was a major in the infantry during World War I.

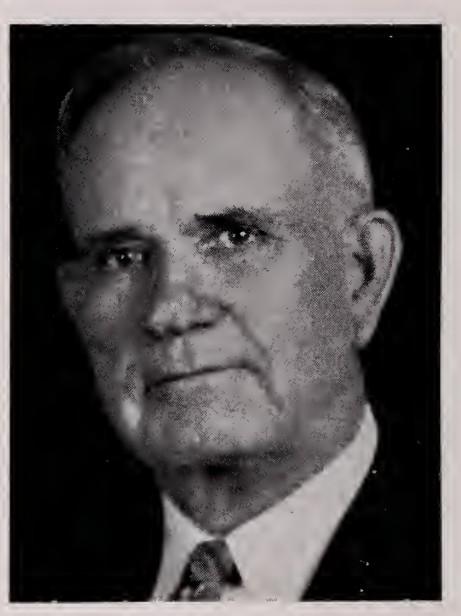
A great-nephew of Confederate Gen. Robert E. Lee, Dr. Robinson was an honor guest when President Franklin D. Roosevelt unveiled the statue of the general in Dallas' Lee Park in the 1930's. He was commander of the Sons of Confederate Veterans. He belonged to the Order of the Green Snake (an organization of Spanish-American War veterans), the American Legion, Veterans of Foreign Wars, and High Noon Club, and served as vice-president for the Sons of the Texas Revolution. He was a thirty-second degree Mason and a member of the Presbyterian Church.

Dr. Robinson is survived by his wife, the former Miss Charlotte Mayfield, Dallas; one son, William Lee Robinson, Jr., Austin; three daughters, Mrs. Roy Nunnally, Hawaii; Mrs. Mayme Sue Murray, Dallas; and Mrs. John B. Matney, San Angelo; two sisters, Mrs. Justin Harrison, Dallas, and Mrs. M. T. Horne, Galveston; two brothers, E. E. Robinson, Dallas, and Dr. H. Reid Robinson, Galveston; four grandchildren; and one great-grandchild.

M. A. FORBES

Dr. Marrell Allen Forbes, San Antonio, Texas, died in that city on January 6, 1954, of coronary occlusion.

A native of Whitehouse, Williamson County, Dr. Forbes was born February 28, 1873, the son of John Alexander and Virginia (Barfield) Forbes. After studying at public schools in Williamson, Burnet, and Tom Green Counties and at the University of Texas Medical Branch, Galveston, Dr. Forbes was graduated in 1901 from Tulane University of Louisiana School of Medicine, New Orleans. He practiced in Beyersville, Kenedy, and Corpus Christi before going to New York for a year as resident at Bellevue Pediatric Clinic. In 1910, he moved to San Antonio, where he spent the remainder of his professional career, and was local surgeon for the San Antonio and Aransas Pass Railway for several years. He was instrumental in the establishment of the first charity children's hospital in San Antonio before the Robert B. Green Hospital was opened in 1916. A member of the State Militia, Dr. Forbes was drillmaster at Camp Mabry, Austin, in 1890-1891, and was a civilian medical examiner in San Antonio for the United States Army during World War I. In honor of the golden anniversary of his graduation, Dr. Forbes along with twenty-eight classmates in 1951 received a "second medical degree" from Tulane and was a guest at a special luncheon in New Orleans.



DR. M. A. FORBES

An honorary member of the Texas Medical Association since 1951 and a member almost continuously since 1904, Dr. Forbes also belonged to the American Medical Association, the Bexar County Medical Society, and the Presbyterian Church. He was a Royal Arch Mason, a thirty-third degree Scottish Rite Mason, and a member of the Shrine. Dr. Forbes was twice master and a life member of the local Masonic Lodge and had served as district deputy grand master of Texas for the thirty-ninth Masonic district and both grand orator and grand visitor of the Grand Lodge of Texas. He was also a member of the board of directors of the Scottish Rite Dormitory at the University of Texas, Austin, from 1943 to 1949 and chairman of the executive committee of the Scottish Rite bodies in San Antonio from 1945 to 1949.

Survivors include his wife, the former Miss Vance Word, whom he married February 4, 1906, at Kenedy; a daughter, Miss Muriel Forbes, San Antonio; two sons, C. A. Forbes, Georgetown, and Dr. M. Allen Forbes, Jr., Austin; and four grandchildren.

KNOW YOUR STATE HEALTH DEPARTMENT

Public health is a concern of organized medicine and a working interest should be taken to see that there is coverage in areas lacking it. The function of our public health services is the prevention of disease through the application of sanitary engineering methods, quarantine, vaccination, and case finding. This work is closely related to medical care, particularly in the fields of general practice and industrial medicine. The Texas Medical Association Committee on Public Health works as a coordinating council between the activities of public health workers and practicing physicians. Individual physicians and county medical societies can greatly assist in this worth-while public service by insisting on efficient public health coverage in all communities.

Sixteen separate bureaus and divisions perform the many functions incident to state public health service operations as follows:

The Bureau of Vital Statistics registers all births and deaths in Texas and furnishes certified copies of these records.

The Bureau of Food and Drugs is charged with the enforcement of the Pure Food and Drug Laws of Texas.

The Public Health Education Division prepares and distributes spot announcement radio script and programs to Texas radio stations, prepares and distributes news releases to Texas newspapers, distributes movies, and publishes a monthy magazine.

The Bedding Division enforces the Texas statutes regulating the manufacture, sale, sterilization, and labeling of bedding.

The Bureau of Laboratories tests samples collected by the Bureau of Food and Drugs and the Venereal Disease Control Division, and also types blood donations, prepares and stores blood plasma, and performs other services.

The Bureau of Sanitary Engineering directs the enforcement of laws governing water purification, stream pollution, and sewage disposal. The control of insects and rodents, air pollution, and sanitary consulting services are also functions of this bureau.

The Venereal Disease Control Division is engaged in educational activities and venereal disease case finding, in cooperation with physicians, city and county health units, and local welfare and civic groups.

The Tuberculosis Control Division conducts mass surveys by chest x-ray microfilms in cooperation with local health units, civic clubs, PTA's, churches, and other organizations.

The Local Health Service Division acts as adviser and supervisor to local health units in epidemiology, conducts in-service training for public health personnel, and prepares reports on the status of public health in Texas.

The Maternal and Child Health Division offers educational and advisory service to the general public in pediatrics and obstetrics, and acts as consultant in health programs for the school child.

The School Health Services Division promotes public school education in the control of communicable disease, instruction in nutrition, school sanitation, and adequate physical activities.

The Dental Health Division conducts educational programs in dental health, and in certain localities of the state offers clinical services to underprivileged children and expectant mothers.

The Public Health Nursing Division renders service programs for the control of venereal disease, tuberculosis, cancer, and maternal and infant health; service to crippled children; and help in mental hygiene activities.

The Crippled Children's Division offers free clinical service to underprivileged crippled children and purchases braces, artificial limbs, wheel chairs, and other devices to aid the crippled child.

The Cancer Control Division conducts an educational program in cooperation with the Texas Division of the American Cancer Society, Texas Medical Association, Texas Dental Association, M. D. Anderson Hospital for Cancer Research, and other organizations.

The Mental Health Division promotes a mental health education program and works in cooperation with the State Board for Hospitals and Special Schools.

The Heart Disease Division was organized in 1949 for the purpose of conducting educational programs in this disease. It has remained inactive for the most part because of lack of personnel for this work.

TEXAS HOST TO RURAL HEALTH CONFEREES: American Medical Association's Ninth National Conference on Rural Health saw Texas host to biggest meeting yet. In Dallas, March 4 through 6, the conference drew strong representation from farm, chamber of commerce, and education fields as well as the medical profession from throughout the nation. Dr. Allen T. Stewart, Lubbock, regional director of AMA's Council on Rural Health, presided over opening session, and Dr. Chester Callan, chairman of the Texas Medical Association's Committee on Rural Health, spoke on "A Planned Approach to Doctor Distribution." Texas President, Dr. George Turner, El Paso, brought state greetings. Host arrangements went smoothly through under direction of Dallas County Medical Society. The state Association furnished assistance to AMA staff members in handling press coverage.

Dr. Callan's report summarized detailed study on doctor distribution in Texas as well as pilot survey of District 7 under Dr. J. M. Coleman, Austin, Councilor. Conferees heard that all communities over 800 population in the Central Texas area were asked whether additional doctors were needed and were supplied with information on attracting, as well as holding doctors. Dr. Callan noted that no community requests for help were received, reported that the addition of a competent Texas Medical Association field secretary soon would allow the survey to be extended across the entire state, held out optimistic outlook for results. He told conferees that the work of his special state Committee on Doctor Distribution was trying to accomplish the dual job of dispelling the oft-used misnomer of "doctor shortage" and at the same time of discovering actual areas of improper distribution and doing something about them.

Dr. Callan reported Texas Medical Association's desire to cooperate with local medical-lay groups wishing to establish community rural health committees.

The Association has asked chambers of commerce, local farm bureaus, and other groups properly interested in rural health problems to contact local county medical societies. Material for guidance in planning, establishing, and carrying through such committees will be furnished on request to the Association's central office in Austin. The material parallels work by AMA and by other states in the rural health field.

OTHER DEVELOPMENTS IN TEXAS: First reported county medical society to follow up Association's recently sponsored forum for county presidents and secretaries on the national administration's health program and its implications to medical care has been Harris County. Under the guidance of Dr. Charles D. Reece, president, Houston doctors, February 24, had occasion to listen to as authoritative a panel of speakers as that sponsored by the state Association in January. Dr. Ernest B. Howard, Chicago, Assistant Secretary of AMA, and Dr. F. J. L. Blasingame, Wharton, AMA Trustee, discussed the over-all program, and Dr. Everett C. Fox, Dallas, outlined the problems imposed by V.A. medical care. Attendance: good.

County society officers unable to attend the Presidents and Secretaries Conference in Austin may still obtain complete information kits on V.A. medical care by writing Association central office direct. Other PR aids, such as Presidents' and Secretaries' Handbook, 1954; County Society PR Outline Guide; State Program, Public Relations Committee; as well as many factual pamphlets for society or individual office guidance (see list, P. and S. Handbook, page 15), may be obtained similarly.

ON THE NATIONAL SCENE: A strong socio-economic note from the 867-member Hartford (Conn.) County Medical Association. The association recently amended its by-laws to provide its officers a strong weapon to police association ranks in matters of overcharging, as follows:

> "When a matter in controversy relates to the fee charged by a member of the Association, the Committee (on Medical Ethics and Deportment) shall hold a hearing and by majority vote, determine the fee which it deems fair and proper, after seeking the advice of three physician members who are recognized specialists or practitioners in the field concerned . . . ."

Failure to comply with committee findings may lead, via the association's board of directors, to the Connecticut State Examining Board and result in revocation or suspension of license.

Commented Hartford Times: ". . . another step by the public relations conscious organization to strengthen the position of the profession with the public by imposing shackles on any who might tear down public confidence through gross overcharging."

GREEN GRASS INSIDE THE FENCE

Elsewhere in this JOURNAL are details of the 1954 annual session of the Texas Medical Association. The scientific papers and exhibits; information on legislation, economics, and community service; and the renewal and establishment of friendships at this session May 3-5 in San Antonio are samples of the contributions which the Association can make to the life of the Texas physician.

Sometimes the contributions by this parent medical organization of the state are disparaged, and it is well to rethink the position which it holds.

Once upon a time a doctor of medicine treated any disease or injury. He and those like him organized a society in which they could discuss and evaluate methods of diagnosis and treatment, through which they could become better acquainted, and by which they could speak with greater authority to legislators and the public about health problems. The local organization joined with others of like intent to establish a statewide brotherhood, which eventually affiliated nationally with other state associations to perform services no smaller unit could accomplish.

San Antonio's beautifully designed Municipal Auditorium, where scientific sessions will be held and technical and scientific exhibits will be on display during the Texas Medical Association's annual session May 3-5, is usually the scene of symphonies, operas, and concerts by great artists. The registration desk will be housed in the Auditorium beginning May 3.

For a long time, his county, state, and national medical societies offered all of the scientific food for thought, all of the professional fellowship, and the most effective public voice the physician could want.

Then came specialization with its bevy of societies, compulsory hospital staff meet-

ings, regional assemblies where doctors are concentrated. Then came threats to the economic and social ideology upon which American medical practice is built and differences of opinion as to how far men of medicine should go as a group in opposing these threats, with the consequent mushrooming of organizations to reflect varying shades of opinion. Then came a general increased tempo of living with too many meetings and too little time.

Today the county medical society, the Texas Medical Association, and the American Medical Association, strong because of their all-inclusiveness and because of their years of experience in serving the medical profession, at the same time have tended to lose the priority which was theirs before other groups, appealing in their singleness of purpose and with an undeniable raison d'etre, diverted much vigor and zeal to their banners.

The need for all doctors of medicine, whatever their special field, wherever they practice, to recognize the basic reasons for the early organization of a medical society and to understand that they still exist is important. Other medical organizations and activities have their place, but none can substitute for the broad-based, multipurposed federacy of county, state, and national societies of doctors which for so long has been fundamental in the concept of "organized medicine" and which regularly modifies its activities to meet changing needs.

On the state level the Texas Medical Association, which has fought for citizens of the state and their doctors for more than a century, deserves the respect and support of every one of its members—the respect and support which comes with attendance at meetings, participation in committees, attention to publications and correspondence, adherence to society rules, championship of elected officials, prompt payment of dues, and genuine interest in the organization and its progress.

The program of the 1954 annual session has been evolved after long hours of concerted effort based on the expressed desires of many members of the organization. The Texas Medical Association has much to offer, but its members must accept these gifts for themselves—they cannot be forced upon them. Attendance at the annual session, attention to its scientific offerings, interest in the deliberations of the House of Delegates, and enjoyment of the Spanish-flavored entertainment may be a first step back to the rewards of active membership for any physician who has allowed his attention to wander too far afield.

PUBLIC HEALTH, A PERSONAL CONCERN

Public health is in the news in Texas because of a turnover in the position of state health officer after seventeen years. Dr. George W. Cox, often the central figure in controversies which have involved other members of the medical profession and laymen alike, is stepping down voluntarily after having a hand in reducing the prevalence of almost every category of communicable disease in Texas, increasing local health units from 4 to 48, establishing a first class state public health laboratory, constructing a State Department of Health building, organizing the international United States-Mexico Border Public Health Conference, and employing and training dozens of skilled public health craftsmen.

No one, least of all Dr. Cox, could call the job of public health in Texas complete, and it remains for Dr. Henry A. Holle, a native Texan and former practitioner in Brenham who more recently has been medical director for Regions 1 and 2 of the United States Public Health Service with headquarters in New York, to consolidate the advances made under Dr. Cox's administration and progress to still greater achievements. Dr. Holle's background as a practicing physician in his native state and wide experience in public health administration fit him ably for the post of state health officer to which he has been appointed.

Regardless of his personal and professional qualifications, however, no health officer can operate effectively either in a vacuum of indifference or under the pressure of opposition from physicians in private practice. Even though he may have the backing of a well trained corps of health officers, educators, and sanitarians, real public support and a truly effective program are affected tremendously by the attitudes and degree of cooperation of medical doctors in private practice.

Few in this day would argue that public health services have no place—case finding, prevention of disease through immunization and quarantine, and sanitary engineering are areas in which the expenditure of tax funds is conceded to be appropriate and well nigh essential. Nevertheless, there are differences of opinion about how much federal subsidy shall be accepted in a state program, about what patients shall be immunized at public expense, about how much consultation there shall be between the health officer and his colleagues in private practice before a move in the public health field is made. Sometimes these differences grow into open disputes or stubborn stalemates which are harmful to the health of the community and create undeniable ill will against the medical profession.

The chairman of the Texas Medical Association's Council on Medical Jurisprudence is chairman of the State Board of Health which appointed Dr. Holle as state health officer, and the President of the Association is a member of the board. They have assured themselves of his outstanding qualifications for the job and have offered him their support as have other members of the board. The chairman of the Board of Trustees of the Texas Medical Association has pledged his cooperation to the new appointee. It behooves practicing physicians throughout the state to greet Dr. Holle with friendliness, to be ready to discuss objectively plans for improving public health facilities and function, and to offer criticism (if it becomes necessary) in a helpful manner rather than in a deprecatory spirit. The public health official and the private practitioner must complement each other if the best scientific knowledge is to be used in our free society for the betterment of health.

PUBLIC EDUCATION AND THE PHYSICIAN

When Texas broke with Mexico, its Declaration of Independence, signed March 2, 1836, contained this charge:

> [The Mexican government] has failed to establish any public system of education, although possessed of almost boundless resources, [the public domain,] and although it is an axiom in political science, that unless a people are educated and enlightened, it is idle to expect the continuance of civil liberty, or the capacity for self-government.

The Texas Republic, despite the earlier declaration, failed to take concerted action to provide an adequate system of public education, and for almost ten years after its entrance into the United States no statewide system of schools was authorized. In January, 1854, the legislature adopted a measure designed to set up common schools in districts covering the state, each district to receive a per capita share of interest from a special fund and free instruction to be provided for children of paupers. This law had to be revised and implemented, modified and developed, but it laid the foundation for public education, and this year Texas is celebrating the centennial anniversary of its public school system.

The law of 1854 was not intended to lead to the establishment of institutions of higher learning, but eventually it became apparent that the growth of indigenous leadership would require public support of advanced cultural and professional training, and state colleges and universities began to take their place beside church supported and other private institutions. As the years went by, the University of Texas Medical Branch in Galveston was founded, and much more recently the Southwestern Medical

School of the University of Texas in Dallas, the Postgraduate School of Medicine of the University of Texas in Houston with seven divisions elsewhere in the state, and the M. D. Anderson Hospital for Cancer Research in Houston were established. Dental, nursing, pharmacy, and other paramedical educational centers also were instituted under the aegis of the state, bringing this type of training within the financial possibilities of all the sons and daughters of Texas.

Public education and democracy are so closely allied that the necessity for supporting free schools need not be argued. What public education has done for the health of Texas might well be mentioned, however.

Healing by magic and superstition, the legacy of the primitive and unlettered, has given way in large measure to healing based on scientific knowledge. This has come about partly because of the basic knowledge of hygiene which school children are taught and the readiness of educated persons to accept—and even to demand—medical care based on the principles of anatomy, bacteriology, chemistry, and physiology. It has come about partly because of the better educational facilities for the practitioners themselves, facilities which not only make it possible to pass on to students the knowledge already accumulated but also permit experimentation and research to increase the fund of knowledge.

Dr. Dana W. Atchley, professor of clinical medicine at Columbia University, wrote recently:*

. . . In this country, at least, the evolution of the physician has been a reflection of the evolution of medical education, of the medical school. When the medical school ceased being a profitable side line for a group of successful practitioners and became an integral part of the university the physician made the first step toward true dignity. He was respected, useful, and often high-minded before, but he was essentially an artisan. The keen investigative mind had shown itself repeatedly in the recognition of new disease entities and the observation of fresh relationships, but there was little awareness of the experimental method among clinicians and few opportunities for the cultivation of scientific critique. . . .

Modern medical education has helped to fashion a new creature described by Dr. Atchley thus:

. . . the physician of today, at his best, represents a fusion of the healer and the scientist. In his role he analyzes the multiple components presented by a single human being. As healer his intuitive understanding of the personality and environment is amplified by modern psychology; and scientific studies of the many facets of the structure and function of the physical machine inform him as to the existing organic status. The appraisal resulting from an integration of these data leads naturally to the special management appropriate to the particular individual. The introduction of the highest possible standards of scientific precision into clinical medicine is no deterrent to the exhibition of compassion or any of the other generous gifts of the healer. Merging the healer and the scientist combines the best capacities of both and loses nothing by the union.

The type of physician which Dr. Atchley describes is being produced by the schools supported by the people of Texas and is being looked to for medical care by those people. Without detracting from the achievements of privately supported schools and schools in other geographical areas, we can be proud of the steps taken in the past one hundred years in public education in Texas and can join hands for a still better system of schools in the future.

*Healer and Scientist, Saturday Review, Jan. 9, 1954, pp. 7-9 ff.

PLASTIC SURGERY SCHOLARSHIP

Residents in training and plastic surgeons who have been in practice no longer than five years may compete in the fifth annual scholarship contest, junior classification, sponsored by the Foundation of the American Society of Plastic and Reconstructive Surgery. Two scholarships for three months each in plastic surgery study are the main prizes. An award also will be offered for a winning essay in the senior classification, which is for those physicians active in the practice of plastic and reconstructive surgery for more than five years.

Deadline for receiving the 5,000-word essays on some original clinical or experimental research in the field is July 1. The winning essays will be presented at the group's fall meeting. Further information is available from the Award Committee, c/o Dr. Jacques W. Maliniac, 30 Central Park South, New York 19.

ORIGINAL ARTICLES

PUBLIC HEALTH AND THE PRIVATE PHYSICIAN

HENRY A. HOLLE,* M.D., New York, New York

THERE has been a good deal of loose talk about what is meant by the term "public health," and almost everyone seems to have his own definition. The World Health Organization has defined health as "a state of complete physical, mental, and social well being, not merely the absence of disease or infirmity." Regardless of which definition one uses, it is clear that the complexity of living in a modern society makes it necessary for community health to be included in community planning. Optimal health, therefore, is a community responsibility.

BASIC CONCEPTS

It is not within the scope of this discussion to describe public health programs at national, state, or local levels of government. Certain basic facts or concepts seem to merit brief mention in passing, however, in order that there might be a common ground of understanding.

Public health in medicine is a specialty which requires special training comparable with other specialties. It is a full time job which cannot be done properly between professional calls in a busy practice. Public health programs are essential and effective and their results are measurable. They cost money. They should be planned at the community level to fit community needs because no two communities are exactly alike. They will not succeed without community support. Population-wise, the jurisdictions of health departments must not be too small to be economically feasible. These basic concepts as well as several others generally have been accepted in the public health field. I should like to mention one more.

Although the federal government can render valuable advisory and other assistance, it has no jurisdiction within the states. Under our system of government, this is as it should be. One could hardly think of anything more unwieldy, or unwise, than a public health program duplicated in every community and controlled from Washington.

To a lesser degree, it follows that the same general philosophy is appropriate as regards the relationship between state and local governments. The state may have a legal responsibility to provide health protection to its citizens when local government fails to do so, but there is little question that the most effective public health job by far can be done when local autonomy is preserved.

An important part of community support should come from the private physician, and it is obvious to the experienced health officer that without it his problems become almost insuperable. The health officer makes certain, therefore, that both his objectives and his modus operandi are understood by the local profession in the planning stage before the program starts. He knows that opposition from this source will make him vulnerable to the ultimate loss of other vital community support.

The private physician who is familiar with community public health work rarely is unwilling to support any reasonable program. He recognizes the public health physician and his staff as valuable allies and partners who are dedicated to the same good purpose to which he is dedicated, namely, the health and well being of the people. Since the days of Hippocrates, a doctor has not been influenced solely by motive of profit. Though he knows that the practice of improving or preserving community health will reduce sickness and death, he does not consider public health work as being competitive with his own job of restoring and preserving individual health. Rather than being competitive, it is complementary.

PROGRESS

At the turn of the century, life expectancy at birth in the United States was only 49 years. A half century later, the average age at death is more than 67 years. The greatest strides have been made in bringing the infant past his first birthday. We have available greatly improved methods of protecting water, milk, and other food supplies and more effective methods of controlling communicable diseases.

We think of these advances as having occurred in the field of public health. But in my judgment, the impact of the private physician on public health progress is too often underestimated. I say this because in many areas in which organized public health services have been meager or nonexistent, considerable improvement in mortality rates also has occurred. There is evidence here that the family doctor has been practicing public health along with his curative medicine.

Read before the Section on Public Health, Texas Medical Association, Annual Session, Houston, April 28, 1953.

Regional Medical Director, Public Health Service, United States Department of Health, Education, and Welfare, Region II. Recently appointed to become State Health Officer of Texas.

As our population becomes older, it is logical to expect that the incidence of those diseases which are prevalent in the older age group will rise and cause relatively more deaths. This is precisely what has been taking place. The three leading causes of death in the United States in 1900 were tuberculosis, pneumonia, and diarrhea and enteritis.[3] In 1949 they were diseases of the heart, cancer, and vascular lesions affecting the central nervous system.[4] A shift in emphasis is taking place in our public health programs from the acute communicable diseases and sanitation to the chronic diseases.

Unfortunately, the chronic diseases as yet do not lend themselves easily to mass control. We need to think more in terms of the individual instead of principally about his environment. It is my belief, therefore, that the private physician will play a role of increasing importance in health conservation of the future.

ROLE OF FAMILY DOCTOR

The family doctor is the keystone of the arch in American medicine today. He is in a strategic position in large measure to exert the greatest single impact upon the health habits of the American family. How then, one might ask, may the family doctor discharge his responsibilities to society by engaging in good public health practice as well as good medical practice without special public health training? I should like briefly to discuss some answers to this question.

Vital Statistics.—The preparation of birth and death records is of paramount importance. It is irksome and somewhat of a chore to complete a death certificate, especially if it has to be done hurriedly because the mortician cannot obtain a burial permit without it. When the waiting room is full of patients, "senility" and "acute cardiac failure" seem easy to write down. But unless the underlying cause of death is recorded with accuracy, no amount of compilation or tabulation in Washington will reveal the true picture of mortality rates.

In recent years a birth certificate has become one of the necessities of life, and this fact serves as a constant reminder to those who otherwise might forget occasionally to file one.

Reporting of Diseases and Outbreaks.—In addition to reliable birth and death records, the prompt reporting of certain diseases is of great importance to the public health. Unfortunately, morbidity reporting in the past has left a great deal to be desired, and we might as well face it. Good medical records and prompt reporting of diseases to the health department go hand in hand whereas poor reporting usually results from an uncertain memory.

The implications of biologic warfare have alerted public health authorities to outbreaks of disease, especially if the outbreaks are unusual. Here again the private physician is the key figure. A single case may not require reporting while greater numbers of similar cases require prompt epidemiologic investigation and adequate control measures. Unless there is a health department handy in a sizable outbreak of this kind, the doctor and the community may face serious difficulty.

Advice.—The family doctor is the health adviser for the average American family. It is he who is called first for advice in the event of illness in the family. He learns to know the stresses and strains to which this unit of society is exposed, the emotional factors concerned, the economic aspects, and the environment in which its members live. This knowledge offers great advantages in the management of illness. It is usually his responsibility to make the decision as to whether or not a specialist is to be called, and it is he who counsels the family concerning serious and often grave procedures in the modern treatment of disease. These are some of the components of that priceless ingredient which we call the doctor-patient relationship, that ingredient which we believe has made American medicine the finest in the world and which must be preserved at all costs.

This position of confidence and respect which is enjoyed by the family doctor carries with it responsibilities not always recognized or discharged but of vital importance to community health. One of these is a move toward the correction of adverse environmental factors which have their impact not only upon the sick patient but upon the whole family. A word from the physician suggesting that the health officer is the specialist who needs to enter the picture might easily be the ounce of prevention which will keep the remainder of the family on its feet through the elimination of the hazard.

Another responsibility of the private physician is to maintain a high degree of immunity to the preventable diseases especially among his younger patients. It is refreshing to find an occasional family physician who runs through his records[2] to determine what proportion of his patients are immune to diphtheria or to smallpox. A word during a house or office visit or perhaps a card or telephone call from the doctor or his nurse calling attention to this deficiency should be considered an obligation to his patients and not construed as an attempt to solicit business.

I know of no surer method of bringing sex contacts in for examination than through the enlightened patient with syphilis or gonorrhea. In many instances, it is within the power of the doctor to eliminate the necessity of introducing a third party into the already

complicated picture by indoctrinating the patient with the importance of his own obligation in this connection, and a progress report from the patient on the results of his efforts to bring the source of his infection to treatment should not be overlooked at the time of his next visit.

PERIODIC APPRAISAL

Mention has been made of the lengthening span of life. The human "chassis" is being called upon to hold together longer and longer. Unfortunately, replacement of parts is seldom possible. Those who have had experience in the Air Force know about the 100-hour and the 1,000-hour airplane check-ups. All of us know that automobiles and all other mechanical contrivances require at least an annual examination for early signs of deterioration. What about the human machine? What about a 365-day check-up for human beings?

During the past decade almost every physician has been inordinately busy. He has found it difficult to spread himself sufficiently to meet the demands which were made upon his time. But for the most part, he has been busy with repair jobs—with plugging up the leaks, so to speak. He has not found the time to think in terms of appraisals of his patients in the absence of obvious illness. According to a report prepared by the American Academy of Pediatrics,[1] the pediatrician sees more well children than sick ones. This is not true in the case of the general practitioner, who sees more than twice as many sick patients as well ones.

From time to time, community-wide efforts have been made to screen the whole population or a portion of it to uncover cases of communicable or other diseases. We have seen mass testing for syphilis through serology, mass chest surveys for tuberculosis, and more recently the so-called multiphasic screening for chronic diseases. If it were generally practiced, the individual screen or check-up by the family physician on a recurring annual basis, preferably during the month in which the patient's birthday occurs, would, in my judgment, make the greatest single contribution to the early recognition of conditions which are rapidly rising toward the top of the list of the causes of death or disability.

The procedures to be done at various ages could be worked out by national professional groups to provide reasonable uniformity. Obviously, a balance would have to be struck between too much and too little. Concise record systems would make possible quick comparisons with previous examinations.

This type of preventive medicine by the private physician has dynamic possibilities. I should like to suggest that the interest on the part of the average patient to such repeated appraisals of his health status in the absence of obvious disease is far greater than is generally known. It is discouraging for him after little or no examination to be told by his family doctor, "There's nothing wrong with you. Stop worrying and come back when you're sick."

While many routine aspects of the procedures to be followed might reasonably be carried out by ancillary nonmedical personnel, the health check-up should not be so highly mechanized as to leave out its most valuable ingredient for the patient, namely, the medical judgment of the family physician. And in reply to those who contend that the doctor's place is at the patient's bedside, it is submitted that in the early detection of almost any clinical entity lie the richest rewards for the conservation of the patient's health.

SUMMARY

It has been suggested that modern society requires the inclusion of health in community planning. A few basic concepts generally accepted by public health specialists have been enumerated. The strategic importance of the private physician in connection with the changing emphasis of public health programs has been discussed, including his responsibilities to the public health in his day-to-day practice. The opportunities of the family doctor to make a major contribution to the public health through a carefully organized plan of periodic health appraisals of his patients has been discussed briefly.

ABSTRACT OF DISCUSSION

DR. WILLIAM R. ROSS, Tyler: Dr. Holle has stressed the need for close cooperation between the public health specialist and the private practitioner. I would like to emphasize this point because I feel that it often means the difference between a successful program and a program that is difficult to administer. We should always keep in mind that the private practitioner generally considers his relationship to the patient as one of utmost importance and, therefore, the doctor's attitude may be influenced by the patient. The private practitioner may fail to report a disease since the disease may be considered by the family to be a family stigma; he may feel that the investigation conducted by the health department will interfere with the conduct of his practice; or he may simply feel that public health is an inroad toward socialized medicine.

When the health officer fully realizes the problems he is facing, he may decide better upon the tact and approach to use in overcoming the misunderstanding.

PUBLIC HEALTH AND PHYSICIAN—*Holle—continued*

Dr. Holle has pointed out that public health is a specialty which requires special training comparable with other specialties. I often think how much easier the health officer's job would be if he were in a position to employ well qualified and trained personnel. Often the difficulty with a private practitioner results from the fact that the practitioner has experienced a feeling of interference in his practice on the part of an inexperienced or overenthusiastic public health worker. To fulfill this dream for more qualified personnel, we must have a reservoir of qualified applicants from which to make our selections as well as sufficient funds to enable us to compete for the best.

Dr. Holle has touched upon the fact that both the health officer and the family doctor have responsibilities of vital importance to community health. This responsibility could be better accomplished in all cases if the physician simply would suggest to the family that those in the health department are specialists in the field of preventive medicine and, as such, are needed as consultants to eliminate fully hazards that may exist. When such suggestions are made, the public has much better respect for the practitioner as well as the health department representatives.

In closing, I would like to restate a basic concept of which we must never lose sight and that is that health surveys of any type should not be so highly mechanized as to leave out the most valuable ingredient for the patient, namely, the medical judgment of the family physician.

Alcoholism — A Public Health Problem

GEORGE A. CONSTANT, M. D., Victoria, Texas

ALCOHOLISM, along with cancer, tuberculosis, and heart disease, is ranked as one of the four major health problems facing us today.

The Metropolitan Life Insurance Company in a recent publication states that there are 50 per cent more sufferers from alcoholism than from tuberculosis; that 65,000,000 people drink alcoholic beverages in varied forms and amounts; and that 4,000,000 people in the United States are either actual or potential alcoholics. The exact number of alcoholics in Texas is not known. However, we do know that alcoholism is prevalent and that the difficulty is spreading.

The ravages of alcoholism are not confined to its actual victims. Members of their families suffer emotional, mental, physical, and economic hardships. In fact, it is probably safe to state that there is hardly a family which has not, at some time or another, been directly concerned with the problem of excessive drinking.

In 1947 *The Journal of the American Medical Association* reported on the findings of a special committee which investigated medical and health conditions in Alaska. Its findings regarding the problem of alcoholism are enlightening: "Alcoholism has assumed the proportion of an important problem in Alaska. In discussing the general over-all health problems of the territory with physicians, truckers, military authorities, and the man on the street, the subject of alcoholism was always spontaneously referred to by them. It accounted for a great deal of human suffering to both victims and their dependents. Indigence, venereal diseases, poor housing, poor nutrition, and general poor health can be attributed directly or indirectly to alcohol."

Read before the Section on Public Health, Texas Medical Association, Annual Session, Houston, April 29, 1953.

In addition, think of the divorces which come as the result of alcoholism, directly or indirectly. Alcoholism has a much wider spectrum than one would ordinarily suspect. It is not only a problem itself but also the source of many, many other difficulties, such as broken homes, mental anguish, and even diseases such as tuberculosis, syphilis, gonorrhea, brain damage (Korsakoff's syndrome), malnutrition, and general poor health.

Another secondary effect which should not go unmentioned is the tremendous number of lost manhours in industry due to alcoholism. Since Texas is now enjoying the most rapid and extensive expansion in industry of any part of the country, the problem of the excessive drinker in our state is assuming even more importance than ever before. Major industries now recognize that alcoholism accounts for approximately 19 per cent of absenteeism. Alcoholism is now depriving industry of the services of skillful and valuable employees in all categories from the common laborer to even the highest echelons.

Another secondary effect has to do with traffic accidents. Homer Garrison, Jr., director of the Texas Department of Public Safety, recently furnished the special Committee on Study of Alcoholism of the Texas Medical Association with data showing that more than 80 per cent of all persons whose licenses were suspended in Texas in 1949 lost them because of driving while intoxicated (DWI) charges. There was a total of 12,726 suspensions of licenses of which 10,255 were on DWI charges. Mr. Garrison also revealed that 838 of the Texas drivers convicted on DWI charges were suspended for a second time or more times for the same offense. His statistics showed that in rural traffic accidents a drinking driver was involved in 42 per cent of all fatal accidents and 21

per cent of the nonfatal accidents. He also showed that 32 per cent of all pedestrians killed had been drinking and 18 per cent of those injured had been drinking.

Dr. William Willentz, medical examiner for Middlesex County, New Jersey, in a recent publication reviewed the problem of alcoholism in violent deaths over a period of nineteen years. He found that alcohol was a contributing or responsible factor in 37 per cent of 1,258 violent deaths investigated.

At this point it might be interesting to conjecture what percentage of those now being booked as driving while intoxicated should be classified instead as driving while drugged, for the use of barbiturates and narcotics with and without alcohol is growing at an alarming rate. This is a problem in itself, but one not far removed from alcoholism. Historians no doubt will label this particular era as "The Age of Sedation" because of the widespread use of sedatives.

DEFINITION

Alcoholism has been discussed as a menace to public health and general welfare, yet nothing has been said about the definition of alcoholism. What then is alcoholism and who is the alcoholic?

Let us first consider all of the wrong definitions of an alcoholic. Everyone has heard the expression, "An alcoholic is an individual who drinks alone." Many a father and mother have given advice to their offspring sounding like this: "Son, never drink alone, and you will never be an alcoholic." Also, many well meaning doctors, psychiatrists, and clergymen have given the same advice. However, the fact is that there are many, many alcoholics who never drink alone. As soon as they start drinking they become gregarious and develop "telephonitis." They do not want to be alone—they want to be with others.

There is another axiom: "The alcoholic is the person who has to take a drink in the morning." Then, as a corollary, this advice is given: "If you don't drink in the morning, you are not an alcoholic." There are many alcoholics laboring under this misinformation. Think of those who refuse to consider themselves alcoholics because they fight off the jitters all morning with aspirins, BC's, and Bromo-seltzers, until at 12 noon they resume their drinking.

Another common misconception about alcoholism is the old idea that by staying within two or three drinks no one becomes an alcoholic. The trouble with this moralizing is that despite everything, an alcoholic cannot possibly stay within such a limit. The truth is that for an alcoholic, "One drink is too many and a thousand are not enough."

Perhaps the most classic advice given by well meaning doctors, parents, clergymen, and educators is "Stick with beer—the light stuff—and you'll never be an alcoholic." Anyone dealing with alcoholics knows the fallacies in this statement. There are many alcoholics who drink nothing but the so-called light stuff such as beer and, more particularly, wine.

Another common error regarding alcoholism is the recommendation, "Never drink every day and you'll not be an alcoholic." We all are familiar with the "periodic binge" type of drinker who may go for weeks, months, and even years without touching a drop and then go on a real spree. It makes no difference whether an alcoholic is a periodic drunkard or a drunkard period.

What then is alcoholism and who is the alcoholic? Alcoholism is a symptom—yes, a symptom of an underlying illness. An alcoholic is an over-the-line drinker whose drinking definitely interferes with his everyday living. He is one who, having taken one drink, cannot guarantee his behavior. He is a person who, after taking the first drink, cannot tell when he is going to stop.

CAUSE

What is the cause of alcoholism? Much has been learned during the past few years regarding the cause or rather causes of alcoholism. First, one must consider that there are many contributory factors which are not in reality the etiologic agents but merely circumstances which aggravate the underlying cause. For example, pain, environment, illness, economic problems, and marital difficulties all are listed as causes. Actually they are not causes but occasions. All of us have heard the remark: "Well, I can't blame So-and-So for getting drunk. If I had to put up with his wife, I'd be drunk all of the time, too." What is not realized in such an instance is that the wife is not the cause of the man's drinking (although many times she might be the exciting factor) and even if she were removed from the man's life, he still would continue to get drunk if he were an alcoholic.

Despite the tremendous amount of research and study of the problem of alcoholism, the primary cause, if there is one, is unknown. Instead it is thought that there is no single cause, but a combination of factors that creates an excessive drinker.

Dr. Edward Strecker, chairman of the Department of Psychiatry, University of Pennsylvania Medical School, defines the cause of alcoholism as "momism mixed with alcohol." He means that the average alcoholic was either much pampered or much neglected and rejected by his mother when he was a child. In the case of the pampered child, the person grows to adult life but tends to retreat because the demands and responsibilities of everyday living are too much for him. Most of us tend to want to retreat, but in the case of the alcoholic it is pathologic and obvious.

Because of his stunted emotional growth and therefore inability to cope with everyday problems, he develops pathologic insecurity and fear. If this is mixed with the highball or cocktail, the element of fear is released and dominates the personality. This is also true in the case of the neglected or rejected child. The common denominator, then, is pathologic fear. It is this aspect which becomes so trying and is least understood by those closest to the alcoholic.

The alcoholic's fears are of the commonplace and trivial rather than of the big things which we erroneously consider as the mark of the brave. He fears social errors; he fears the dark; he fears breaches of etiquette. For example, when an alcoholic is drinking, he is afraid of the dark and as night falls his fear increases. At the same time should an emergency such as the Texas City disaster arise, he will be the first to offer his services (if he is able). In fact, there have been many alcoholics decorated for acts of bravery beyond the call of duty.

This fear is responsible for the four basic traits found in alcoholics: sensitivity, childishness, egocentricity, and grandiosity. These are usually operative in the subconscious. However, they may be expressed or manifested consciously by such symptoms as irritability, loneliness, depression, resentments, defiance, pouting, elation, obstinance, aggressiveness, determination, dishonesty, nervousness, restlessness, frustration, and selfishness.

Because all of these attributes of an alcoholic's personality are based on the element of abnormal or pathologic fear, this element of fear must not be increased. Instead, fear must be offset or counterbalanced by faith, hope, and self-confidence. It is also the reason why condemning, criticizing, making fun of, or frightening an alcoholic only accentuates his difficulty. A so-called normal person who pouts does so because he is hurt—an alcoholic does so because he is frightened.

In the light of these findings it is no wonder that physicians, psychiatrists, and the clergy have had such poor success in solving the problem of alcoholism in the past. The physician, if he attempts to treat an alcoholic, usually does so by telling him that if he does not quit drinking he will die of heart trouble or some other disorder. What does this do? It generates even more fear; thus the patient, emotionally speaking, is right back where he started. Then consider what the psychiatrist usually says to such a patient: "If you don't stop drinking, you'll wind up in an insane asylum." That is exactly what the patient is afraid of, and if his fears are further confirmed and extended by a so-called expert, the vicious cycle begins again. Perhaps he has made a visit or two to the asylum, and to make insanity more bearable, he reaches for another fifth.

In all these cases the condition that was causing the excessive drinking becomes accentuated. The condition becomes worse, and the alcoholic becomes more fearful than ever. Therefore, he drinks more.

There are, of course, other causes for excessive drinking. Alcoholism has been thought of as an allergic disease or as a condition of hypersensitivity. Recent studies have focused attention on hormonal imbalance—particularly with respect to the anterior pituitary–adrenocortical carbohydrate system.

TREATMENT

Prevention.—Alcoholism cannot be prevented or controlled by legal punitive measures, no more than can tuberculosis, syphilis, or poliomyelitis. Its prevention lies in stimulation and providing a more healthy childhood—a childhood wherein a person is fully accepted and shown approval and affection. This calls for a more closely knit family life. This means more education of the public in an attempt to pass on a more profound comprehension of the difficulty.

Chemotherapy and Psychotherapy.—Active treatment of the problem drinker may be divided into two parts. The first phase has to do with the immediate effort to obtain the patient's sobriety. The second phase is concerned with treating his personality so as to help him maintain his sobriety.

For sobering up purposes, hospitalization is always desirable. All alcoholic beverages should be withdrawn immediately or at least within twenty-four hours. Ten cc. of aqueous adrenal cortical extract (ACE) should be administered intravenously every six to eight hours for twenty-four hours; then every twelve hours for the next twenty-four to forty-eight hours; then once a day for two or three days; then 5 cc. intramuscularly biweekly for four weeks; then 5 cc. intramuscularly weekly for four weeks or longer.

Adrenocorticotrophic hormone (ACTH) also may be utilized, and it effects dramatic results especially in delirium tremens. The dosage is 25 mg. intramuscularly every four to six hours for twenty-four to forty-eight hours. Of course, the usual precautions are taken regarding the administration of ACTH. The body weight and blood pressure must be measured at frequent intervals to guard against any disturbance in the electrolyte and water balance.

Fluids in the order of 1,000 cc. of 5 per cent glucose in saline solution containing 20 cc. of ACE may be given intravenously to severely dehydrated or anorexic patients once or twice daily for one to three days.

A low carbohydrate, high fat, and high protein

diet cannot be overlooked. Caffeine and sweet carbonated beverages should be omitted.

Benadryl solution may be administered in dosages ranging between 2 and 5 cc. intravenously along with ACE every twelve to twenty-four hours for marked excitability and distressing nervous or gastrointestinal symptoms.

Tolserol in 1 to 2 Gm. doses four times daily is helpful in reducing muscular tension.

Vitamins should be administered both orally and parenterally.

Sedatives, barbiturates, and narcotics should be used judiciously and sparingly. They should not be allowed to serve as a substitute for alcohol.

Antabuse is tetraethylthiuram disulfide, which when combined with alcohol yields acetylacetic acid, a highly toxic substance which may cause death. It must not be given until after the patient has been alcohol-free for seven days. Its dangers must be explained carefully to the patient, and he must have a full and commanding knowledge of the drug before taking it. It should be administered only as a crutch to help him maintain his sobriety until he is on solid emotional footing once more.

The second phase of treatment is largely psychologic, and it involves not only the patient but his family and friends. They must be told the true nature of the difficulty and then must be made to realize that it can be arrested—that there is hope. In this connection there is referral to Alcoholics Anonymous, which is the answer for most alcoholics. This program has a threefold approach to the problem. Alcoholism is considered a physical, mental, and spiritual sickness, and it is maintained that unless there is an adjustment of the personality on all three levels, there will be no permanent sobriety.

The Alcoholics Anonymous program revives the alcoholic's confidence in himself because he is approached by another alcoholic. The axiom that it takes an alcoholic to treat an alcoholic possesses a great deal of merit. Members of Alcoholics Anonymous insist that the ability to establish this contact of confidence is a gift of the Almighty to all recovered alcoholics. Fear is replaced here with faith and confidence. They have a deep conviction, "Once an alcoholic, always an alcoholic." This points up the fact that, at the present, alcoholism may be arrested but cannot be cured. They place their ultimate security and sobriety upon the only true source of security —Almighty God. Finally they use the time-valued plan of group therapy. This affords the alcoholic an opportunity to work through many of his personality defects.

The core of the Alcoholics Anonymous program consists of twelve steps, simple and solid; its meat is the practicing of the conviction that only an alcoholic can fully understand another alcoholic.

It is something like the story of the boy at the puppy sale who hesitatingly edged up to the seller and said, "Please, mister, I'd like to buy a puppy. How much do they cost?"

"They're $10."

The child's face fell. "I've only got $1.63. I heard you had one with a bad leg. How much is he?"

"But that one will never walk perfectly. You wouldn't want him."

Hiking up his pants leg, the little boy showed a brace. "I don't walk so good either, mister, and I reckon that's just the puppy I want. He'll need some understanding for a long time, till he gets used to it. I did."

Today many more than 100,000 men and women have sobriety because someone understood their problem.

COMMUNITY ASPECT

The skid rows of America are nothing but a black memorial to the mishandling of the problem drinker.

It ill behooves any community to have great and expensive edifices built for the protection of the public's health and then allow the squalor of skid row to mar the community. It does not take elaborate buildings and great expenditure of money to improve this problem. The instruments for this operation are the things that money cannot pay for. It takes the basic kindness that one human should have for another. It takes tolerance and sympathy and understanding and an enlightened approach.

ABSTRACT OF DISCUSSION

DR. ANDREW S. TOMB, Victoria: Of course we are thankful for the advances made in the use of hormones. We are appreciative of a more generally enlightened attitude concerning this disease. By far the greatest improvement in therapy in our generation, however, is that we can now tell the alcoholic patient with certainty that he is a sick man instead of just a "never-do-well." The quicker we forget the misnomer "will power" in controlling drinking the better off we will be. This man is a victim of compulsion and will power has nothing to do with it. Many alcoholics

have used more sheer nerve and will power in getting up off a sick bed to find another drink than others have used in establishing a business empire.

In spite of all of the education and all of the cooperation of the press and radio, we still have thousands of problem drinkers who do not understand their plight, and they do not know that there is a way out of their dilemma.

Dr. Constant's paper sounds a definite note of optimism which is refreshing to find in the average psychiatrist's approach. It is time to forget the negativistic approach toward the problem drinker. In many instances the public health physicians are our front line of education and they should remember this note of optimism in their thinking of this disease.

All public health physicians have recognized the classic story of Typhoid Mary in the spread of disease. Alcoholism likewise is the carrier of many and other public health problems whether it be directly or contributory. Since education is the first step in improvement it likewise follows that education must begin with the physician.

PREVENTIVE PSYCHIATRY IN PUBLIC HEALTH

WILLIAM M. SHANAHAN, M. D., Galveston, Texas*

THE public health expert has chalked up so many successes in areas of human suffering that there is much reason to hope that in time he will change the unfortunate fact that psychiatric disorder is now our country's number one public health problem. A psychiatrist can tell something about the nature and extent of the problem and about administrative measures and programs now in the field, but he is less sanguine concerning an operating program which with certainty would mitigate the problem. He often is not even sure as to where prevention stops and clinical psychiatry begins. In some states intensive treatment is being given with the idea of preventing chronic institutionalization. The psychiatrist has been so busy treating the sick that he has had little time or energy for studying the larger aspects of the situation. He is certainly in need of the interest, techniques, and collaborative efforts of those in not only public health but also government, education, religion, sociology, and several other fields.

Although the exact nature and extent of psychiatric disorder in our society is not known, there is enough information to indicate that no other public health problem is of greater magnitude. In the main, psychiatric disorder can be equated with emotional disorder although it must include certain organic conditions such as general paresis, cerebral arteriosclerosis, senile deterioration, convulsive disorder, and some fraction of mental deficiency. Emotional disorder manifests itself in a considerable variety of social morbidity such as delinquency, vagrancy, crime, divorce, dependency, illegitimacy, prostitution, suicide, alcoholism, and drug addiction. At present 1,750,000 serious crimes are committed each year in the United States; at least 50,000 people are addicted to narcotics; there are 3,800,000 problem drinkers of whom 950,000 are severe, chronic alcoholics; 17,000 persons commit suicide each year; 265,000 children are brought into the juvenile courts yearly; and for every 4 marriages there is 1 divorce.[4] Emotional disorder also contributes to physical illnesses which bring patients to physicians in all branches of medicine to the degree that it is estimated that 30 per cent of all patients in general hospitals and 50 per cent of all patients of general practitioners are suffering from personality disturbances or physical illnesses associated with personality disturbance.[4] In assessing the problem, one must also include many persons with psychosomatic disorders such as asthma, peptic ulcer, hypertension, colitis, migraine, and atrophic arthritis. A recent study indicates that 78.5 per cent of 200 routine admissions to a dermatology clinic were for psychosomatic reasons.[3]

In addition, there are 1,500,000 people in our country who are suffering from serious mental illness; of these, 650,000 are in hospital beds, constituting 47 per cent of all the patients in all hospitals in the United States. Each year more than 250,000 new patients are admitted to mental hospitals and another 100,000 are readmitted. One out of every 12 children born each year will sometime during his life suffer a mental illness severe enough to require hospital care.[4] A recent survey by Roth and Luton showed that for 1,000 persons in a community, 123 were to some degree in need of help for emotional disorder.[5] Of this 123, only 2 were hospitalized, indicating that for every patient who gets into a hospital there are at least 60 others who need help.

As I remember, the public health expert judges water by the number of Bacillus coli in it. Although there is no such handy device in psychiatry, there is the survey. A recent one secured interesting figures concerning sex education from parents in those who later became students of nursing and medicine. Of 55 affiliate nursing students from four different

Read before the Section on Public Health, Texas Medical Association, Annual Session, Houston, April 28, 1953.

**Now Associate Clinical Professor of Psychiatry, University of Colorado Medical School, Denver.*

schools in Texas, only 3 had received any type of sexual education from their parents during their years of growth. Of 160 freshmen medical students from all parts of the state, 25 had received any education in sexual matters from their parents.[6] One would not have to be a psychiatrist to suspect from this that the great majority of our youngsters are growing up in families where the capabilities or attitudes of the parents leave much to be desired. If we are to have healthier population, we somehow must grow healthier people who in due time will be better parents than their own.

PRESENT CARE

The great bulk of present psychiatric activities is concerned with the care of people who are already ill. It is likely that a fraction of chronicity is due to the inadequate care which is almost universal. At present no public mental hospital in the nation meets the minimum standards for personnel of the American Psychiatric Association. In 1950, there were 1,228 service locations throughout the United States where psychiatric clinic service was available. Three-fourths of these clinics were operated by public agencies. At present about $4.15 per year is available for research per hospital psychiatric patient as compared with $28.20 for infantile paralysis, $26.80 for tuberculosis, and $27.70 for cancer. For several years the federal government has included about $10,000,000 per year for the work of the National Institute of Mental Health, including research, training grants, and development of new clinical facilities. With these funds many states have organized bureaus of mental health in their health departments. In general, these bureaus have subsidized clinics for adults and children and have sponsored educational activities through courses, movies, and literature. Some states have matched the federal funds, and some have not. Undoubtedly, this federal program has been useful in developing new facilities, securing more trained workers, bringing clinical service to many, and acquainting many others with facts. States like New York and California have extensive service programs which include traveling teams which through demonstration bring case finding, superficial therapy, and education into many communities which have no other facilities. Hawaii has a program by which branch offices, with a resident psychiatric social worker, conduct educational, consultation, and case finding work. In some states, mental hospitals are actively conducting community programs in the area from which they receive patients.

It should be noted, however, that almost all of what is being done is concerned with individual service which is needed after the fact of emotional disorder has been established. The concept of applying public health measures in this field is so new that the schools of public health in the United States maintaining a division of mental hygiene can be counted on one hand.

EXPERIMENTS

Because of the realization that the basic vulnerability to mental disorder is acquired in childhood, some experiments aimed at influencing the emotional development of the students in a healthy manner are going on in the schools. In some ways the demands and complexities of modern life seem to exceed the capacities of many families to bring forth emotionally healthy persons unaided. Since every child goes to school for a number of years, the experiment in positively influencing emotional development during this time would seem to be wise. One of these enterprises, originated by Col. H. Edmund Bullis of Delaware, has been in operation for a number of years and is now so refined and impressive as to be in use in classrooms totaling more than 200,000 students in different states all over the country.[2] The materials are in a form which makes them usable by any teached who will follow the directions and devote one hour per week to them.

There are other experiments which go much further. In a suburb of Toronto, the entire operation of the schools is organized around mental health principles with the idea that when some final satisfactory techniques and practices are developed, they then can be applied throughout a large area.[2] Some efforts are being made here and there at providing professional students in education, religion, nursing, law, and other fields with a knowledge of human development, functioning, and needs.

Although the advent of psychodynamic psychiatry markedly complicates the task of studying and understanding the emotional development and functioning of a person, it for the first time makes it possible to deal with human problems etiologically. From the intensive study of individual failures of adjustment, we have learned about numerous important normal developmental needs and problems, and also we have learned methods of management which will lead to healthy growth. We also know about common methods of mismanagement which contribute to the vulnerability in the structure of the adult which renders him incapable of handling life situations successfully. For instance, we know that emotional damage can be done to children by allowing them to sleep in the parents' bedroom until an advanced age, that circumcision in boys between 3 and 7 years old is so emotionally hazardous it should be avoided if at all possible, and that permitting outlets for hos-

tility is far better than total suppression. Sickness, surgery, marriage, separation, discord, an absent parent, death, moving, and other family occurrences carry with them real emotional impact on children. Unless these internal situations are understood, they are not apt to be managed constructively.

Some new terms are appearing in the medical literature. These include "psychosomatic medicine," "social medicine," "total medicine," "environmental medicine," "integrated teaching," and "vertical curriculum." A number of experiments are being conducted in the organization of the medical curriculum.[1] One goal of these experiments is to prepare better all medical graduates to understand the environmental, social, family, interpersonal, and emotional aspects of medical practice. The physician can be a key person in demonstrating and teaching methods contributing to healthy growth.

PROGRAM

The physician may wonder what program can best serve mental health needs and what role the public health worker can fill. This paper lacks material concerning an integrated administrative organization of activity in lay and professional education, prevention, case finding, research, and clinical services in psychiatry. Unfortunately, the difficulty is not with me but with the fact that half a dozen different state supported activities operate independently in the field with no over-all planning or coordination. A concerted effort upon this huge problem should start with a coordinated program including the public health and psychiatric departments of the state medical schools; the Bureaus of Maternal and Infant Health, Public Health Nursing, and Mental Hygiene of the State Health Department; the Department of Public Welfare; the State Youth Development Council; the juvenile courts; and the educators of the state on the elementary, secondary, and college levels. Such an approach would make a comprehensive program possible.

The public health instructor at the medical school should be one of the most important members of this operation, not only in educating qualified personnel and in introducing preventive psychiatry to students of medicine and nursing but also in initiating and conducting basic research into the epidemiology of emotional disorder. This is a matter about which little is known. At long last it has been learned that psychiatric disturbances are not inherited just as it was learned some seventy years ago that although tuberculosis runs in families, it is not inherited, but the healthy child is infected by the sick parent. It may be that epidemiologic research would identify some of the geographic, social, cultural, occupational, educational, religious, family, age, and sex factors which would help single out particularly vulnerable situations and individuals. It is hoped that the public health researcher will be able to provide the techniques necessary in devising and evaluating the results of experiments growing out of research surveys.

The department of psychiatry of the schools of medicine should offer the state an outstanding example of the best present day knowledge and practice in the field and should be continually experimenting with various methods of education, community service, and therapy. It also should assume responsibility for providing the mental health agencies and the communities of the state with an adequate number of properly trained persons in the field. It could well supply many of the workers necessary for the research, demonstration, and service programs in several of the other state agencies and simultaneously better prepare its students for a type of practice far above a concern only for the 1 person in 60 ill who gets into the hospital and for the 1 in 10 in the total population who is obviously in need of medical help. Important as the treatment of the sick is, any improvement in the total public health problem of psychiatric illness will come not from the treatment of individual patients but from preventive work with the whole population. It is the proper concern of the medical schools to be training psychiatrists and physicians who are able to fit into such a program.

The State Health Department has numerous opportunities to do research, educate, and prevent disorder through its well baby clinics, its contacts with the newly married or those about to marry, its widespread associations through public health nurses and its Bureau of Mental Hygiene.

There are many opportunities for the state hospitals to improve internal operations and to become area leaders through the development of research, outpatient follow-up, and educational activities. Some states have found it wise to provide university level psychopathic hospitals in different areas of the state for all those who need psychiatric hospital care. With good modern practices these hospitals can return as many as 75 per cent of the patients to the community. A great deal of money thus can be saved by preventing admissions which cost the taxpayer $6,000 per average case.

It is well known that many individual families that come to the attention of any welfare agency are far more in need of clinical service than of money. The same can be said of the young people who find themselves in juvenile courts and state reformatories.

One of the major opportunities in our society to bring healthy factors into the development of children is in the schools, not only through the general

organization and facilities but also through the teacher-student relationship and through the occasion the school has to know about disturbed families and to participate in bringing them help. An over-all preventive psychiatric program certainly would include many experiments in the selection and preparation of teachers, in administrative and curriculum practice, and especially in activities aimed at identifying the areas of emotional difficulty in students and helping them with their problems.

Although outside the field of medicine, every advance in the general standard of living, in the provision of active recreational programs for all, in race relations, in adult education, in improved housing, and in greater leisure can contribute much in preventive mental hygiene.

Democracy ideally operates on a local level. The possibilities of putting the best preventive measures we know and the research which should be done into operation must depend somewhat upon individual communities. State and national agencies can offer suggestions, give advice, conduct demonstrations, and assist in area-wide bookkeeping procedures by which the effectiveness of preventive activities in a given community can be measured.

In conclusion, it is my hope that the interest in preventive psychiatry will persist and expand and that eventually, by working together, we can diminish emotional disorder and add to the usefulness, utility, and joy of life for all.

ABSTRACT OF DISCUSSION

DR. HARRY M. LITTLE, Houston: The main burden of devising and carrying on a program of promoting mental health and of preventing mental illness must fall on public health workers. More than any other single professional group their training and experience qualifies them for this task. They have the skills in epidemiologic research, in coordinating the efforts of workers in various professional fields, and in organizing at national, state, and community levels the joint efforts of lay and professional persons and groups to solve a common problem.

The field of competence of psychiatrists as a group is chiefly limited to the diagnosis and treatment of persons who have already developed some form of emotional disorder and to research into its nature and causation.

The question arises as to just what is meant by preventive psychiatry. I recall hearing Dr. Stevenson of the United States Public Health Service make the distinction between the fields of mental hygiene and psychiatry. He stated that the former had to do with promoting mental health and preventing the development of mental disorder and at the point that mental disorder develops, the case ceases to be a mental hygiene problem and becomes a psychiatric problem.

In this sense, relatively few psychiatrists are doing preventive work. Even those who work in child guidance clinics and who undertake a certain amount of lay education and other activities that could be considered preventive, nevertheless see their main function as the diagnosis and treatment of children with behavior and emotional problems.

On the other hand, if we take a broader definition of preventive psychiatry—including in the definition basic research in cause and treatment, the accumulation of knowledge about personality structure and development and the positive and negative factors that influence this development, the early diagnosis and proper treatment of children and adults with behavior and emotional problems to avoid the development of more serious disorders—then we may say that a considerable amount of preventive psychiatry is done in this country.

But the combined efforts of psychiatrists and public health specialists will not be equal to the tremendous task of preventing and controlling mental illness. I cannot stress too forcefully the point Dr. Shanahan has made in this connection. There also is needed collaboration of psychologists, sociologists, cultural anthropologists, and all other professions and groups in the community engaged in teaching, counseling, and otherwise seeking to help people solve their own problems. Neither must we overlook the importance of lay participation and support in this program, which, to be successful, must reach into all phases and aspects of family and community life.

Dr. Shanahan has spoken of the necessity for more epidemiologic studies and has referred to several community surveys that have been made. It is heartening to know that at present there are major interdisciplinary projects under way in Onondaga County, N. Y.; New York City; Nova Scotia; and New Haven, Conn. I understand that in the proceedings of the 1952 Round Table on Mental Health of the Milbank Memorial Fund's twenty-ninth annual conference, there will appear brief descriptions of nine such research projects now being carried on.

As an example of significant findings coming out of epidemiologic research are the facts resulting from a project conducted by Community Research Associates in St. Paul, Minn. For instance, in a group of 5,211 families there were found 79.4 per cent of the reported cases of psychiatrically diagnosed emotional disorders (other than those reported only by the state hospitals), 69.2 per cent of reported mental deficiency, and 52.9 per cent of officially reported antisocial behavior.

These figures not only point out the influence of family living on personality development but also strongly suggest that community-wide knowledge and preventive plans should be set in a family framework.

The last point in Dr. Shanahan's paper upon which I will comment is his statement to the effect that in the last analysis the success of a program of prevention and control

PREVENTIVE PSYCHIATRY—*Shanahan—continued*

of mental disorder must depend upon the local community. To my mind, this is the only way these programs really can be made to work. Just as the individual patient must have the desire for help and a willingness to invest energy and perhaps money in an effort to solve his own problems if he is to be helped by the psychiatrist, so it is with the local community that is faced with the problem of mental disorder. The interest and active participation of a sizable segment of the lay and professional people in the community must be obtained if a preventive program is to be effective and if state and national agencies in the field of mental health are to be helpful.

PSITTACOSIS (ORNITHOSIS)

Infection by Fleeting Contact with a Parakeet

ELMER E. COOPER, M. D., San Antonio, Texas

IT IS not necessary to have prolonged or intimate contact with birds to become infected with the psittacine (ornithosis) virus. As will be presented in this case, "fleeting" exposure may be sufficient. Recognition of this will lead to greater diagnostic accuracy in many cases of primary atypical pneumonia. If a history of even transient exposure is obtained, one should be alerted to perform complement-fixation studies for ornithosis. Smadel, in 1943, discovered positive complement-fixation tests in 10 of 45 cases of primary atypical pneumonia, and 4 had definite history of pigeon contact.

ETIOLOGY

The etiologic agent in ornithosis is the Miyagawanella psittaci virus, which is intermediate in size between Rickettsiae and true viruses. By staining with basic dyes, one can visualize, under ordinary microscopic magnification, the elementary coccoid inclusion bodies in reticuloendothelial cells of infected tissues—the Macchiavello bodies. The virus is a relatively hardy one, but may be inactivated by .1 per cent formalin and .5 per cent phenol in twenty-four hours.

SOURCES OF INFECTION

There has been a steadily increasing number of bird reservoirs recognized as sources of human ornithosis infection. Since 1945, more than 500 human cases of this disease have been discovered in the United States and Canada. In this series, the psittacine group of birds (parrots, parakeets, cockatoos, and budgerigars) has been responsible for less than one-third of the cases. Canaries, finches, fulmars, doves, pigeons, Pekin ducks,[12] turkeys,[3], pheasants,[11] and chickens,[7] have now been recognized as potential sources of exposure to the infection.

The virus is present in droppings, in nasal discharges, and in the saliva of the birds. Infection is contracted usually by inhalation and rarely from bites, and the bird need not be sick or dead to infect.[1]

A serious source of infection is the "human to human" spread. This may occur by transmission from the patient to members of the immediate family, to transient visitors, or to attendants or, rarely, from carrier sources. There have been 23 reported instances of "human to human" spread involving 30 nurses. In these cases, contact with birds was definitely excluded.[8, 12] Eaton, Beck, and Pearson reported a fatal case in which the patient infected 3 nurses, of whom 2 died. Two laboratory workers assigned to this case also developed ornithosis, but recovered. Apparently, massive elimination of the infectious agent occurs during the acute illness, and, therefore, most "human to human" contacts occur among hospital and laboratory workers.

Gerlach found the virus of ornithosis in the sputum of 5 patients without clinical evidence of disease,[12] thus suggesting the potentials of a human carrier state. Meyer and Eddy[9] isolated the virus of ornithosis from respiratory discharges of a patient eight years after a severe acute attack. Since the wife of this carrier neither contracted the disease nor developed positive complement-fixation titers, it may be concluded that there must be a low rate of contagiousness in a carrier.

PATHOLOGY

The principal pathologic findings are in the lungs and spleen. Bronchopneumonia starts at the hilus and extends to the periphery. The cells in the alveolar exudate are largely monocytes showing phagocytosis with intracytoplasmic inclusion bodies. The spleen is invariably enlarged, with engorged sinuses filled with phagocytic cells, and the smaller vessels show hyalin degeneration.[4]

CLINICAL FEATURES

In man, the incubation period of ornithosis is seven to fourteen days, rarely thirty. Initially, there is an influenza-like picture, typical symptoms being fever, severe frontal headache, photophobia, and

chilly sensations with profuse sweating. At the onset, the temperature is 100 F. to 102 F. gradually rising to 104 F. Early, there is a dry harsh cough with scanty mucoid sputum, later becoming productive. There is a relative bradycardia, a normal leukocyte and differential count, and on rare occasions, a rose spot skin rash simulating typhoid fever.

The course may last three to four weeks, with defervescence by lysis. Relapses are characteristic, and convalescence is frequently prolonged for several months. Death is usually due to pulmonary insufficiency, secondary to massive pneumonia. Roentgenograms reveal patchy pneumonitis, starting near the hilus and extending peripherally. Serial films show slow resolution. As the hilar involvement of the lung occurs first, the peripheral signs occur later, and the roentgenogram is frequently positive before the auscultatory changes and usually shows a greater degree of pathologic involvement than is anticipated.

The physical findings are primarily those involving the lung and spleen. The spleen becomes characteristically enlarged from the tenth to the eighteenth day of the disease, and may be missed unless

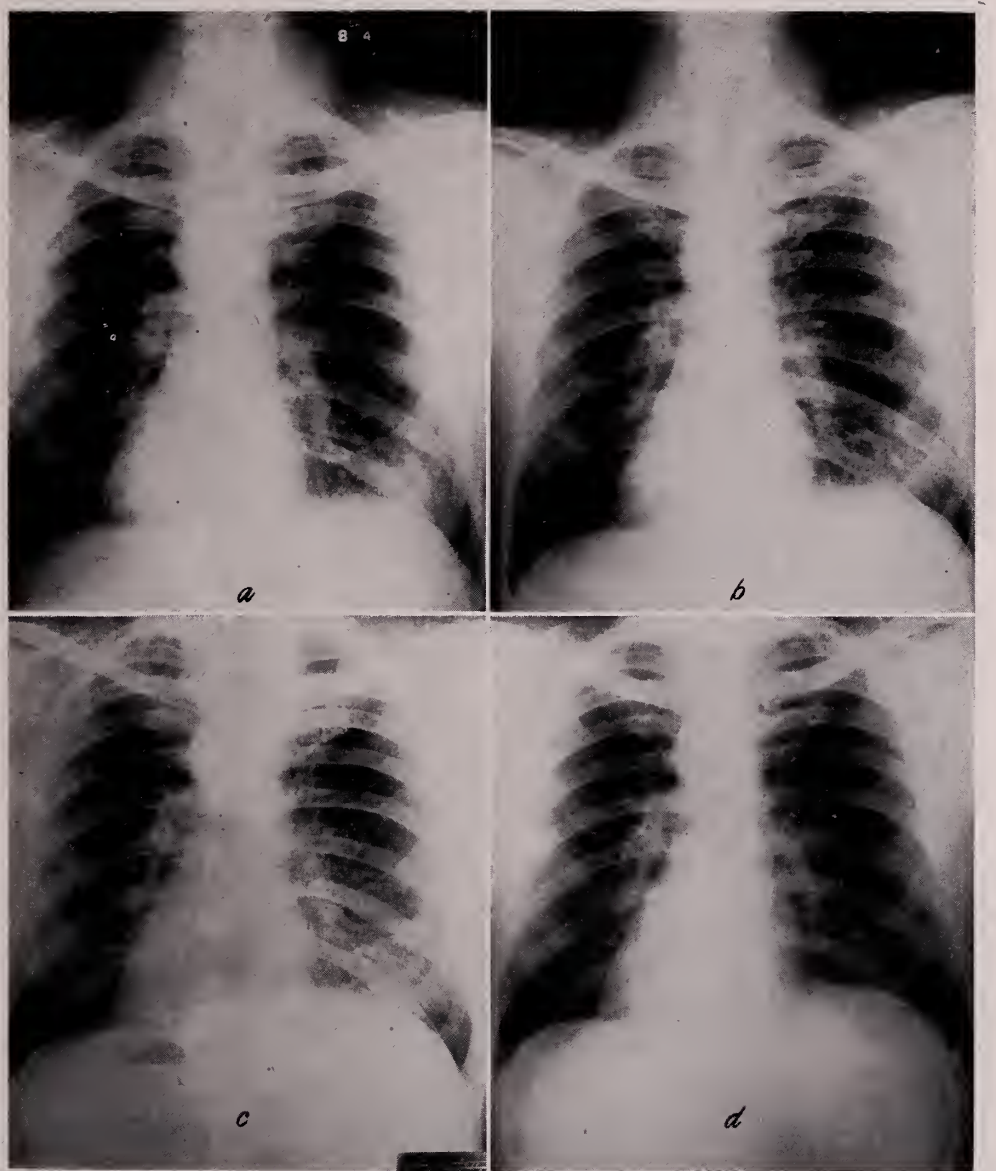

Fig. 1a. Roentgenogram taken August 4, 1953, showing an area of mottled, irregular, poorly defined density involving the right hilar region and lower lobe of the right lung. Primary atypical pneumonia is suggested.

b. In a film taken August 17, the diffuse density persists. Unresolved pneumonitis seems evident.

c. August 24 the diffuse mottling is more widespread in the lower lobe of the right lung. The pneumonitis is unresolved.

d. By September 10 a roentgenogram shows the lower lobe of the right lung to be almost completely clear. The pneumonitis is resolving.

carefully sought. In 3 cases of primary atypical pneumonia, the finding of an enlarged spleen suggested testing for ornithosis. In each instance, the complement-fixation tests were positive.[5]

Since the disease is a nonspecific pneumonitis, in all cases of primary atypical pneumonia one should carefully question for a history of bird contact—"fleeting" or intimate, and if the spleen is enlarged, obtain a complement-fixation test for ornithosis.

The importance of the finding of an enlarged spleen is well emphasized by MacLachlan, who noted that in uncomplicated pneumococcic pneumonia, it is rare to find splenic hyperplasia; that in the influenza epidemic of 1918, an enlarged spleen at autopsy was rare; and finally, that in experimental animal infection, as well as in the natural disease of birds, splenic enlargement is characteristic of ornithosis.

The severity of the illness is milder in the young, who appear to be less susceptible, and most serious in the aged. The disease has a greater incidence in women, since they are most often engaged in the care of birds.

Favour[2] classified ornithosis into the following three groups: mild, with influenzal illness and a short course; moderate, with typhoidal state and pneumonia, lasting approximately four weeks; and severe, with marked toxic manifestations, widespread pneumonia, and a course lasting several months, occurring especially in older people with underlying disease.

Mortality has been reduced from 40 to 10 per cent with present-day antibiotics. In 1950, Hurst, of England, working with experimental animals, demonstrated the ornithosis virus to be decreasingly sensitive to Terramycin, Aureomycin, Chloromycetin, and penicillin,[10] with sulfonamides showing little or no effect.[1] More recently, erythromycin has demonstrated activity against the virus.[6]

In the differential diagnosis of ornithosis, one must consider influenza, typhoid, and primary atypical pneumonia. A negative Widal reaction and stool culture will help eliminate typhoid. Absence of cold agglutinins and agglutinins for Streptococcus MG eliminate primary atypical pneumonia. Absolutely to rule out influenza, negative complement-fixation tests and failure to isolate the influenza virus would be necessary.

For positive laboratory confirmation of ornithosis, one can isolate the virus from the blood, throat washings, vomitus, or sputum, and inoculate this material into white mice. After incubation, the Macchiavello bodies may be identified in the spleen and other reticuloendothelial tissues.

Working with the virus directly is dangerous because of the high element of contagiousness. A safer procedure is complement-fixation testing. This may be accomplished with the use of either Squibb's Lygranum as the lymphogranuloma venereum (LGV) antigen or Lederle's psittacosis antigen.

At the end of the first week of the disease, there is a positive complement-fixation in a 1:16 dilution. Specimens taken from the fourth to the eighth week of illness will show a positive reaction with steadily rising dilutions, usually to a 1:64 titer. Several months after convalescence, there is a fall in the complement-fixation level, and unless a carrier state develops or there is constant reexposure, it usually becomes negative by the eighth month.

In carriers, the complement-fixation level may remain stable for years. Persons constantly exposed (for example, aviary owners) show, as a rule, complement-fixation titers of from 1:8 to 1:32, and their immunity decreases unless they experience constant reexposure. Rasmussen and Meyer, reporting on proved second attacks, demonstrated that immunity is not absolute. Members of the family of a patient with ornithosis have been known to develop positive complement-fixation titers without clinical evidence of the disease, secondary to their exposure.

CONTROL MEASURES

Because of the contagiousness of this disease, it is recommended that there be rigorous isolation during the febrile period, and since antibiotics which produce rapid lysis are used, the isolation should be continued for three weeks. Vomitus, sputum, and feces should be disinfected with either phenol or formalin. It is suggested that all cases be reported. There should be investigation of the source, with all suspect birds destroyed and premises disinfected. Inasmuch as Meyer failed to cure experimental parakeet ornithosis carriers with Aureomycin, it should be recognized that imported birds "cured" with antibiotics may possibly cause the spread of the disease.

CASE REPORT

Mr. L. B., a 42 year old male luggage salesman in a large San Antonio variety store, dated the onset of his illness to July 17, 1953. His initial complaints were fever, frontal headaches, photophobia, generalized muscular aching, chills, and insomnia. There was excessive perspiration and dry cough. Physical examination was essentially negative, except for the 102 F. temperature, injected pharynx, and erythematous nasal mucous membranes. A complete blood count and urinalysis were normal. He was treated at home by another physician with 600,000 units of penicillin for two days. Antipyretics and analgesics effected gradual subsidence of symptoms, so that within ten days he was able to return to work. However, he still had a dry cough and an irritated pharynx, and complained of weakness.

On August 3, he went swimming and noticed unusual

fatigue. This was followed in twenty-four hours by a recurrence of his previous symptoms of frontal headaches, photophobia, chilling, fever, and malaise. He was dyspneic and again had a nonproductive cough. He was referred to my office at this time. Physical examination showed a well developed white man, moderately ill, perspiring freely, with a constant hacking cough. All mucous membranes were injected. His temperature was 102.2 F., pulse 100, blood pressure 112 systolic and 72 diastolic. There were a few coarse bronchial rales in the right side of the chest, and some scattered crepitant rales in the region of the lower lobe of the right lung. There was no adenopathy, enlargement of the spleen, or skin rash. The patient denied any contact with rabbits, cattle, birds, polluted water, or insect bites.

The sedimentation rate was 18 mm. in one hour. The white blood cell count was 8,200, with stabs 1 per cent, segmented cells 70 per cent, lymphocytes 28 per cent, and eosinophils 1 per cent. A nasal smear revealed pus cells and was negative for eosinophils. Roentgenograms of the sinuses were negative.

A roentgenogram of the chest showed a normal heart and left lung field, but revealed a definite widespread hazy infiltration of the lower lobe of the right lung, suggesting a pneumonitis. This was considerably more involvement than was anticipated from the sparse physical findings. A diagnosis of primary atypical pneumonia was made, and the patient was started on Terramycin. On August 11, a checkup disclosed residual lung findings both by roentgen ray and physical examination. On August 18, after Terramycin had been discontinued for several days, there was a relapse with a recurrence of the entire syndrome.

The patient was then hospitalized and during the first few days of his course continued to be moderately ill. The fever, frontal headache, and photophobia persisted. There were several episodes of profuse perspiration, and the previous dry cough became productive. Serum was sent to Austin, Texas, for complement-fixation studies for ornithosis. Sputum was studied for bacteria, fungi, and acid fast organisms. Terramycin treatment was again reinstituted on admission of the patient to the hospital and continued for eight days after discharge on August 26. The temperature on admission was 102.2 F. with gradual lysis to normal on the fourth hospital day.

The physical findings in the lung increased, and on the fourth day of hospitalization, the tip of the spleen was palpable but not tender. Because of the persistence of the pulmonary findings in this male patient, and while awaiting the reports of the complement-fixation tests for ornithosis, bronchoscopic examination was performed August 24, with negative findings, including Papanicolaou stains, smear, and culture for the tuberculosis Bacillus and fungus.

The laboratory studies were as follows: August 18, red blood cell count and hemoglobin normal; white blood cells 11,100; stabs 8 per cent; lymphocytes 24 per cent; monocytes 2 per cent; eosinophils 1 per cent. Wassermann negative. Cold agglutinations, August 19 and 24, both negative. Sedimentation rate 85 mm. per one hour (Westergren method—normal 0-18). Agglutinations for typhoid, paratyphoid, Pasteurella tularensis, Brucella, and Proteus 0X19, all negative in twenty-four hours.

Sputum smears for acid fast bacteria and fungi, direct and two month cultures, all were negative. Skin tests for histoplasmin and coccidioidin 1:100 were negative and purified protein derivative (tuberculin) first strength were positive in twenty-four hours.

On August 24, the sedimentation rate was 48 mm. in one hour and the patient was free of fever.

The first serum collected for complement-fixation tests for ornithosis was reported positive with a psittacosis titer of 2 plus at a 1:16 dilution and LGV titer of 2 plus at 1:16. Two weeks later, while the patient was convalescing, a repeat titer of 2 plus was obtained at a 1:32 dilution for psittacosis antigen and 4 plus at 1:32 with LGV. Seven weeks later, approximately fourteen weeks after onset, the titers were 3 plus for psittacosis at 1:32 and 3 plus for LGV at 1:64. The final testing on December 10 (twenty weeks after onset) was 3 plus for psittacosis at 1:64; the LGV reaction was not tested.

The patient had a prolonged convalescence, and it was several months before he was able to perform his work normally. Roentgenograms of the chest showed slow resolution, requiring several months to clear.

After the first positive complement-fixation report was obtained, the patient was questioned again for possible bird contact, but without success. When the second serum showed a rise in titer, and the clinical findings and roentgen-ray changes were even more compatible with ornithosis, I requestioned the patient, this time in the presence of his wife, who distinctly recalled an incident of bird exposure two weeks before the onset of his illness.

A parakeet had escaped from the bird department, three floors below the patient's luggage department, and momentarily alighted upon the luggage display, soiling it with its droppings. The bird was recaptured by the aviary attendant and returned to its cage in the basement. The patient immediately dusted and rearranged his luggage display, thus apparently inhaling the virus in its pulverized form. Follow-up studies disclosed the presence of the virus in the aviary from which this bird escaped.

SUMMARY

Although the virus was not isolated from the patient, the known exposure to a parakeet fourteen days before the onset of the illness, the typical clinical course with characteristic relapses, the pneumonitis, the typical roentgen-ray findings, the enlarged spleen, and the serologic changes with rising titers during convalescence establish the diagnosis of ornithosis in this case.

Whereas it is generally believed that ornithosis need be considered a disease only of birds or of human beings who have prolonged and intimate contact with birds or with infectious patients, more and more cases are appearing in the literature describing patients who have developed the disease as a result of "fleeting" contact with either infected human beings or birds, as in this instance.

I would like to thank J. V. Irons, Sc.D., Director of Laboratories, Texas State Department of Health, Austin, for his interest and help in the serologic studies in this case.

POTENTIAL HEALTH HAZARDS OF ORGANIC INSECTICIDES

DON W. MICKS, Sc. D., Galveston, Texas

FEW fields of research have shown advances parallel to those which have occurred in the development of insecticides during the past decade. Although a fairly large number of insecticidal preparations were available prior to World War II, a definite demand for more and better insecticides existed. This demand was given greater impetus with the entry of the United States into the war. As a result of this demand, phenomenal advances have been made in the development of new economic poisons for the control of insects. For example, in California alone, the number of registered pesticides has doubled in the past ten years so that approximately 10,000 products are now registered in that state. More than 800 new pesticide registrations were listed by the Texas Department of Agriculture for the 1951-1952 fiscal year.[17]

By far the greatest strides have been made in the development of synthetic organic compounds which are effective against a variety of household and agricultural pests. Intensive research in this country and abroad has uncovered a series of chlorinated hydrocarbon compounds ushered in by DDT. Not only are these chemical compounds lethal to insects, ticks, and mites but also they possess remarkable residual properties so that a single application of the material to a surface may continue to be insecticidal for weeks and even months. The more commonly used insecticides in this group are DDT, TDE, methoxychlor, chlordane, toxaphene, benzene hexachloride, lindane (the gamma isomer of benzene hexachloride), aldrin, and dieldrin. These compounds are commercially available in the form of dusts, wettable powders, emulsions, solutions, and aerosols under a variety of trade names.[7] Athough some of these insecticides are used rather extensively in agriculture, the vast majority of people come in contact with them through their availability as household insecticides.

The other major group of newer synthetic insecticides is the organic phosphate compounds which were developed in Germany during World War II. These chemicals are among the most toxic materials used for the control of insect pests. They are employed against aphids, mites, and other agricultural pests but are not marketed for use against household insects. Hexaethyl tetraphosphate (HETP), tetraethylpyrophosphate (TEPP), and parathion have been the most commonly used organic phosphate compounds in this country. They are mixed with other materials to make dusts, wettable powders, emulsifiable concentrates, and aerosols. Although these agents are highly toxic to mammals as well as insects, they do not possess the long lasting residual properties characteristic of the chlorinated hydrocarbon insecticides. For this reason they are highly desirable for the control of insects on fruit and vegetable crops since residues which remain on treated plants do not present the danger of food contamination that is inherent in the chlorinated compounds.[20]

It is inevitable that as more powerful insecticides are developed, these chemicals likewise will be more toxic to man. This may present a particular problem in Texas and other southern states where insect control in some areas must be actively engaged in, either agriculturally or domestically, most of the year. Under such conditions, a great deal of insecticide is used and consequently it seems likely that more accidents involving these toxic materials may occur. The history of accidental poisoning with any of the newer economic poisons, however, is usually a history of

From the Laboratory of Medical Entomology, Department of Preventive Medicine and Public Health, University of Texas Medical Branch.

Read before the Section on Public Health, Texas Medical Association, Annual Session, Houston, April 29, 1953.

carelessness, where the person concerned has failed to follow either written or verbal instructions as to how he may protect himself from harmful exposure. That insecticides can be handled with comparative safety is borne out by the fact that the processing of highly concentrated materials in industrial plants over a period of years has resulted in a relatively low incidence of insecticide poisoning. In fact, Princi and Spurbeck[21] were unable to find evidence of harmful effects in 34 workers engaged in the manufacture of chlordane, aldrin, and dieldrin. McGee and others[16] reported that there were no cases of toxaphene poisoning during a five year period in a large group of workers involved in the manufacture of toxaphene. Furthermore, certain of these toxic compounds have undergone wide scale use with apparent safety. Aldrin, for example, was used extensively in the form of an oil solution to control locusts in Persia with no reports of casualties.[3] These findings, however, emphasize the fact that persons engaged in the manufacture or other professional aspects of insecticides are taught how to obtain maximum personal protection against their potentially toxic effects, whereas people in general are largely unaware of the nature of the materials used in their homes.

To protect the public in the use of economic poisons, the Federal Insecticide, Fungicide, and Rodenticide Act was enacted in 1947. This law regulates the marketing of insecticides, fungicides, rodenticides, and herbicides in interstate commerce. Products subject to the act must be registered with the United States Department of Agriculture prior to introduction into interstate commerce. In order that the users of insecticides and other economic poisons may employ them safely and effectively, the label on each product must contain certain essential information. Among other things, the name and percentage of each active ingredient must be given as well as directions for use. A warning or caution statement must be included, when necessary, to prevent injury to man, animals, vegetation, and useful invertebrate animals. If the product is highly toxic, it must contain the word poison in red, the skull and crossbones, and a statement of an antidote. Still further protection is afforded the public by state laws which require registration of pesticides before they are offered for sale in that state.[10]

Despite these important safeguards, some persons are careless in the handling of insecticidal preparations and never bother to read the directions on the label. Others may discontinue observing the suggested precautionary procedures because they become convinced that the insecticide is safe. Since these persons may become patients, it is important for physicians to be able to recognize symptoms of both acute and chronic poisoning by the newer synthetic organic insecticides and to know how to treat such cases. It is with this idea in mind that the following material is presented.

CASE REPORTS

The following reports represent 2 instances of illness which probably were due to accidental poisoning by chlordane solution:

CASE 1.—A 3 year old Negro girl swallowed an undetermined amount, probably about 15 to 20 milliliters, of a commercial insecticide containing 2 per cent chlordane. This solution had been left in a drinking glass on the kitchen table. According to the mother, the child became nauseated and vomited shortly after swallowing the material. The patient was taken to the hospital emergency room about an hour later and upon arrival was noted to have a generalized convulsive seizure. Gastric lavage was begun immediately and was continued until the washings were clear and free of insecticide odor. The convulsions were controlled successfully with phenobarbital. After a period of further observation the patient was allowed to return home. Although she was reported to have spent an extremely restless night, recovery appeared to be complete the following morning.

The past history revealed that the child previously had been in good health and never had exhibited any neurologic symptoms.

CASE 2.—A white boy, aged 10 months, was sprayed with an insecticide solution on the head, face, neck, and trunk by his 3 year old brother. The commercial preparation involved contained 2 per cent chlordane and was sprayed on the child with an ordinary insect spray gun. When the child's mother became aware of the incident a few minutes later, she examined the child and found that his hair and skin in the above mentioned area were wet with the material. The child was wearing only a diaper at the time the spraying occurred. The mother immediately washed his hair and face as well as the other contaminated areas with soap and water. Within an hour after this episode occurred, the child became hyperirritable and cried hysterically for at least thirty minutes. At this time it was noted that his eyes were extremely inflamed and swollen. A physician was called and the mother was advised to wash the child's eyes with a cool boric acid solution. The following day conjunctivitis was the only remaining symptom although the skin still smelled of insecticide. The odor remained in the hair for three days.

The past history revealed that the child had developed normally and was in good health.

Few cases of insecticide poisoning from formulations of chlordane have been reported. Recently, Lemmon[14] reported a case of chlordane intoxication in a woman which he attributed to inhalation of fumes from a 1 or 2 per cent chlordane solution. About the same time Lensky and Evans[15] reported a case of chlordane poisoning in a young girl who accidentally swallowed a small quantity of a suspension of the material. Their findings add important information to existing knowledge of symptomatology of insecticide poisoning in man inasmuch as

their case was one of insecticide poisoning per se without an accompanying solvent to confuse the issue. Although a 2 per cent chlordane solution was involved in both cases presented in the present report, the material was accidentally swallowed by the patient in the first instance whereas absorption through the skin apparently occurred in the other patient. The possible effects of the solvent cannot be excluded: however, the symptoms presented were those which one would expect to see in persons poisoned with a chlorinated hydrocarbon. The comparatively mild reaction exhibited by the patient in the second case when exposed to a solution of chlordane most likely can be attributed to the promptness with which the material was washed off the skin.

SYMPTOMATOLOGY

Although a considerable amount of valuable information has been obtained from human cases of insecticide poisoning, accidental and otherwise, the bulk of our knowledge of the comparative pharmacology, toxicology, and symptomatology of the synthetic organic insecticides necessarily has been derived from animal investigation. The data obtained from these studies cannot be transposed always to fit man, and yet it is the most reliable and practical method available for estimating the relative toxicities of these insecticides for man. Table 1 presents Lehman's[11] interpretation of the predominant symptoms which may be produced in man by some of the more common chlorinated hydrocarbon insecticides. In general, it can be seen that this group of compounds primarily affects the central nervous system. The estimated fatal dose varies from as little as 7 Gm. for toxaphene to 450 Gm. for methoxychlor. The degree of toxicity of an insecticide, however, depends in a large measure upon the concentration, the formulation or type of material with which it is mixed, and the route of exposure. Absorption occurs from the alimentary tract, respiratory tract, and skin. The fact that these compounds are insoluble in water makes it necessary to use a petroleum solvent. Although wettable powders and dusts are poorly absorbed through the skin, Lehman[12] has found that multiple exposure of the skin to insecticides in solution constitutes a real hazard. His data, which are given in table 2, clearly indicate that whereas a single massive dermal exposure to an insecticide may not cause serious consequences, repeated exposure to small quantities of the material may cause marked intoxication. For example, more than 1,880 mg. of benzene hexachloride per kilogram of body weight are required to produce a medial lethal dose in rabbits with a single acute exposure, whereas less than 200 mg. per kilogram of body weight in repeated daily doses are sufficient for a medial lethal dose. In this connection, it is important to note that the solvent may contribute largely to the over-all toxicity of an insecticide, and even the solvent alone may produce in man intoxication, the symptoms of which closely simulate those due to a chlorinated hydrocarbon insecticide.[18] Differential diagnosis lies in the fact that symptoms of solvent poisoning occur promptly, whereas there generally seems to be a delay of an hour or more following exposure to an insecticide.

The symptoms of insecticide poisoning may be divided into two categories, acute and chronic. The acutely ill patient is easy enough to recognize since he usually presents such symptoms as nausea, vomiting, hyperirritability, and lack of muscular coordina-

TABLE 1.—*Summary of Major Toxic Actions of Insecticides Interpreted in Terms of Human Toxicology.*

Compound	Local Effect	Predominant Symptoms	Estimated Fatal Dose (Gm.)	Period
DDT	None	Giddiness, nervous tension, involuntary muscular tremors, convulsions, depression, respiratory failure, death	30	2-24 hr.
Methoxychlor	Slight irritation	Questionable tremors, depression	450	2-4 days
TDE	Slight irritation	Lethargy	300	1-4 days
Chlordane	Irritation	Convulsions, depression repeated several times, deep depression, death	5-60	1-4 days
Toxaphene		Epileptiform convulsions and death	7	4-24 hr.
Benzene hexachloride	Irritation	Hyperirritability to outside stimulus, occasionally convulsions, depression, death	30	1-5 days

Adapted from Lehman, A. J.: Pharmacological Considerations of Insecticides, Assoc. Food and Drug Officials U. S. Quart. Bull. *13*:65-70, 1949.

TABLE 2.—*Dermal Toxicity of Chlorinated Insecticides to Rabbits.*

Insecticide	Skin Irritation	Approximate LD_{50} (mg./kg.) Single Exposure*	Multiple Exposure†
DDT	None	> 2,820	150
TDE	Moderate	1,200	200-400
Methoxychlor	Slight	> 2,820	600
Benzene hexachloride	Moderate	> 1,880	< 200
Lindane	None	> 188	20-50
Toxaphene	Moderate	< 780	40
Chlordane	Severe	< 780	20-40
Aldrin	None	< 150	< 5
Dieldrin	None	< 150	< 5

Adapted from Lehman, A. J.: Chemicals in Foods: Report to Association of Food and Drug Officials on Current Developments; Part 2, Pesticides; Section 2, Dermal Toxicity, Assoc. Food and Drug Officials Quart. Bull. *16*:3-9 (Jan.) 1952.

*These animals received a single acute (24 hour) exposure to a solution of the insecticide in dimethylphthalate, an innocuous solvent.

†The results are based on 90 day exposure periods, except for a 21 day exposure period for lindane and 4 to 14 doses of benzene hexachloride, aldrin, and dieldrin.

tion, all of which may or may not precede convulsions and death. The detection of chronic poisoning, however, may be somewhat more difficult unless a careful history is taken. The history of such patient should reveal frequent multiple exposures which may or may not be of fairly long standing. This patient may complain of a headache, general malaise, loss of appetite, and loss of weight. The severity and type of symptoms depend to some degree upon the extent to which a given insecticide is stored in the body, specifically in the adipose tissue.[9] Chlordane, aldrin, and dieldrin, for example, are stored in fatty tissue and likewise are known to have a high order of chronic toxicity.[1, 9] On the other hand, toxaphene and methoxychlor evidently are not stored in the fat in significant amounts apparently because they are metabolized.[13] The diagnosis should be based on a record of exposure along with the characteristic neurologic manifestations.

Toxicologically, the organic phosphate insecticides differ markedly from the chlorinated compounds and therefore must be considered separately from the standpoint of symptomatology.[6, 20] HETP, TEPP, parathion, and other members of the organic phosphate group are specific enzyme inhibitors which exert their toxic effects by inactivating the plasma and red blood cell enzyme, cholinesterase. This action leads to an accumulation of acetylcholine in the tissues. The resulting symptoms therefore resemble those produced by excessive stimulation of the parasympathetic nervous system. Depending upon the extent of exposure to any one of these insecticides, anorexia, nausea, vomiting, abdominal cramps, sweating, salivation, restlessness, and anxiety may be the prominent symptoms. More extensive exposure may produce diarrhea, pinpoint nonreactive pupils, blurred vision, respiratory embarrassment, and death. Grob[20] has pointed out the important fact that when symptoms begin there actually may be little warning as to the seriousness of the toxic effects, since the margin between the pharmacologic effect and doses that are lethal seems small. The reduction in blood cholinesterase and accumulation of acetylcholine may be a reversible process up to a point beyond which death inevitably occurs. The average time interval between the onset of symptoms and death has been given as nine hours.[20]

Tissue storage of HETP and TEPP apparently does not occur as with certain chlorinated insecticides because these materials are detoxified rapidly by hydrolysis in the body. Parathion, however, is detoxified at a slower rate and it has been shown by animal experimentation that repeated exposure to this material may result in subacute intoxication. Since inflammatory changes in the skin are not produced by the organic phosphates, it is possible that absorption by this particular route may go unnoticed completely until recognizable symptoms appear.

TREATMENT AND PREVENTION

There is no specific antidote for poisoning from any of the chlorinated hydrocarbon insecticides and treatment, therefore, is symptomatic.[18, 19, 23] If the material has been ingested, treatment should be directed toward removing it from the stomach and intestinal tract by gastric lavage followed by a saline cathartic. It is particularly important to determine, if possible, the constituents of the material swallowed, since such information serves as a guide for more specific treatment. It should be noted that oil cathartics are definitely contraindicated since absorption of the insecticide is enhanced thereby. Central nervous system manifestations such as tremors and convulsive seizures can be controlled by barbiturates, phenobarbital being the drug of choice. Pentobarbital sodium is indicated to control violent convulsions. Epinephrine should be avoided since it may produce fatal ventricular fibrillation. Once the patient has recovered from the acute stages of poisoning, it is advisable to keep him on a fat free or at least a low fat diet, and he should be treated for liver damage if indicated. The same symptomatic treatment is recommended for persons poisoned by absorption of insecticide solutions or emulsions through the skin.

Symptoms of poisoning from any organic phosphate insecticide are treated with atropine.[20] This procedure should be supplemented with gastric lavage or, if the material gets into the eyes, ocular irrigation. The recommended dose of atropine is 2 mg. intramuscularly at hourly intervals or more frequently if necessary until the patient has become atropinized. Morphine is contraindicated inasmuch as it depresses respiration. The administration of oxygen and artificial respiration also may be necessary auxiliary measures.

If insecticides are to be used safely, there are certain precautionary measures which must be adhered to strictly. Persons employing insecticides in the form of dusts, sprays, mists, and aerosols must avoid excessive inhalation of the material. Operators engaged in the large scale application of any of these formulations should wear respirators and other protective devices. Measures should be taken to keep the materials out of the eyes and mouth. When solutions or emulsions are used, particularly concentrates, every effort should be made to prevent them from contacting the skin. Material which is spilled on the skin should be washed off immediately with soap and water. When solutions or emulsions are spilled on the clothing, the garments should be changed.

Workers involved in the mixing of these materials, particularly concentrates, should wear respirators, goggles, and solvent resistant gloves, aprons, and boots. This work should be done in a well ventilated room, and fire precautions should be taken with inflammable solvents. Personnel such as pilots who are working with or engaged in the routine application of organic phosphate compounds should wear full face masks as well as respirators. Furthermore, they should undergo periodic tests to determine cholinesterase levels. If cholinesterase activity is reduced significantly, these persons should be removed from further exposure until such time as this enzyme resumes a normal level.

Insecticides employed against household pests should be used according to the directions given on the label. Exposed food and cooking and eating utensils should be covered when the kitchen or dining room is being sprayed. Care should be taken to avoid contact of insecticide with children's toys, cribs, and play pens. It is advisable to apply solutions with a paint brush where possible since inhalation of the spray or mist thereby is avoided. When aerosol bombs are used in a closed space, the area should be well ventilated before occupancy.

In July, 1949, the United States Public Health Service initiated a program wherein economic poisons are investigated from the standpoint of relative toxicities, mode of action, and applicable antidotes.[22] This work is conducted in the toxicology laboratory of the Technical Development Branch of the Communicable Disease Center in Savannah, Ga. This agency likewise prepares clinical memorandums[4] on each of the more important economic poisons to guide the physician in the diagnosis and treatment of persons who have been exposed to toxic amounts of the material.

About this same time, the Council on Pharmacy and Chemistry of the American Medical Association was becoming more aware of the need for integration of the existing information on pesticides so that it might be readily available to physicians. Consequently, in 1950, the council authorized the formation of a Committee on Pesticides,[5] the purpose of which is to promote better coordination of effort between medical and other activities concerned with pesticides as well as to assist the physician when confronted with the medical aspects of the problem. Accordingly, this committee has published a series of carefully prepared reports[8, 18, 19, 20, 23] which integrate and interpret the available data on various insecticides as to their pharmacology, toxicology, and symptomatology as well as the treatment of human cases of insecticide poisoning. These reports will be supplemented with information on additional insecticides as they are developed. In this connection, physicians are in a position to offer helpful assistance not only in the prompt recognition and treatment of patients with insecticide intoxication but also in reporting such cases. For the past several years the Laboratory of Medical Entomology of the University of Texas Medical Branch, Galveston, has been assisting physicians of the state in the evaluation of suspected cases of poisoning from insecticides, and the staff welcomes the opportunity to cooperate in such cases.

Unquestionably, there is a definite need for potent insecticides with which to combat the more than 85,000 kinds of insects, ticks, and mites which are known to cause extensive injury to plants, animals, and man in this country.[10] This is emphasized by the staggering losses as a result of insects which in the United States average about $4,000,000,000 per year. It also is clear that untold numbers of people, including members of our armed forces overseas, have been protected by insecticides from disabling and sometimes fatal insect-borne diseases such as malaria, filariasis, and typhus. The benefits derived from the use of the newer economic poisons far outweigh the dangers, which in the final analysis are largely inherent in the improper handling of insecticidal materials. The problem which confronts public health workers, therefore, is not whether the use of the newer synthetic organic insecticides should be discontinued because of their potentially hazardous nature; rather, it is a matter of educating the public so that it is aware of the toxic nature of the materials so commonly employed in the constant battle against insects. As stated by Justus C. Ward,[24] chief of the Pharmacological and Rodenticide Section, Insecticide Division, United States Department of Agriculture, "Much has yet to be learned about the actual danger from pesticides to the person who uses them only occasionally and in acceptable dilutions. This is particularly true in the household-spray field. It is here where the least experienced individual handles and stores poisons. It is important that the householder be taught that such products must be handled in accordance with directions to be safe."

ABSTRACT OF DISCUSSION

DR. PAUL LENSKY, Houston: Dr. Micks has emphasized the large number of newly discovered insecticides and the resulting number of commercially available pesticides. Each pesticide is formulated somewhat differently by the many distributors, and consequently there are thousands of varying formulas on the market in many forms.

More recently most of these products have been labeled by law as poisonous, and instructions for their use are on the labels. This is true of all preparations sold through interstate commerce but not necessarily of locally packaged pesticides. Therefore, most cases of poisoning will result from carelessness, as Dr. Micks pointed out, or through ignorance. Even professionals are still guilty of mishandling these toxic substances.

Only a few weeks ago our office laboratory technician had her apartment sprayed with 10 per cent chlordane. The company handling this procedure is a large concern, yet the exterminator used no self-protective equipment in spraying this closed dwelling. As our technician is aware of the potential dangers of chlordane, she questioned the man about any precautions and found that he had no realization of the danger; he had been told nothing by his employers. I am certain that he performs similar sprayings many times a day and many days a week, thus inhaling chlordane and other insecticides over a long period. These multiple skin exposures are a hazard even if the doses ate small each time.

As was pointed out, acute poisoning is easy to recognize, but chronic poisoning is often difficult to diagnose. A careful history must be taken, especially including the occupation and avocations of the patient. Symptoms may be only malaise, loss of weight, headache, and others of a nonspecific nature. It is difficult to prove these cases, except to see improvement after withdrawal of the insecticide, as no tests can be done except in the case of the organic phosphates in which the cholinesterase level may be determined.

It should be emphasized that patients with acute organic phosphate poisoning must be recognized and treated early as death occurs in a matter of hours. The chlorinated hydrocarbons usually do not prove fatal for several days. Fortunately, there is a specific antidote for the organic phosphates—atropine. There is no antidote for the chlorinated compounds.

Compared on a body weight basis, fatal doses of insecticides are almost the same in insects as in warm blooded animals. The least toxic of insecticides actually may not be the safest since larger quantities of the poison must be used to insure effective insect control.

Dr. Micks' first case is almost a duplicate of a case reported by Dr. Evans and me. Our experience pointed out the lack of information which was available as the 50 per cent chlordane powder came in a single cardboard ice cream box labelled "50% Chlordane" with instructions to use one tablespoonful to a quart of water in mixing. There was no indication that the chlordane was a poison. Luckily, we used magnesium sulfate as a lavage material rather than any other substance which might have enhanced the chlordane's absorption. Our patient was probably sicker because of the longer time before lavage was performed.

Since most insecticides will be handled by inexperienced persons and householders, it is important that emphasis be placed on the potential dangers involved in the use of these new agents. Education for safe handling should be universal.

Schering Award Subjects Announced

Medical students are invited by the Schering Corporation, 2 Broad Street, Bloomfield, N. J., to submit manuscripts on "The Use of Androgen Therapy in the Female," "The Prophylactic and Therapeutic Uses of Parenteral Antihistamines," or "Modern Treatment of Infections and Allergic Disorders of the Eye" in a contest to win $500 first prize and $250 second prize for the best papers on each subject. Manuscripts, which may be by individuals or teams, must be submitted by October 1, but entry forms specifying the chosen title must be in by July 1.

"Unless our national civil defense program receives our immediate attention, we are going to have a defense system which is entirely out of balance.... The finest military forces in the world could not operate long if the enemy smashes its home base behind it. It is the people and production of this country that make our most feared weapons. But it will be the people and production that are wide open to death and disaster on a staggering scale—if we do not have a civil defense program ready when attack comes."—U. S. Congressman Gordon Canfield.

Surgically Significant Anomalies of Biliary Passages

W. R. WHITEHOUSE, M. D.; R. W. KIMBRO, M. D.; and J. S. RICE, M. D., Cleburne, Texas

"TO DO good many times is not enough; evil once is too much," might well apply to the surgeon's dilemma following an operative complication resulting from a moment of carelessness or neglect. Too often the region of the gallbladder is dissected casually without adequate concern for the anatomic variations possible. *Perhaps even more than one of ten operations on the gallbladder will reveal one or more anomalies.* These distortions of "textbook normals" are important causes for tragic complications which carry a high morbidity and mortality. Hence the following outline and series of drawings.

I. Purpose.

A. To recount

1. That operations upon the gallbladder and its ducts are increasingly frequent among elective and emergency procedures, because of patient education, efficient diagnostic procedures, expanded indications, and the often pseudosecurity of advanced drug therapy.
2. That complications related to gallbladder surgery are found in increasing numbers and present some of the most formidable problems to be faced in surgery.
3. That many operators are unaware of the potential pitfalls in anatomic variants found in from 10 to 20 per cent of gallbladder operations.

B. To present the collected anomalies from the literature as well as the theoretical anomalies which may occur and dramatically affect surgical morbidity and mortality.

C. To outline the specific complications related to careless gallbladder surgery, showing by composite diagrams how these may occur all too easily, and to indicate accepted technical essentials in prevention of these disasters.

II. Complications related to gallbladder surgery.

A. Hemorrhage.

B. Peritonitis.

1. Bile.
2. Bacterial.

C. Hepatic insufficiency.

D. Duct fistulas.

E. Obstructive jaundice—stones.

F. Duct and vascular stricture.

III. Technical essentials in preventing complications.

A. *Knowledge of normal and anomalous anatomy.*

B. Adequate exposure.

C. Good lighting.

D. Careful dissection of ducts and vessels.

E. Identification of structures with careful clamping and separate ligation, without common duct damage.

F. Doubtful dissections begun at the fundus downward.

G. Careful control of hemorrhage by compression and ligation.

H. Ligation of severed accessory bile ducts to avoid bile abscesses.

IV. Comment.

A. It is realized that pediatric surgery of the gall ducts will reveal agenesis and numerous other anomalies, upon which only 25 per cent will permit a definite surgical procedure. These cases in newborn infants have been largely excluded from this presentation and space given instead to adult findings.

B. One has only to examine the anatomy of the area around the junction of the cystic and common ducts to see how easily a forceps may be misapplied and how segments of ducts or vessels may be destroyed, mistakenly ligated, or otherwise injured.

V. Conclusion.

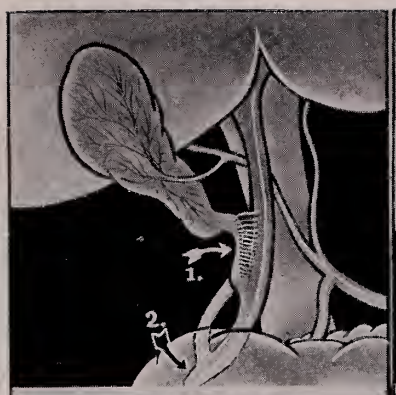
A. The surgeon's possible lack of information regarding anomalies and variations in normal anatomy of the biliary passages (10 to 20 per cent of cases) coupled with careless technique, is a definite problem in surgery.

B. Composite diagrams to reveal all of the reported anomalies are presented on successive pages, and listed are technical guides designed to prevent surgical disaster.

C. The major factor involved is an adequate knowledge of the variety of anatomic arrangements; then only is intelligent action possible.

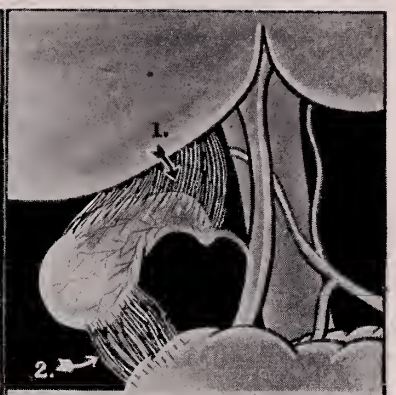
Presented as a scientific exhibit, Texas Medical Association, Annual Session, Houston, April 27-29, 1953. Winner of honorable mention.

Kimbro Clinic.



1. ENSHEATHED OR FUSED PARALLEL JUNCTION OF CYSTIC AND COMMON DUCTS (14-27%).
2. SHORT COMMON DUCT (VARIABLE LENGTH 2-12 CM.) WITH RETRODUODENAL JUNCTION OF CYSTIC AND COMMON DUCTS

PENDULOUS HARTMAN'S POUCH CONGENITALLY ADHERED TO DUODENUM, PERHAPS ADHERED TO THE COLON, STOMACH OR MESENTERY.



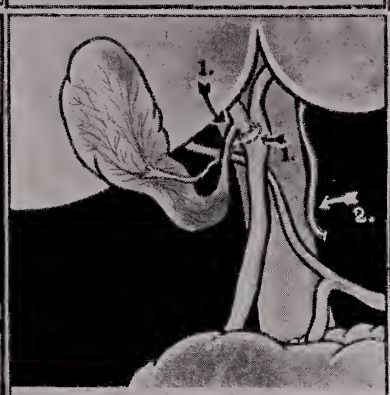
1. GALL BLADDER AND/OR CYSTIC DUCT SUSPENDED BY MESENTERY (TORSION MAY OCCUR)
2. BANDS TO DUODENUM AND/OR STOMACH, COLON, OMENTUM.

1. GALL BLADDER LOCATED RETRO-DUODENAL AND RETRO-PERITONEAL[1a]
2. ANTERIOR POSITION OF THE GASTRO-DUODENAL ARTERY ON THE COMMON DUCT (10%)

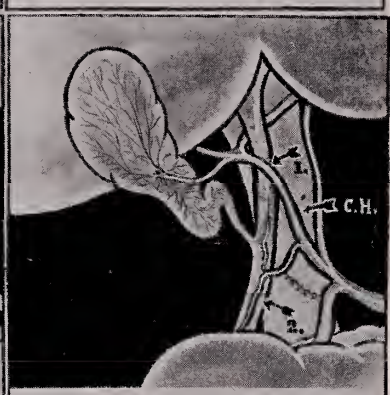
1. CYSTIC DUCT PARTLY ENSHEATHED WITH THE RIGHT HEPATIC DUCT (17%)
2. CONGENITAL STENOSIS OF SPHINCTOR ODDI OR OF THE PANCREATIC AND COMMON DUCT JUNCTION.

ANTERIOR SPIRAL JUNCTION OF CYSTIC AND HEPATIC DUCTS (10%) (JUNCTION MAY BE POSTERIOR, OR RIGHT OR LEFT LATERAL)

1. CYSTIC DUCT TERMINATING IN THE STOMACH
2. ANTERIOR OR POSTERIOR DUODENAL INSERTION OF THE CYSTIC DUCT



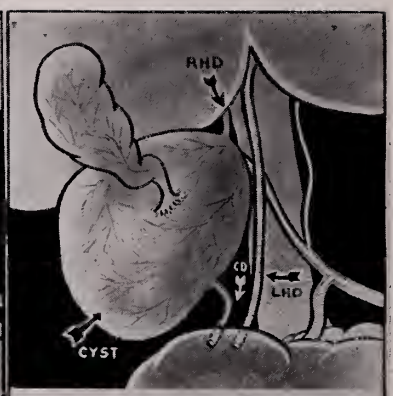
1. CYSTIC DUCT ENTERING RIGHT HEPATIC DUCT ANTERIORLY OR AT AN AMPULARY ENLARGEMENT OF THE HEPATIC DUCT JUNCTION. (EXTRA-HEPATIC JUNCTION OF THE RIGHT AND LEFT HEPATIC DUCTS)
2. ANOMALOUS OR ABERRANT (REPLACING) LEFT HEPATIC ARTERY FROM THE LEFT GASTRIC ARTERY



1. ANTERIOR CROSSING OF THE COMMON HEPATIC DUCT BY THE COMMON HEPATIC ARTERY (15%) (RIGHT HEPATIC ARTERY 3%)
2. THE SUPRA-DUODENAL ARTERY, A BRANCH OF HEPATIC OR GASTRODUODENAL ARTERY LOCATED IN THE ANTERIOR WALL OF THE COMMON DUCT. (30-50%)

1. DOUBLE CYSTIC ARTERIES (15%) AND (NOTE ONE ANTERIOR TO THE COMMON HEPATIC DUCT) CYSTIC AND ACCESSORY CYSTIC ARTERIES MAY ARISE FROM THE RIGHT, LEFT, OR COMMON HEPATIC ARTERIES OR GASTRODUODENAL ARTERY
2. BRANCH OF THE COMMON HEPATIC ARTERY OR GASTRODUODENAL ARTERY IN THE ANTERIOR WALL OF THE COMMON DUCT (30-50%)

1. RIGHT HEPATIC DUCT TERMINATING IN THE CYSTIC DUCT
2. HEPATIC ARTERY PASSING ANTERIOR TO THE COMMON DUCT (12%)
3. SUPERIOR PANCREATICO-DUODENAL ARTERY, A BRANCH OF THE HEPATIC ARTERY.



CONGENITAL CYST OF THE COMMON DUCT
ABSENCE OF THE COMMON HEPATIC DUCT

CYST OF THE COMMON DUCT LOCATED WITHIN THE GASTRO HEPATIC LIGAMENT.

1. DIVERTICULUM OF THE GALL BLADDER — (SIZE AND LOCATION VARIABLE)
2. REDUPLICATION OF THE CYSTIC DUCT

1. PHRYGIAN CAP (FOLDED FUNDUS)
2. MOBILE COMMON DUCT WITH POORLY DEFINED CYSTIC DUCT JUNCTION

1. CYST OF THE COMMON HEPATIC DUCT PARTIALLY EMBEDDED IN LIVER
2. CYSTIC ARTERY ARISING FROM THE COMMON HEPATIC ARTERY.

DOUBLE GALL BLADDER WITH CYSTIC DUCTS CROSSED (GALL BLADDERS AND DUCTS MAY BE FUSED)

1. GALL BLADDER LOCATED WITHIN THE LIVER SUBSTANCE
2. GALL BLADDER SITUATED ON THE LEFT SIDE OR UNDER THE LEFT LOBE OF THE LIVER (MAY BE IN THE VERTICAL POSITION OR LOCATED HORIZONTALLY IN THE TRANSVERSE FISSURE)

1. THE REPLACING RIGHT HEPATIC ARTERY ARISING FROM INFERIOR OR SUPERIOR MESENTERIC, GASTRIC, RENAL OR AORTIC ARTERIES. TWO HEPATIC ARTERIES MAY OCCUR ANTERIOR OR POSTERIOR TO THE COMMON HEPATIC DUCT. (ACCESSORY HEPATIC ARTERIAL BRANCHES MAY BE FROM THE RIGHT GASTRIC, SUPERIOR MESENTERIC OR AORTIC ARTERIES.)
2. DOUBLE GALL BLADDER WITH SINGLE CYSTIC DUCT

1. DOUBLE GALL BLADDER, ONE TERMINATING IN THE HEPATIC SUBSTANCE
2. ANOMALOUS HEPATIC BRANCH OF THE CYSTIC ARTERY (ABNORMAL ORIGIN FROM THE HEPATIC ARTERY.)

1. ACCESSORY GALL BLADDER IN THE GASTRO HEPATIC LIGAMENT COMMUNICATING WITH THE LEFT HEPATIC DUCT.
2. SMALL RUDIMENTARY GALL BLADDER (MAY BE ENTIRELY ABSENT)

1. PARTITIONED GALL BLADDER AND A DECEPTIVELY SHORT BUT LARGE CYSTIC DUCT

CASE REPORTS

DELAYED DEATH FOLLOWING DISK SURGERY

C. E. KERN, M.D., McKinney, Texas

THE syndrome of the low lumbar herniated nucleus pulposus is widely recognized and well understood.

A case in which death occurred two years after surgery for herniated disk, and apparently as a result of that surgery, is sufficiently unusual and the diagnosis could so easily be missed, that in my opinion such a case must be reported. A search of the literature failed to reveal a reference to this type of case.

The results to be expected when disk surgery is done by competent surgeons are widely recorded. Good results as reported in the literature occur in from 60 to 85 per cent of all patients operated upon. It is also noted that about 5 to 7 per cent will have recurrence of the disk herniation.

The fact that death will occasionally result from even the most minor of surgical procedures is a disconcerting but well known fact. Death resulting from surgery for herniated nucleus pulposus is extremely rare, well below .5 per cent of all cases in which operation is performed. The cause of such death, if the death is a direct result of the surgery, is usually a wound infection with resulting immediate meningitis. Another fatal complication is rupture of the aorta or inferior vena cava. This latter occurs as a surgical accident when a surgeon is so unfortunate as to insert the punch used in removing disks anteriorly into the retroperitoneal space and traumatize one of these large vessels.

CASE REPORT

M. F. L. was first admitted to the Veterans Administration Hospital, McKinney, Texas, in March, 1949. He was an extremely well developed man of 41 years. He gave a history of intermittent low back and left sciatic pain of five years' duration. The patient presented himself for definitive treatment because the syndrome had become completely disabling during the preceding two months. The physical examination and history were typical of herniated nucleus pulposus at the fourth lumbar interspace. A myelogram was interpreted as showing a herniated disk on the left side at the fourth lumbar interspace. Inasmuch as the man was completely incapacitated with pain and had suffered numerous attacks, it was decided to explore this disk. At operation a classic herniated nucleus pulposus was found and handled in the usual manner without difficulty. The pain was relieved, and the patient was discharged on April 6, 1949.

The second admission to the hospital occurred one year later on April 14, 1950. The man had experienced complete pain relief until a few weeks prior to admission, when he had slipped on the ice and had a sudden recurrence of the low back and left sciatic pain. This pain was exactly similar in all respects to that of which he had complained before the first operation. There was absolutely no relief on prolonged bed rest. The physical examination was practically identical with that observed on the first admission. Again a myelogram indicated the presence of a herniated disk at the fourth lumbar interspace on the left.

The neurosurgeon decided that this interspace should again be explored. The orthopedic department thought that in view of the recurrence of this herniated disk a fusion should be done from the fourth lumbar vertebra to the sacrum. This surgery was performed May 5, 1950. A few small fragments of cartilage were found jammed beneath the fifth lumbar nerve root at the fourth lumbar interspace on the left side and were removed with no difficulty. The orthopedists then performed a type of fusion routine in this institution. Screws were placed bilaterally through the facettes joining the fifth lumbar vertebra and the sacrum and through those joining the fourth and fifth lumbar vertebrae. Bone was taken from the iliac crest and a fusion accomplished without unusual difficulty and in a completely routine manner. Eleven days later an elevation of the patient's temperature to 101 F. occurred, and it was noted that the upper end of the wound was fluctuant. This area was aspirated, serosanguinous fluid obtained, and Staphylococcus aureus was cultured. Open drainage and antibiotic therapy were instituted and the wound promptly healed. The man was ambulatory by the first of June. Roentgenograms on June 16 showed a slight area of destruction around the upper of the two screws on the right side. (It is to be remembered the disk had been removed on the left.) Removal of this screw was considered, but in view of the fact that the patient was completely asymptomatic it was decided not to do so.

The patient was reexamined on February 15, 1951. He had had occasional mild and fleeting attacks of back pain, but on the whole he considered his surgery to be highly successful. Complete roentgen-ray studies on this occasion were interpreted as indicating that a solid fusion existed, and no signs of osteomyelitis were recognized.

The final admission of the patient was to the orthopedic service on November 8, 1952, or approximately thirty months after the final surgery in 1950. The history at this time indicated that one week prior to admission this patient began to have some mild low back pain and within a day or so observed a sensation of numbness in his right thigh. He also mentioned that the entire right side of his body felt slightly numb. On the evening prior to admission the patient had experienced a mild chilly sensation, was thought to have had a mild fever, and complained of increased back pain. His physician gave Demerol for the pain and advised readmission to the Veterans Administration Hospital. The man had a comfortable night and came to the hospital the next morning.

Examination on admission revealed nothing particularly unusual. There was slight tenderness over the operative site, the pulse was 80, the temperature 97 F., and the patient was not considered to be seriously ill. Thirty hours after admission he complained of abdominal distension and was given an enema. Three hours later he became disoriented and his

temperature was found to be 102 F. He had an extremely stiff neck plus the other clinical signs of meningitis. A spinal tap at the second lumbar interspace yielded spinal fluid with the consistency and color of milk. This fluid contained 173,000 white blood cells with 95 per cent polymorphonuclears, and the smear contained many bacteria which were thought at the time to be pneumococci.

Immediate medical consultation was obtained. Because of the type of organisms seen in the spinal fluid and the fact that the internist suspected early pneumonia, a tentative diagnosis of pneumococcic meningitis was made. The patient was transferred to the medical service. During the night he became much worse. The temperature rose to 105 F. and the pulse to 160, and the man became extremely maniacal. The following morning a medical consultant described early choking of the optic disks, and asked the neurosurgeon to see the patient. The neurosurgeon requested and obtained roentgenograms of the low lumbar spine, even though the examination had to be done under light Pentothal anesthesia. These roentgenograms demonstrated osteomyelitis, particularly on the right side around the area of the fourth and fifth lumbar vertebrae. This infection involved the fusion mass. The upper of the two screws on the right side had migrated backward and was within 15 mm. of the skin surface. By this time the patient was deeply comatose, the pulse was still 160, and his temperature was 104.8 F. Cultures of the spinal fluid had proved that the meningitis was due to staphylococcus, and the blood culture indicated a Staphylococcus aureus septicemia. Sensitivity tests showed that the organism was sensitive to Aureomycin and penicillin, with only the slightest sensitivity to sulfadiazine. Since being transferred to the medical service, the patient had received 8,000,000 units of penicillin and 2 Gm. of Aureomycin.

It was decided to operate immediately on the presumptive diagnosis of osteomyelitis, epidural abscess, and secondary meningitis, for the purpose of draining the epidural area.

This surgery was performed twenty hours after the first meningeal signs were noted. It was found that the upper of the two screws on the right, that between the fourth and fifth vertebrae, was completely loose. This screw was inadvertently pushed back into the original drill hole while opening the wound. The fourth and fifth lamina on the right side were almost destroyed by osteomyelitis. There was a large gap, or pseudoarthrosis, in the fusion mass at the same level. The surrounding bone was obviously grossly infected, and an epidural granulation tissue mass extended backward through and posterior to the pseudoarthrosis. When this granulomatous mass was entered at a level posterior to the fusion, a large quantity of milky fluid escaped. This at first appeared to be pus, but was later recognized as milky spinal fluid. The screws were removed and a rather wide area of bone removed from over the dura. There was a hole .5 cm. in diameter through the dura under the center of the mass of granulation tissue. After a sufficiently wide laminectomy had been performed, the entire wound was irrigated with penicillin and the wound loosely packed open.

The neurosurgeon interpreted the findings as representing epidural granulation tissue and abscess accompanying osteomyelitis of the fusion mass and surrounding lamina, and a fistula between the epidural abscess and the subarachnoid space.

Microscopic examination of the tissue showed changes consistent with an osteomyelitis and acute cellulitis. Around the periphery of the granulation tissue the pathologist reported infected collagenous tissue which would indicate some chronicity of this process.

The patient remained unconscious after operation, but his temperature rapidly came down to 100 F., the pulse slowed to 100, and his general condition improved. On the third day a minor left sided convulsion occurred, and on the fourth day after surgery a left hemiplegia was noted. The patient had several more convulsions. Huge doses of penicillin and Aureomycin were given at short intervals. The patient had several transfusions, and his fluid balance was accurately controlled. The convulsions ceased after Luminal sodium was given, and on the fifth postoperative day the patient became conscious. Although not completely oriented, he was able to recognize and talk to hospital personnel. On the sixth day he abruptly lost consciousness again, his temperature rose, and he died.

Autopsy.—The autopsy showed that the fluid in the spinal subarachnoid space and the ventricles was clear. There was osteomyelitis of the fusion and bone surrounding the fourth and fifth lumbar area. The dural fistula had sealed with filmy adhesions. The leptomeninges of the spinal cord were thickened and covered with a yellowish exudate which histologically contained many polymorphonuclear cells. Staphylococcus aureus could still be cultured from this exudate. There was a thick tenacious exudate throughout the basal cisterns including the chiasmatic cistern. Over the convexity of the right cerebrum an even thicker exudate was found. It developed on sectioning the brain that the veins over this area were thrombosed, as was the sagittal sinus. The abdomen contained 500 cc. of fluid and there was a large perforated duodenal ulcer, the edges of which microscopically showed almost no recognizable reaction. There were several other unruptured hyperacute ulcers of the duodenum and upper jejunum.

DISCUSSION

In the opinion of the neurosurgeon who had final charge of this patient, the following set of events occurred. The patient had a wound infection following the surgery in 1950. He probably developed low grade, perhaps minor, staphylococcic osteomyelitis. For thirty months this infectious process remained indolent or very slowly progressive, and for some reason just prior to admission this infection became much more active. It is possible, although improbable, that the patient had meningitis at the time of his final admission to the hospital. It seems more likely that the symptoms of backache and leg numbness were due to cauda equina or nerve root pressure incident to the growth of the epidural granulation and abscess mass. The meningitis probably developed suddenly in the hospital following an enema, at which time the epidural abscess ruptured into the subarachnoid space, giving a fulminating staphylococcic meningitis and septicemia.

Since surgery and the antibiotics apparently had controlled the septicemia, the final complications appear to have been due to more or less mechanical factors inherent in the heavy exudate over the brain surface and the resulting thrombosis of cerebral veins. The final episode was obviously perforation of an unsuspected duodenal ulcer, of the type described by Cushing as complicating hypothalamic injury.

Certain points are glaringly obvious in this case.

The most outstanding concerns the fact that delayed serious infection, in this case delayed thirty months, can and does occur following surgery performed in proximity to the central nervous system. If this possibility had been given earlier consideration, it is entirely possible that this man might now still be alive.

Another point to be seriously considered is whether or not a foreign body, in this case a screw used in the fusion, may be responsible for the continuation of the immediate postoperative infection. In this particular instance the neurosurgeon regards this screw as an important element, although his orthopedic colleagues do not concur. The latter agree with the remainder of the rationale here presented.

CONCLUSION

A case of osteomyelitis, epidural abscess, and fatal fulminating meningitis occurring thirty months after disk removal and spinal fusion has been presented.

It is probable that the operation was directly responsible for this sequence of events.

The question is raised as to the wisdom of using metallic means of fixation in fusions of this type. This can be answered only by future experience.

Veterans Administration Hospital.

Retrovesical Sarcoma: A Case Report

HERBERT L. WARRES, M.D., and ALBERT C. KING, M.D.,
Laredo, Texas

PRIMARY malignant tumors of the retrovesical area are rare. Lazarus, in an extensive review of the literature, found only 3 cases of sarcoma of the retrovesical region involving the seminal vesicle. We wish to report such a case.

CASE REPORT

D. R., a 70 year old white man, was seen at Mercy Hospital April 4, 1952, because of inability to urinate of one day's duration. Hesitancy, small urinary stream, frequency, and nocturia had been present for several years prior to the present illness.

The patient appeared chronically ill and in acute pain. Temperature was 102 F.; blood pressure, 160/100. The bladder was distended to the umbilicus. On rectal examination a hard fixed nodular mass extending from the urogenital diaphragm to as high as the examining finger could reach was palpable anteriorly. The remainder of the physical examination was essentially negative. An indwelling urethral catheter was inserted and a liter of urine obtained.

Urinalysis was normal. Results of a complete blood count were as follows: red blood cells 3,360,000, hemoglobin 7.1 Gm., white blood cells 16,850 per cubic millimeter, neutrophils 97 per cent, lymphocytes 3 per cent. A serologic examination was negative. Blood urea nitrogen was 66.5 mg. and creatinine 5.8 mg. per 100 cc. of blood. Alkaline phosphatase was 1.75 units, acid phosphatase 0.95 units. A flat plate roentgenogram of the abdomen showed a large mottled area of calcification measuring 7.5 by 6.5 cm. overlying the bladder region. Intravenous urography disclosed no function of either kidney even on a one hour film.

A diagnosis of a large vesical calculus which had eroded into the prostate was made. Cystoscopy was deemed unnecessary. Because of the poor renal function, it was considered advisable to continue drainage by catheter for an extended period; the patient was discharged with the urethral catheter in situ.

One month later the patient, having improved remarkably, refused to keep the catheter in place or to undergo surgery. The catheter was removed. Eight days afterward the patient was readmitted to the hospital with chronic urinary retention and uremia. Blood urea nitrogen was 106 mg. and creatinine 10.4 mg. per 100 cc. of blood. The patient again improved with catheter drainage.

On readmission for surgery, a flat plate roentgenogram of the abdomen demonstrated no change in the calcified mass previously seen. The electrocardiogram was within normal limits. Blood urea nitrogen was 13.3 mg. and creatinine 4.9 mg. per 100 cc.

A suprapubic cystotomy was done July 14, 1952, under general anesthesia. When the bladder was opened, a large trilobar prostate was seen but no vesical calculus was present. The prostate was easily enucleated. Posterior to the prostatic capsule, a large hard mass was palpable. The prostatic capsule and trigone were incised in the midline. The tumor mass was encapsulated and lay between the rectum, bladder, and prostatic capsule. The tumor was freed by blunt dissection. Because of its large size, it could not be delivered intact through the posterior bladder incision; however, finally it was removed in its entirety. A large vaginal pack was inserted into both the retrovesical cavity and the prostatic fossa. The bladder was closed around a Pezzer catheter.

Pathology.—Gross: Two specimens were received, the prostate and a separate tumor, both in several pieces. When the parts of the tumor were rejoined, it was seen to have an irregular rounded shape. It was slightly flattened on two surfaces, having a diameter of 7.5 cm. and a thickness of 4 cm., and was hard and calcified. The outer surface was irregularly lobulated. Lobules varied between 3 mm. and 1.5 cm., some calcified and yellow, others fleshy pink. Calcified areas were in the majority. The surface was partially covered by strips of what appeared to be a capsule, through which portions of the tumor protruded. In cross section there seemed to be a cord of pink papillary and lobulated soft tissue, around which was formed a layer of calcium. The calcified portion varied between a few millimeters and 3 cm. in thickness. The calcium was in the form of spicules which were easily broken apart. Gray tissue like that of the central cord protruded along the calcium fragments, separating clusters of them. The soft portion of the tumor reached the outer surface of the tumor.

From The Medical and Surgical Clinic.

FIG. 1. A case of retrovesical sarcoma.
Left. Preoperative roentgenogram revealing a large mottled calcified mass in the vesical region.
Right. Flat film made one year postoperatively disclosing no evidence of calcification in the vesical region. On rectal palpation, however, recurrence was noted.

The prostate was large, rubbery, firm, and irregularly formed. Most of the surfaces were covered with a transparent capsule. On section the cut surfaces were moist, milky, and rather irregularly lobulated.

Microscopic: The tumor was a spindle cell growth. The cells were arranged in swirling, interlacing bundles; they were numerous in some areas, and in others were replaced by their cytoplasmic secretion. The secretion began as vacuolation in the cell. Material, first amorphous, then granular or myxomatous, was deposited. It became fibrillar in some areas, but never collagenous. In most places calcium was deposited in the secretion in dense, granular masses. Osteoblasts, presumably differentiating from the tumor cells, were numerous. Bone formation occurred in only a few places. Mitoses in the spindle cells were present. They were few and attested to the malignant nature of the tumor.

Diagnosis.—Calcifying spindle cell sarcoma. Benign nodular hyperplasia of prostate. (Dr. William J. Emerson.)

The patient was discharged July 25, 1952. A course of deep roentgen therapy was given. Seven months later he complained of dull pain in the right groin. Rectal examination revealed a hard area the size of a pigeon's egg on the right. Additional roentgen therapy was recommended.

One year after surgery the inguinal pain was still dull but bilateral. The lesion was beginning to encircle the rectum, was softer, and was not calcified. No residual urine was present. Further roentgen therapy was being given.

DISCUSSION

Tumors of the retrovesical region may arise either from the seminal vesicles; vestigial remnants such as the Mullerian ducts; or the fibrous tissue, muscle, nerves, and vessels between the bladder and the rectum. By the time a growth in this area produces symptoms, it usually has involved the seminal vesicles, prostate, and surrounding tissue. Therefore, the exact point of origin often remains in doubt.

Symptoms in these cases are first referable to the urinary bladder. In our patient the associated benign prostatic hypertrophy probably was the primary cause of the acute urinary retention. Despite recurrence of the growth, the patient has remained almost asymptomatic. Response to deep roentgen therapy has been negligible.

SUMMARY

A case of retrovesical sarcoma and associated benign prostatic hypertrophy is reported.

POSTDOCTORAL FELLOWSHIPS

Fellowships for one or more years at an approved school of public health and one to three years postdoctoral clinical fellowships at training centers approved for residencies in physical medicine and rehabilitation are being offered by the National Foundation for Infantile Paralysis. Selection of candidates will be on a competitive basis, and stipends will be based on individual need.

Short-term fellowships are also available for physicians who wish to become better acquainted with physical medicine and rehabilitation as it relates to their particular specialties.

Complete information may be obtained from the foundation's Division of Professional Education, 120 Broadway, New York 5.

United States-Mexico Border Public Health Association, Albuquerque, N. M., April 6-9, 1954. Mr. Richard F. Poston, San Francisco, Pres.; Dr. Sidney B. Clark, 314 U. S. Court House, El Paso, Secy.

STATE

Private Clinics and Hospitals Association of Texas. Dr. W. R. Swanson, Taylor, Pres.; Dr. John Dupree, Levelland, Secy.

Texas Academy of General Practice, Galveston, Sept. 9-11, 1954. Dr. C. Forrest Jorns, Houston, Pres.; Dr. Woodson W. Harris, 1410 Nickerson, Austin, Secy.

Texas Academy of Internal Medicine. Dr. Martin S. Buehler, Dallas, Pres.; Dr. George M. Jones, 1314 Medical Arts Bldg., Dallas, Secy. Meetings restricted to members.

Texas Air-Medics Association, San Antonio, May 2-3, 1954. Dr. George L. Gallaher, Harlingen, Pres.; Dr. J. S. Minnett, 2512 Welborn, Dallas, Secy.

Texas Association of Blood Banks, Abilene, Dec. 3-4, 1954. Dr. C. T. Ashworth, Fort Worth, Pres.; Miss Marjorie Saunders, 3500 Gaston Ave., Dallas. Secy.

Texas Association of Obstetricians and Gynecologists, Houston, February, 1955. Dr. G. F. Goff, Dallas, Pres.; Dr. Carey Hiett, 815 Fifth Ave., Fort Worth, Secy.

Texas Chapter, American College of Chest Physicians, San Antonio, May 2, 1954. Dr. Henry H. Hoskins, San Antonio, Pres.; Dr. Walter C. Brown, 1733 S. Brownlee Blvd., Corpus Christi, Secy.

Texas Club of Internists. Dr. Joseph F. McVeigh, Fort Worth, Pres.; Dr. Charles Darnall, Capital National Bank Bldg., Austin, Secy.

Texas Dermatological Society, San Antonio, May 2, 1954. Dr. Maurice Barnes, Waco, Pres.; Dr. Thomas L. Shields, 1216 Pennsylvania Ave., Fort Worth, Secy.

Texas Diabetes Association, San Antonio, May 2, 1954. Dr. Raymond L. Gregory, Galveston, Pres.; Dr. Edmond K. Doak, 501 Hermann Professional Bldg., Houston, Secy.

Texas Division, American Cancer Society. Mr. Travis Wallace, Dallas, Pres.; Mr. J. Louis Neff, 1609 Colorado, Austin, Executive Director.

Texas Heart Association, San Antonio, May 3, 1954. Dr. Joseph McVeigh, Fort Worth, Pres.; Miss Roberta Miller, 412 Fidelity Union Life Bldg., 1511 Bryan St., Dallas, Executive Secy.

Texas Hospital Association, Houston, May 18-20, 1954. Mr. W. U. Paul, El Paso, Pres.; Mrs. Ruth Barnhart, 2210 Main St., Dallas, Secy.

Texas Neuropsychiatric Association, San Antonio, May 2, 1954. Dr. James Blair, San Antonio, Pres.; Dr. John L. Otto, John Sealy Hospital, Galveston, Secy.

Texas Orthopedic Association, San Antonio, May 3, 1954. Dr. Edward T. Smith, Houston, Pres.; Dr. Margaret Watkins, 3629 Fairmount St., Dallas, Secy.

Texas Pediatric Society, Fort Worth, October, 1954. Dr. Robert L. Moore, Dallas, Pres.; Dr. James N. Walker, 3616 Tulsa Way, Fort Worth, Secy.

Texas Proctologic Society. Dr. Herbert T. Hayes, Houston, Pres.; Dr. John McGivney, 2202 Avenue L, Galveston, Secy.

Texas Public Health Association. Dr. Roy G. Reed, La Marque, Pres.; Mr. Earle W. Sudderth, Dallas County Health Department, Court House, Dallas, Executive Secy.

Texas Radiological Society, Houston. Dr. E. F. Lyon, Jr., San Antonio, Pres.; Dr. R. P. O'Bannon, 650 Fifth Ave., Fort Worth, Secy.

Texas Railway and Traumatic Surgical Association, San Antonio, May 3, 1954. Dr. William E. Crump, Wichita Falls, Pres.; Dr. W. D. Marrs, 306 Broadway, Fort Worth, Secy.

Texas Rheumatism Association. Dr. Alfred H. Harris, Dallas, Pres.; Dr. Charles H. Cornwell, Marlin, Secy.

Texas Society for Mental Health, Waco, March 4-6, 1954. Mrs. Frank Schoonover, Fort Worth, Pres.; Mrs. Elizabeth F. Gardner, 2504 Jarratt Ave., Austin 21, Executive Secy.

Texas Society of Anesthesiologists, San Antonio, May 2, 1954. Dr. James B. Robinett, Jr., Houston, Pres.; Dr. C. R. Allen, John Sealy Hospital, Galveston, Secy.

Texas Society of Gastroenterologists and Proctologists, San Antonio, May 3, 1954. Dr. Cecil O. Patterson, Dallas, Pres.; Dr. W. T. Arnold, 1402 Hermann Prof. Bldg., Houston, Secy.

Texas Society of Ophthalmology and Otolaryngology, San Antonio, Dec. 3-4, 1954. Dr. John L. Matthews, San Antonio, Pres.; Dr. Gadin Mitchell, 1604 Medical Arts Bldg., Fort Worth, Secy.

Texas Society of Pathologists, San Antonio, May 3, 1954. Dr. John J. Andujar, Fort Worth, Pres.; Dr. Lloyd R. Hershberger, Shannon Memorial Hospital, San Angelo, Secy.

Texas Surgical Society, Waco, April 5-6, 1954. Dr. Dudley Jackson, Sr., San Antonio, Pres.; Dr. Albert W. Hartman, 414 Navarro St., San Antonio 5, Secy.

Texas Tuberculosis Association, Dallas, April 9-10, 1954. Dr. R. G. McCorkle, San Antonio, Pres.; Miss Pansy Nichols, 208 E. Ninth, Austin, Executive Secy.

Texas Urological Society, Corpus Christi, 1954. Dr. S. J. R. Murchison, Fort Worth, Pres.; Dr. A. J. Ashmore, 255 Medical Dental Bldg, Corpus Christi, Secy.

DISTRICT

First District Society, Pecos, 1955. Dr. John W. O'Donnell, Alpine, Pres.; Dr. H. D. Garrett, First National Bldg., El Paso, Secy.

Second District Society, Sweetwater, April 15, 1954. Dr. T. D. Young. Sweetwater, Pres.; Dr. Francis Hood, Sweetwater, Secy.

Third District Society, Amarillo, April 13, 1954. Dr. Robert A. Neblett, Canyon, Pres.; Dr. James T. Hall, 1626 Fifteenth St., Lubbock, Secy.

Fourth District Society, San Angelo, Fall, 1954. Dr. P. M. Wheelis, Brownwood, Pres.; Dr. James N. White, San Angelo, Secy.

Fifth and Sixth Districts Society, Corpus Christi, July, 1954. Dr. Y. C. Smith, Sr., Corpus Christi, Pres.; Dr. Robert J. Sigler, 1126 Third Street, Corpus Christi, Secy.

Seventh District Society, 1954. Dr. Benjamin Clary Bates, Austin, Pres.; Dr. William McLean, 4618 Burnet Road, Austin, Secy.

Eighth District Society. Dr. Howard Z. Fretz, Wharton, Pres.; Dr. George E. Glover, Jr., Victoria, Secy.

Ninth District Society, Brenham, March 25, 1954. Dr. George D. Bruce, Baytown, Pres.; Dr. Lyman C. Blair, 1212 Rothwell, Houston, Secy.

Tenth District Medical Society, Nacogdoches, April 17, 1954. Dr. Edmund D. Jones, Beaumont, Pres.; Dr. O. W. Harris, Jr., Liberty, Secy.

Eleventh District Society, Crockett, April 15, 1954. Dr. John Dean, Crockett, Pres.; Dr. Marlin T. Braswell, Henderson, Secy.

Twelfth District Society, Corsicana, July 13, 1954. Dr. Neil Buie, Marlin, Pres.; Dr. Paul H. Mitchell, Corsicana, Secy.

Thirteenth District Society, Fort Worth, March 24, 1954. Dr. William E. Crump, Wichita Falls, Pres.; Dr. Robert D. Moreton, 815 Medical Arts Bldg., Fort Worth, Secy.

Fourteenth District Society, Denton, 1954. Dr. J. W. Atchison, Gainesville, Pres.; Dr. L. W. Johnston, 502 W. College St., Terrell, Secy.

Fifteenth District Society, Longview, April 20, 1954. Dr. Bain Leake, Gladewater, Pres.; Dr. George Tate, Longview, Secy.

CLINICS

Dallas Southern Clinical Society, Dallas, March 15-18, 1954. Miss Helga Boyd, Medical Arts Bldg., Dallas 1, Executive Secy.

Central Texas Spring Clinic, Waco, April 7, 1954. Dr. Walter B. King, 2320 Columbus Ave., Waco; Secy.

International Medical Assembly of Southwest Texas, San Antonio, Feb. 24-26, 1955. Dr. John M. Smith, Jr., 205 Camden St., San Antonio, Secy.

New Orleans Graduate Medical Assembly, New Orleans, March 8-11, 1954. Dr. Maurice E. St. Martin, Room 103, 1430 Tulane Ave., New Orleans 12, Secy.

North Texas-Southern Oklahoma Fall Clinical Conference, Wichita Falls, Sept. 22, 1954. Dr. L. N. Simmons, 1518 Tenth St., Wichita Falls, Chairman.

Oklahoma City Clinical Society Conference, Oklahoma City, Oct. 25-28, 1954. Miss Alma F. O'Donnell, 512 Medical Arts Bldg., Oklahoma City 2, Executive Secy.

Postgraduate Medical Assembly of South Texas, July 19-21, 1954. Dr. Edward T. Smith, 906 Hermann Professional Bldg., Houston, Secy.

State Tumor Conference, Wichita Falls, March 31, 1954. Dr. Bailey R. Collins, 925½ Scott Street, Wichita Falls, Director.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin, April 23-24, 1954. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabh, 1714 Medical Arts Bldg., Fort Worth, Secy.

Blasingame to Speak for AAPS

Nine speakers have been announced for the April 1-3 meeting of the Association of American Physicians and Surgeons to be held in Jackson, Miss. Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association and Trustee of the American Medical Association, is among those named. Others include Dr. Lewis A. Aleson, Los Angeles, past president of the California Medical Association; George S. Benson, Searcy, Ark., president of Harding College; Mrs. Mary D. Cain, Summitt, Miss., editor and publisher; Dr. M. G. Ewing, Amory, Miss., president of the Mississippi State Medical Association; Dr. Thomas G. Goldsmith, Greenville, S. C., president of AAPS; J. Bracken Lee, Salt Lake City, governor of Utah; Dr. Stirling S. McNair, Jackson, Miss., president of the Central Medical Society of Mississippi; and Hugh White, Jackson, Miss., governor of Mississippi.

No registration fee will be charged members and guests, and ladies are invited to attend the programs of speeches, exhibits, and president's luncheon and annual banquet. Tickets for the latter events will be on sale. Requests for room reservations and for additional information should be addressed to the AAPS, 360 North Michigan Avenue, Chicago.

Some of San Antonio's many attractions are the Nix Professional Building *(upper left)* which includes a storage garage, offices, and a modern hospital; the new maternity wing of the Baptist Memorial Hospital *(upper right)*, a hospital which now includes the old Physicians and Surgeons and the Medical and Surgical Hospitals; La Villita, "the little town" *(center left)*, where entertainment for the Association's President will be held May 4; the famous Alamo *(center)*, the shrine of Texas liberty; San Jose Mission *(center right)*, built in 1720 and known as the "Queen of the Missions" for its architecture and sculpture; and the San Antonio River *(lower left)*, which winds 6 miles through the city, including part of the downtown business district. Pictured lower right is the San Antonio skyline.

Where Life Is Different

San Antonio, host city for the Texas Medical Association's 1954 annual session May 3 to 5, is known as the city "where life is different," a "city of contrasts." With its romantic past and colorful present, San Antonio combines the old world charm with the modern and arrives at a picturesque contrast.

The medical facilities in the city show evidence of the modern. During the past few years extensive modernization projects, including new buildings, additional facilities, and late model equipment, have been under way among the nineteen hospitals and clinics in San Antonio.

The Robert B. Green Memorial Hospital, one of the oldest community charity hospitals in Texas, is being enlarged to approximately 375 beds and completely modernized under a $3,000,000 improvement plan. The hospital will have a new five-story wing and other additions for surgery, emergency, clinical laboratory, x-ray, autopsy, main kitchen, and storeroom.

The Baptist Memorial Hospital several years ago opened a new obstetrics building, complete with new, modern equipment. The hospital also provided a new sprinkler system in the old building and is completing new parking space to accommodate an additional eighty automobiles.

A third remodeling project, the Santa Rosa Hospital, is nearing completion, with added facilities for a hundred beds and a new operating room which will represent an investment of almost $3,000,000.

A newly constructed 150-bed tuberculosis sanatorium located about 12 miles from the city is part of the county hospital system, and bids were to be received in March for a new 600-bed San Antonio State Tuberculosis Hospital to be built adjacent to the present tuberculosis hospital for mental patients, which is part of the San Antonio State Hospital.

In addition to the many hospitals and clinics in San Antonio, there are two large office buildings principally devoted to the medical profession. The Medical Arts Building, classed among the most beautiful architectural structures in the South, houses a modern hospital on the top floor of the ten-story building. The other office building chiefly used by physicians is the Nix Professional Building, which was built after national research to determine the type building which would be most suitable for medical offices and a hospital as well as other modern conveniences. The twenty-four-story building is composed of a storage garage for tenants and patients, offices for physicians and members of allied professions, and a modern hospital.

Military Center

San Antonio also is the site of the Air Force School of Aviation Medicine, with headquarters at Randolph Air Force Base, the "West Point of the Air." The school is the main laboratory for basic aeromedical research and provides a consultative service for the diagnosis and treatment of unusual medical conditions that are peculiar to fliers. At present, this school is the only institution that offers an integrated training program in the specialty with the cooperation of civilian medical schools and Air Force medical units.

The largest military medical installation in the nation, Brooke Army Medical Center, located at Fort Sam Houston, the largest Army post in the United States, includes Brooke Army Hospital, Medical Field Service School, Fourth Army Area Medical Laboratory, Central Dental Laboratory, Surgical Research Unit, and Hospital Management Research Unit. A seventh unit, the Medical Training Center, is to become a part of Brooke in March when training activities at the Medical Replacement Training Center at Camp Pickett, Va., are taken over by the new unit. Professional activities at Brooke occupy the main hospital building and three large annexes. Administrative and supporting services occupy an additional seventy adjacent, smaller buildings.

The largest capital investment in aviation in the world is located adjacent to San Antonio. In addition to Randolph Field, there are Alamo Field, Stinson Field, Brooks Field, San Antonio Personnel Distribution Center, Kelly Field, which is the nation's largest repair depot for airplanes maintained by the United States Air Force, and Lackland Air Base, the largest United States Air Force training base.

Fort Sam Houston, headquarters for the Fourth Army, and Camp Bullis, San Antonio Quartermaster Depot, and San Antonio Arsenal make San Antonio an army center as well as a military aviation center. For more than 200 years San Antonio has been a military stronghold of the western world. France, Spain, Mexico, the Confederate States of America, the Republic of Texas, and the United States of America have all fought to hold the city.

Historic San Antonio

The city has many attractions in addition to its medical and military establishments. Following the San Antonio River as it winds lazily through the city, one could count for a distance of 6 miles forty-two bridges crossing the river, which has a water level 20 feet below the surface of the streets. Convention guests may wish to tour the city by boat on this river, which flows through part of the downtown business district. The guide may relate the story of the naming of San Antonio, point out places of interest seen along the river bank, and mention other interesting historic sights in the city.

The guide could tell guests that San Antonio was named by the Franciscan Father Damian Massenet, who celebrated the first mass under the great cottonwood trees on the feast day of St. Anthony of Padua in 1691. During the same year that New Orleans was founded by France, 1718, Spain began a chain of missions and fortresses, and on May 1 established the mission-fort of San Antonio de Valero, the chapel of which later became the Alamo.

Located in the heart of downtown San Antonio, the Alamo is the shrine of Texas liberty, for it was there that Travis, Bowie, Crockett, and others courageously fought to the last man against overwhelming odds. But from their deaths came victory. Sparked by the cry, "Remember the Alamo," Texas rallied to win her independence in 1836. The Alamo, as well as the adjoining Alamo Museum and Alamo Library, is open to the public, as are most of the other structures of historic importance.

Within less than 8 miles of the downtown area are four more of these age-old missions, Concepcion, San Jose, Espada, and Capistrano. San Jose, known as the "Queen of the Missions" for its architecture and sculpture, was established in 1720; the other three were established in 1731.

In San Antonio also is found the Spanish Governors' Palace, which blends simple beauty with an air of gracious living in a courtly atmosphere. Carved in the keystone over the entrance is the Hapsburg coat of arms with the date 1749, but the actual date of construction is unknown. The building contains ten rooms furnished in a colonial manner and in the rear is a patio, about which there are many tales of buried treasures, and a picturesque wishing well.

Many of the Association's annual session activities will be held at the Plaza *(upper left)*, Gunter *(upper right)*, and Menger *(lower left)* Hotels. Scientific meetings of related organizations will be held in the Gunter and Plaza Hotels as well as in the Municipal Auditorium. The House of Delegates will convene at the Gunter Hotel. Activities of the Woman's Auxiliary will be held at the Menger Hotel.

In the courtyard of La Villita, "the little town," the Texas Medical Association will entertain for its President on May 4. La Villita was established as a home for soldiers and their families when the first mission was founded in San Antonio. The little stone and adobe buildings of La Villita, covering a full block, have witnessed the transformation of San Antonio from a wilderness outpost to a great, modern city.

Another of San Antonio's many attractions is the beautiful Brackenridge Park, containing one of the nation's largest and finest zoos. The park spreads over 320 acres within the city limits. The Texas Open Golf Tournament is held at the Brackenridge Park course, and the Richard Friedrich Aquarium at the park is one of two west of the Mississippi where rare fish from fresh, salt, and tropical waters are found. The beautiful Chinese Sunken Gardens and the Witte Museum are among the points of interest at the park.

At the direction of the King of Spain in 1730, when a settlement was laid out in what is now San Antonio, two plazas were provided for recreation, and as a result, San Antonio now has more than 2,000 acres of parks devoted to sports, relaxation, and entertainment.

And San Antonio is rich in cultural and light entertainment. The Sunken Garden Theater offers outdoor entertainment as does the unique Arneson River Theater where, against the permanent background of a mission-type building, actors play to spectators seated across the river. Other noted spots include the beautifully designed Municipal Auditorium, where symphonies, operas, and concerts by great artists are held and where most of the activities during the Texas Medical Association annual session will be held, and the new Coliseum, where great trade expositions, livestock shows, circuses, rodeos, and other events are held. The Coliseum is one of the four largest in the country. Top sporting events in the Southwest are held in San Antonio's Alamo Stadium with seating capacity of 23,000; the new Alamo Stadium Gymnasium, with seating capacity of 6,500, is used for exhibitions and shows in addition to athletic events.

Once the home of O. Henry, San Antonio has excellent educational facilities in 101 schools, two junior colleges, and four universities. Much stress is placed on vocational high school training as well as business and professional and art training. San Antonio was the home of many world-famous painters and sculptors and has a spacious Art Institute with beautiful landscaped grounds.

A city of everlasting sunshine, San Antonio is the center of the southwestern Texas livestock industry and has many types of agriculture. With an abundance of raw materials, labor, and markets, a move toward industrial development is the city's newest activity.

Considering the wealth of appeal of the convention city and the arrangements that have been made for this year's meeting of the Texas Medical Association and its Woman's Auxiliary, members will not want to miss this opportunity to visit America's fastest growing major city and to take part in the 1954 annual session.

PERSONALS

Dr. Clyde Elkins, Lubbock, will be a speaker at the annual meeting of the American College of Allergy in Miami Beach, Fla., April 5-10.

Dr. Felix L. Butte, Dallas, was appointed by the Board of Trustees of the American Medical Association to serve on a special committee to study "all aspects of the problems of public relations created by recent adverse publicity." Establishment of the committee was called for at the interim session of the AMA.

Dr. John E. Hill, Marshall, became chief surgeon of the Texas and Pacific Railway Company January 1 at which time *Dr. Carl McCurdy* retired from that position after forty-two years of medical service with the railroad.

Dr. Gordon Madding, San Angelo, has been elected to the Western Surgical Association, of which only four other Texans are members.

Dr. Hamilton Ford, Galveston; *Dr. John A. Wiggins,* Fort Worth; *Dr. Edgar S. Ezell,* Fort Worth; and *Dr. Henry R. Hoskins,* San Antonio, are members of an advisory committee of citizens interested in furthering the program administered by the Board for Texas State Hospitals and Special Schools.

Dr. J. M. Travis, Jacksonville, has been honored with a plaque in the entrance to the Jacksonville city hall commemorating his selection in 1952 as general practitioner of the year by the American Medical Association.

Dr. M. L. Gray, Jacksonville, was recognized for outstanding civic service for 1953 by the local Lions Club, which presented him with a bronze plaque for his work with a well-baby clinic.

Dr. G. V. Brindley, Jr., Temple, defeated his fellow townsman, *Dr. Raleigh White,* to become golf champion of the Southern Surgical Association. Dr. White was the defending champion when the tournament began at Hot Springs, Va.

Dr. J. W. Pittman, Belton physician for thirty-seven years, was honored on a recent birthday by the young adult Bible class of the Church of Christ, of which he is teacher.

Dr. J. C. Kern, Burnet, lost his father, Methodist Bishop Paul B. Kern, in Nashville, Tenn., in December. Bishop Kern had been on the faculty at Southern Methodist University and pastor of the Travis Park Methodist Church in San Antonio.

Mrs. Sarah Ann Guthrie, Floydada, widow of Dr. J. H. Guthrie and mother of *Dr. A. E. Guthrie,* Floydada, died December 17, 1953.

Dr. and Mrs. Herbert Beavers, Fort Worth, have announced the marriage of their daughter Betty to William James Bond on February 6.

Dr. Thomas J. Pennington and Miss Dorothy Nell Reese were married December 30 in Nacogdoches.

Recent births in Fort Worth have been announced as follows: *Dr. and Mrs. H. W. Thomas,* Cecilia Anne, December 22; *Dr. and Mrs. R. E. Snyder,* a boy, January 30; *Dr. and Mrs. T. J. Coleman,* Thomas Joseph, Jr., January 3; *Dr. and Mrs. Emory Davenport,* Karen Beth, December 10; and *Dr. and Mrs. Lawrence P. Kleuser,* Lawrence Joseph, January 21; and in Arlington, *Dr. and Mrs. Robert Brentlinger,* Gary Rae, in December.

Boys have been born recently to *Dr. and Mrs. A. P. Thaddeus,* Galveston; *Dr. and Mrs. G. H. Lang,* Midland; *H. E. and Dr. Grace K. Jameson,* Galveston; and *Dr. and Mrs. J. F. Cox, Jr.,* Houston.

Girls have been born to *Dr. and Mrs. J. E. Green, Jr.,* Ballinger, and *Dr. and Mrs. P. C. Higgs,* Harlingen.

HOLLE NAMED STATE HEALTH OFFICER

Dr. Henry A. Holle, recently regional medical director of regions 1 and 2 (ten states) of the United States Public Health Service with headquarters in New York, was to become state health officer for Texas as soon after March 1 as he could be replaced in his New York position. Announcement of the appointment of the 49 year old native Texan to succeed Dr. George W. Cox, who resigned effective March 1 after seventeen years as head of the Texas State Department of Health, was made in mid-February by Dr. J. B. Copeland, San Antonio, chairman of the State Board of Health.

Born near Brenham, Dr. Holle received his medical degree from the University of Texas School of Medicine in 1927. After an internship in Houston, he practiced in Brenham for six and one-half years before accepting a commission with the United States Public Health Service. Dr. Holle has served in numerous positions, including chief quarantine and immigration officer of the Panama Canal and chief medical officer of a special mission to Poland. Since 1948 he has been in New York, first as regional director for region 2 and recently for the combined regions 1 and 2. Dr. Holle is a diplomate of the American Board of Preventive Medicine and Public Health, a fellow of the American Medical Association and American Public Health Association, and a member of the New York Academy of Sciences.

Dr. Holle was among the "former Texans" who participated in the program of the 1953 annual session of the Texas Medical Association celebrating its centennial anniversary.

Ophthalmologists and Otolaryngologists Meet

The Texas Society of Ophthalmology and Otolaryngology held its twenty-eighth annual session December 4 and 5 in Fort Worth, with Dr. Dohrmann K. Pischel, San Francisco, and Dr. David DeWeese, Portland, Ore., as special guests.

Those on the scientific program in addition to the two guests were Dr. Everett L. Goar, Houston; Dr. Grady Reddick (by invitation), Dallas; Dr. Edwin G. Grafton, Jr., Dallas; Dr. F. H. Newton, Dallas; Dr. Frederick C. Rehfeldt (by invitation), Fort Worth; Dr. Herbert H. Harris, Houston; Dr. Fletcher Clark, Jr., San Antonio; Dr. King Gill, Corpus Christi; Dr. Frederick R. Guilford, Houston; Dr. Claude C. Cody, III, Houston; and Dr. Boen Swinny (by invitation), San Antonio.

Discussions were presented by Drs. Lester H. Quinn, Dallas; C. Keith Barnes, Fort Worth; Oscar Marchman, Jr., Dallas; Oliver Suehs, Austin; Haskell Hatfield, El Paso; Chase Thompson, San Angelo; Dr. Harris; Lyle M. Sellers, Dallas; William McKinney (by invitation), Fort Worth; William C. Grater (by invitation), Galveston; J. M. Robison, Houston. C. O. Haug, M. A., Houston, also took part in a discussion.

New officers were named as follows: Dr. John L. Matthews, San Antonio, president; Dr. A. E. Jackson, Fort Worth, president-elect; Dr. James T. Robison, Austin, vice-president; and Dr. Gatlin Mitchell, Fort Worth, secretary. Dr. J. D. Singleton, Dallas, again will serve as treasurer. Dr. E. D. Dumas, San Antonio, became chairman of the councilors.

Drs. Charles R. Lees, Fort Worth, and A. E. Jackson, Fort Worth, presided over the ophthalmology sessions, and Drs. William J. Snow, Houston, and John Barrett, Houston, presided over the otolaryngology sessions.

Luncheons, golf, cocktails, and a banquet-dance were included in the program.

Physical Therapy Meeting in San Antonio

The Texas Chapter of the American Physical Therapy Association will meet at the Plaza Hotel, San Antonio, May 1 and 2, immediately preceding the annual session of the Texas Medical Association.

Selected orthopedic subjects ranging from management of specific types of fractures to training and rehabilitation of amputees with various types of prostheses, ultrasonics with demonstration of the application of ultrasonic energy, and psychological management of patients with acute and chronic diseases and disabilities will be considered. Professional and commercial exhibits will be on display. Special entertainment at the Indian Village is scheduled for the evening of May 1.

Capt. Mary S. Lawrence, San Antonio, is convention chairman; Mrs. Marion N. Boyer, Dallas, is president.

CENTRAL TEXAS CLINIC IN APRIL

The Central Texas Journal Club has announced plans for its annual spring clinic to be held in Waco on April 7. Members of the Texas Medical Association and physicians on duty with federal agencies are invited to attend without payment of a registration fee.

Speakers at the one day meeting include Drs. Raymond Gregory, Department of Medicine, University of Texas Medical Branch, Galveston; Louis M. Hellman, Department of Obstetrics, Long Island College of Medicine, Brooklyn; Margaret Smith, Department of Microbiology, Tulane University of Louisiana School of Medicine, New Orleans; Robert S. Sparkmen, Department of Surgery, Southwestern Medical School of the University of Texas, Dallas; and Stewart Wolf, Department of Medicine, University of Oklahoma School of Medicine, Oklahoma City.

Further information may be obtained from the secretary, Dr. Walter B. King, Jr., 2320 Columbus Avenue, Waco.

UNIVERSITY OF TEXAS MEDICAL BRANCH

Dr. Charles T. Stone, professor of medicine at the University of Texas Medical Branch, Galveston, has been invited by the government of West Germany to visit German medical and hospital installations and centers. Dr. Stone was to leave early in February for a month's visit in Germany.

Dr. Douglas Guthrie, medical historian of the University of Edinburgh, and Paul Larson, Ph. D., professor of pharmacy at the Medical College of Virginia, Richmond, were recent visitors at the Medical Branch.

NEW AMERICAN ACADEMY OF PEDIATRICS MEMBERS

The following physicians of Texas recently have been elected to membership in the American Academy of Pediatrics: Drs. H. H. Bevil, Beaumont; Frank Cohen, Fort Worth; Albert L. Exline, Jr., Austin; Theodore C. Panos, Galveston; Catherine Juanita Elizabeth Roett, Houston; Gilbert C. Schreiner, Bryan Air Force Base; David I. Schrum, Houston; Virginia S. Stovall, San Antonio; Sam W. Wilborn, Austin; Lee Williamson, Abilene; and John Phillip Fairchild, Fort Sam Houston.

NEW OPHTHALMOLOGY DIPLOMATES

New Texas diplomates of the American Board of Ophthalmology are Dr. Robert E. Nystrom, Abilene; Dr. C. R. Little, Corpus Christi; Dr. Mary A. Lancaster, Dallas; Dr. Robert R. Kelley, El Paso, Dr. Richard E. Leigh, Jr., Houston; Dr. Willis T. Carson, Odessa; and Dr. John W. Linfesty, Sheppard Air Force Base.

Texas Radiological Society

One hundred forty-seven members and visitors attended the meeting of the Texas Radiological Society January 29 and 30 in Dallas. Dr. E. F. Lyon, Jr., San Antonio, became president. Newly elected officers are Drs. Martin Schneider, Galveston, president-elect; J. R. Riley, Corpus Christi, first vice-president; and T. G. Russell, Houston, second vice-president. Dr. R. P. O'Bannon, Fort Worth, remains secretary-treasurer and Dr. R. T. Wilson, Austin, historian.

The scientific program included talks by the following guest speakers: Dr. John Caffey, Columbia University, New York; Dr. Manuel Garcia, Tulane University, New Orleans; Dr. Harold O. Peterson, University of Minnesota, St. Paul; Dr. A. Justin Williams, University of California, San Francisco; and Kenneth E. Corrigan, Ph. D., Wayne University, Detroit.

Other participants in the program were Dr. Milton V. Davis, Dallas; Dr. Alvin Thaggard, San Antonio; Dr. A. K. Doss, Fort Worth; Dr. Palmer Wigby, Houston; and Dr. J. E. Miller, Dallas.

Presiding over various sessions were Dr. B. K. Lovell, McKinney; Dr. Delphin Von Briesen, El Paso; Dr. John J. Sazama, Jr., Dallas; and Dr. Otto H. Grunow, Fort Worth.

A tea and luncheon were provided for the ladies. Luncheons and a cocktail party and banquet also were held.

BASIC SURGERY TO BE REVIEWED

A postgraduate course in basic principles of surgery will be offered by the Southwestern Medical School of the University of Texas in Dallas, April 22, 23, and 24. Originally announced for April 19-21, the course will be given at Scottish Rite Hospital. Tuition and registration fee will be $25. A detailed program may be obtained from Dr. John S. Chapman, assistant dean for graduate and postgraduate education at the medical school, 2211 Oak Lawn Avenue, Dallas 19.

Medical Technologists to Meet

The annual meeting of the Texas Society of Medical Technologists will be held April 23 and 24 in El Paso, Miss Wanda Moskalski, El Paso, publicity chairman, announces.

The American Society of Medical Technologists will meet June 13-17 in Miami Beach, Fla., with headquarters at the Delano and DiLido Hotels, Mesdames Maxine T. Ace and Anna L. Rundell, Miami, co-chairmen of the publicity committee, report.

Television's March of Medicine Resumes

Three spring programs in the "March of Medicine" series televised over the National Broadcasting Company's network have been announced for March 11, April 29, and June 24. Sponsored by Smith, Kline and French Laboratories in cooperation with the American Medical Association, the new series will touch on overweight and arthritis in the first two programs; the third will originate from the AMA's annual session in San Francisco, the subject to be announced.

American Goiter Association to Meet

The American Goiter Association will meet in Boston, April 29-May 1 for a program of papers and discussions on the physiology and diseases of the thyroid gland. Further information may be obtained from Dr. John C. McClintock, corresponding and recording secretary of the association, 149½ Washington Avenue, Albany, N. Y.

LIBRARY SECTION

SUMMARY OF SERVICE, 1953

The staff of the Memorial Library of the Texas Medical Association takes pleasure in presenting a summary of the use of the Library for 1953. It is hoped the Library facilities will be used by even more members in 1954.

Material is mailed prepaid to members; it is no longer necessary to refund this postage. The only expense is the cost of return postage.

In each issue of the JOURNAL have been acknowledgments of gifts received from members and friends of the Association, but the many libraries which have aided in completing the journal and index files have not been listed heretofore. To the Library of the Medical and Chirurgical Faculty of the State of Maryland, Tulane University School of Medicine Library, Southwestern Medical School Library, and the Mayo Clinic Library special gratitude is due. They have done their best to answer a constant cry for back issues.

The Film Library has improved its service, and it is hoped that with the purchase of more new films all requests can be supplied. Changes in the postal regulations made it possible to take advantage of a lower shipping rate, so that films are now being sent to members prepaid. Thus the only expense to borrowers is the return shipping cost.

The Library staff will endeavor to supply every request to the best of its ability and resources. This Library belongs to members of the Texas Medical Association, and it is being built around their needs. If any member has not used the Library and is in need of material on any medical subject, he is urged to try his own Memorial Library.

Yorke, Edward T.: *Salt and the Heart,* Linden, N. J., Drapkin, 1953.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Ciba Pharmaceutical Products, Inc.: Three books from the series "Colloquia on Endocrinology"—vol. 5, Bioassay of Anterior Pituitary and Adrenocortical Hormones; vol. 6, Hormonal Factors in Carbohydrate Metabolism; and vol 7, Synthesis and Metabolism of Adrenocortical Steroids.

Dr. Wylie F. Creel, Austin: 175 journals.

Dr. Walter D. Roberts, Austin, 15 journals.

Mr. L. C. Scheh, Seguin, 2 journals.

Dr. N. L. Schiller, Austin, 13 journals.

Dr. Earl L. Yeakel, Austin, 26 journals.

MOTION PICTURES AVAILABLE FOR LOAN

Once Upon a Time

16 mm., sound, color, 10 minutes.

This amusing, animated cartoon was designed especially for children, although it is entertaining to all ages. The film was designed to teach traffic safety to children utilizing various Mother Goose characters to prove its point. This film is excellent for children's groups, but is also useful for adults.

A Stitch in Time

16 mm., sound, 25 minutes.

Designed to make the American farm a safer place at which to work and live, this film brings out vividly the peacefulness and beauty of the countryside, and then awakens one to the many hazards that are lurking unseen in

all this serenity. The picture stresses the importance of self-protection through education and preventive methods. Farmers are not more careless than other people, but from pioneer days they learned to be fearless and courageous, and perhaps take more chances that easily could be avoided.

This film is highly recommended for all rural groups. Physicians practicing in rural areas will find it helpful in presenting programs to lay groups.

Vitamin A in Human Nutrition

16 mm., sound, 34 minutes. (Courtesy of Mead Johnson and Company, Evansville, Ind.)

This film presents the history of the discovery of vitamin A, and includes the techniques for detection of the vitamin A status within the body. The film also presents the part played by this vitamin in the life and well-being of infants and children. This motion picture should be of interest to general practitioners and pediatricians.

Proof of the Pudding

16 mm., sound, color, 10 minutes. (Courtesy of Metropolitan Life Insurance Company, New York.)

The essentials of good nutrition and its relation to health are presented. Excellent animated scenes are interspersed to amplify the explanation.

This film is excellent for all lay groups, from elementary school age to adult. It is frequently used in nursing schools.

Appraisal of the Newborn

16 mm., sound. 20 minutes. (Courtesy of Mead Johnson and Company, Evansville, Ind.)

This picture shows the importance of family history, prenatal history, natal history, and postnatal history as valuable preventive measures and to supply information for future reference in helping make the day old infant into a normal and healthy person. This is an excellent film for all medical groups.

BOOK NOTICES

[1]Surgical Pathology

LAUREN V. ACKERMAN, M. D., *Professor of Surgical Pathology and Pathology, Washington University School of Medicine; Surgical Pathologist, Barnes Affiliated Hospitals, St. Louis; Consultant to Armed Forces Institute of Pathology. 836 pages. $14.50. St. Louis, C. V. Mosby, 1953.*

This is a beautifully illustrated treatise covering the broad field of surgical pathology. Particular emphasis is placed on the gross appearance of various lesions, and an attempt is made to correlate the pathologic findings with the clinical observations.

The book obviously represents compilation of a tremendous amount of material by a capable man of wide and varied experience and will be a valuable addition to the library not only of the surgeon and pathologist but also of the general practitioner and medical student. It is felt, however, that the book probably will be of more value to the surgeon and general practitioner than to the pathologist as more emphasis is placed on the gross identification of lesions than on the fine points of histologic interpretation. Although the material is ably and thoroughly presented from both the clinical and pathologic standpoints, the style of presentation is perhaps somewhat less lucid than one would expect. It is particularly stimulating, however, to note that this book apparently represents a meticulous compilation of the author's own experience in surgical pathology rather than a review of old and time-honored concepts of the many lesions encountered in the fields of pathology and surgery.

[1]*C. D. Fitzwilliams, M. D., Fort Worth.*

[2]Practical X-Ray Treatment

ARTHUR W. ERSKINE, M. D., *Fourth edition, 195 pages. $5. Saint Paul, Minn., Bruce Publishing Company, 1953.*

This 195 page book is the fourth edition under this title. The first edition was published in 1931. The author planned to report briefly, simply, and clearly what he did in the practice of radiology. He recognized the perplexing, changing, and unsolved problems of x-ray therapy. His plan was attained.

Illustrations and tables are freely interspersed throughout the book, a format which aids appreciably in the brevity of the book. There is a generous bibliography.

About half of the book is devoted to the history of x-ray, apparatus, protection, measuring instruments, factors affecting skin and depth dose, filters and other physical factors, and effects of x-rays on tissues.

The chapter devoted to treatment of skin diseases calls attention to the fact that some eighty different diseases of the skin benefit from x-ray therapy but only a small group is briefly and separately discussed. One recognized the author's practical viewpoint that radiologists must exercise some knowledge of general medicine to be the best consultants. The group of diseases considered in this section is most prevalent in the practice of radiology not limited to hospital work.

Two brief chapters are devoted to treatment of infections, inflammations, and nonmalignant conditions. These consist of frank expressions concerning the desirability and limitations of and technique for treating these conditions.

There is a brief discussion of "the cancer problem and the radiologist," showing the importance of that specialist in the prevention, educational program, and treatment of malignancies.

The section devoted to treatment of malignancies is limited to this important problem, but the author gives his frank opinions gathered from many years of experience. He recognizes variations in techniques and possible approach. One can only appreciate his attitude since his wide experience shows the progress made toward success in this difficult problem.

This book was not compiled for the "expert therapist," but it is valuable to any young physician and will serve as a review for any roentgenologist in practical x-ray treatment.

[2]*A. G. Barsh, M. D., Lubbock.*

[3]An Atlas of Surgical Exposures of the Extremities

SAM W. BANKS, M. D., *Associate Professor of Orthopaedic Surgery, Northwestern University Medical School; Attending Orthopaedic Surgeon, Chicago Memorial Hospital and Woodlawn Hospital; and* HAROLD LAUFMAN, M. D., Ph. D., *Associate Professor of Surgery and Director of Experimental Surgery, Northwestern University Medical School; Associate Attending Surgeon, Michael Reese Hospital. 391 pages. $15. Philadelphia, W. B. Saunders, 1953.*

All too frequently in medical literature an operative procedure is described without adequate consideration being given to the surgical approach. In many instances the exposure is the most difficult part of the operation and, unless carried out properly, may result in prolonged operating time and unnecessary trauma.

This book presents the technique of surgical exposures of bones, joints, and nerves of the extremities. Often several approaches to the same area are described. Each procedure is

[3]*F. C. Lowry, M. D., Austin.*

outlined step by step, both by written text and by drawings. Indications for each exposure are given, as well as special notes regarding the avoidance of damage to nearby nerves and vessels. The descriptions are clear and concise. The drawings are excellent; 552 illustrations are used to portray 143 exposures.

This atlas will be a valuable addition to the library of every surgeon who operates on the extremities. It will be useful to the student, the intern, and the resident in general surgery or orthopedic surgery.

May's Manual of the Diseases of the Eye

Edited by CHARLES A. PERERA, M. D., *Associate Clinical Professor, College of Physicians and Surgeons, Columbia University, New York; Attending Ophthalmologist, Presbyterian Hospital, New York. Twenty-first edition, 512 pages, $6. Baltimore, Williams and Wilkins, 1953.*

Written primarily for medical students and general practitioners, this text first appeared in print in 1900. Dr. Perera has skillfully brought this twenty-first edition up to date without increasing its size.

[4]Injuries of the Spinal Cord

Edited by GEORGE C. PRATHER, M. D., F.A.C.S. *and* FRANK H. MAYFIELD, M. D., F.A.C.S., *396 pages, $8.75. Springfield, Ill., Charles C Thomas, 1953.*

One cannot escape the conclusion that "Injuries of the Spinal Cord" is a reissue of George C. Prather's monograph published in 1949 by the same publisher. Actually, another title might have been "The Urological Aspects of Spinal Cord Injuries, With Some Timely Remarks on the Neurosurgical, Nutritional, and Rehabilitation Aspects." Such a title, however, might be misleading, though essentially accurate. Frank Mayfield has written a dandy synopsis, which is concise and practical. The same may be said of the chapters on nutrition, rehabilitation, treatment of decubitus ulcers, orthopedic problems, psychologic considerations, and associated injuries.

One would be trite to say the authors are familiar with the subject. Actually, they are intimate with it. This intimacy makes for the marshalling of pertinent facts in a small volume.

Hospital libraries everywhere should own this small volume. Injuries of the spinal cord demand immediate attention. A surgeon remote from a neurosurgeon could obtain a good working notion of the immediate care of his patient from this volume. In fact, he might be able to read it through while waiting for a consultant to finish his golf game.

The page size is 9 by 6 inches. The 125 illustrations are well chosen and well reproduced.

[5]Atlas of Medical Mycology

EMMA SADLER MOSS, M. D., *Director, Department of Pathology, Charity Hospital of Louisiana at New Orleans; Clinical Professor of Pathology, Louisiana State University School of Medicine; and* ALBERT LOUIS MCQUOWN, M. D., *Pathologist, Our Lady of the Lake Sanitarium, Baton Rouge; Clinical Assistant Professor of Pathology, Louisiana State University School of Medicine. 245 pages, $8. Baltimore, Williams and Wilkins, 1953.*

The field of medical mycology is much in need of an adequate atlas for reference and teaching. This book answers this need only in part. There is a good quantity of illustrations, and the quality of most is good-to-excellent; however, there are some that are not satisfactorily clear.

The arrangement of the illustrations is fairly consistent and orderly for the most part. This statement is not true, however, for the dermatomycoses; here the illustrations are not at all orderly so that one may skip about over many pages to run down the description of a given organism.

Editing of the book has left considerable to be desired. "Intercalary" and "racquet" (mycelium) are regularly misspelled "intercallary" and "raquet." Species names derived from proper nouns are capitalized, which is not usual custom, and the index is not adequate. For example T. metagrophytes is indexed as appearing on two pages; this reviewer found illustrations and references to this organism on nine different pages.

The text is brief and appears to be a summary of what is found in standard textbooks; obviously it is intended only for orientation and not for clinical guidance, as is customary in atlases. The bibliography is extremely short, and there are no cross referrals between it and the material in the book itself.

On the whole, this appears to be a book of limited usefulness, with many interesting illustrations, some of them of outstanding quality. The book, however, does not bear out the implied suggestion in its preface that it could be used as a manual of determinative mycology.

Textbook of Public Health (Formerly Hope and Stallybrass)

W. M. FRAZER, O.B.E., N. D., Ch. B., M. Sc., D.P.H., *Barrister-at-Law, Gray's Inn; Medical Officer of Health, City and Port of Liverpool, and Medical Officer to the Liverpool Education Committee; Professor of Public Health, University of Liverpool. Thirteenth edition. 663 pages. $8.50. E. & S. Livingstone, Edinburgh and London, 1953. Distributed by Williams and Wilkins, Baltimore.*

The thirteenth edition of the standard British textbook on public health has been thoroughly revised and the many changes in the public health laws have been included. The chapter on public health administration gives a breakdown on the functions of each department and a brief history of each. Chapter 24, "The Social Services," a brief history leading up to the National Assistance Act of 1948, is followed by the act and explanations of the duties of the local authorities under the law.

Many leading authorities in the field of public health have cooperated to make this publication outstanding in its field. It is well written and should be used by public health officers regardless of their location. The illustrations, floor plans for clinics, maps, and charts are worthy of mention. There is an extensive index.

From the Workshop of Discoveries

OTTO LOEWI, *Research Professor of Pharmacology, New York University College of Medicine. Porter Lectures, Series 19. 62 pages. $2. Lawrence, University of Kansas Press, 1953.*

There are three lectures in this series: "Reflections in the Study of Medicine," "From the Workshop of Discoveries," and "Problems in the Field of Adrenal Function."

The study and practice of medicine are discussed from a broad point of view. To study and to hold fast to all that is good and to reach beyond your grasp are just two of the many philosophical ideas that are presented.

Three categories of discoveries are discussed—discoveries made by chance, those made by intention, and those made by intuition. Each method is discussed and examples are given.

The last lecture is the presentation of recent studies on adrenal function.

ORGANIZATION SECTION

Announcements and Program of the EIGHTY-SEVENTH ANNUAL SESSION of the TEXAS MEDICAL ASSOCIATION

San Antonio, Texas

ANNOUNCEMENTS

Scientific activities of the Texas Medical Association will be housed in the Municipal Auditorium. Scientific meetings of related organizations will be held in the Municipal Auditorium, Gunter Hotel, and Plaza Hotel. Specific locations will be found under announcements of specific activities.

Registration, Information, and Messages

On Sunday, May 2, the Registration Desk will be located on the east mezzanine floor of the Gunter Hotel. Monday through Wednesday, May 3-5, registration will be in the foyer of the Municipal Auditorium. Members, medical visitors, and guests should register immediately upon arriving in the city and obtain badges and programs.

Badges will be required for attendance at any meeting or for admission to the exhibit area.

Information may be obtained from the ticket seller near the Registration Desk or from one of the Message Centers, at which messages for physicians will be accepted and telephones will be maintained for use by physicians. The Message Centers will be as follows:

Gunter Message Center (May 1-5), Blue Bonnet Room, third floor, telephone Fannin 3111.

Auditorium Message Center (May 3-5), west end of lower level, telephone Fannin 7396.

Plaza Message Center (May 2-3), lobby, telephone Garfield 2134.

All mail and telegrams should be addressed in care of the Texas Medical Association, Gunter Hotel, during the period of the annual session.

Woman's Auxiliary

The Woman's Auxiliary will have its headquarters at the Menger Hotel, where courtesy and information committees from the Woman's Auxiliary to the Bexar County Medical Society will be on duty. All women in attendance at the annual session should register at the Auxiliary Registration Bureau in the Gay Nineties Lounge immediately upon arriving in the city.

Hotel Information

Those who attend the annual session should obtain room reservations from the hotel of their choice. Additional hotel information may be secured from Dr. John M. Smith, Jr., chairman of the Hotels Committee, who may be reached through the San Antonio Medical Exchange, Garfield 6331.

A list of hotels and motels, their addresses, total rooms, and minimum charges follows:

HOTELS

Bluebonnet, 426 N. St. Mary's, 250 rooms, $3.
Crockett, 301 E. Crockett, 150 rooms, $3.
Gunter, 205 E. Houston, 550 rooms, $5 (Association officials).
Menger, 204 Alamo Plaza, 130 rooms, $5.50 (Auxiliary officials).
Plaza, 309 S. St. Mary's, 500 rooms, $5 (technical exhibitors).
Robert E. Lee, 311 W. Travis, 250 rooms, $3.50.
St. Anthony, 300 E. Travis, 250 rooms, $5.
White Plaza, 203 E. Travis, 204 rooms, $3.25 (Association officials).

MOTELS

Aero Motel, 3535 Broadway, 24 units, $5.
Casa Linda Motel, 3215 Broadway, 36 units, $6.
El Montan Motor Courts, 6806 San Pedro, 23 units, $6.
Park Mo-Tel, Inc., 3617 Broadway, 52 units, $4.
Ranch Motel, 3101 Broadway, 27 units, $5.
Rio Lado Drive In Hotel, 1100 N. St. Mary's, 30 rooms, $6.
Siesta Motor Courts, 4341 Fredericksburg Road, 36 units, $4.50.
The Westerner, 1116 Austin Highway, 85 rooms, $5.

Press Room

A Press Room will be maintained in Room 450 of the Gunter Hotel throughout the annual session. The telephone number will be Garfield 1663.

Stenographers

A Stenographers Room will be set up in the Alamo Room, third floor of the Gunter Hotel. Stenographers will be furnished upon request at the Gunter Message Center in the Blue Bonnet Room.

House of Delegates

The House of Delegates will meet in the North Terrace,

mezzanine floor, Gunter Hotel. The first session will be held Sunday, May 2, at 9:00 a. m. (p. 187).

Reference Committees

Reference committees will hold their first meetings at 2:00 p. m., Sunday, May 2, at the locations specified below. Additional meetings will be at such other times as the chairmen of the committees may find necessary. All meeting places other than for Sunday afternoon will be assigned at the Gunter Message Center in the Blue Bonnet Room, and the assignments will be posted there. Committee chairmen are urged to inform the Message Center staff when they have called meetings so that inquirers can be directed properly.

Stenographers will be furnished upon request at the Gunter Message Center.

Any member of the Association may arrange with a reference committee for appearance in opposition to or defense of reports submitted to the House of Delegates.

Meetings of reference committees Sunday afternoon will be held in the Gunter Hotel as follows:

Reports of Officers and Committees—Room 461.

Resolutions and Memorials—North Terrace, mezzanine floor.

Finance—Room 463.

Amendments to Constitution and By-Laws—Texas Room, third floor.

Scientific Work—Cactus Room, third floor.

Medical Service and Public Relations—Mezzanine C.

Board of Councilors—Room 462.

Board of Trustees—Room 1026.

Opening Exercises

The Opening Exercises will be held in Room A, Municipal Auditorium, at 8:45 a. m., Monday, May 3 (p. 175).

Memorial Services

The Memorial Services will be held in conjunction with the Opening Exercises in Room A, Municipal Auditorium, at 8:45 a. m., Monday, May 3 (p. 175).

President's Party with Buffet

The party honoring the President will be a buffet supper followed by entertainment with a Spanish flavor—all with the charm and atmosphere of "A Night in Old San Antonio." This gay evening will take place Tuesday, May 4, at La Villita, corner of South Presa and Villita Streets. The buffet will be served from 7:30 to 9:30 p. m., and the entertainment will be given thereafter. Eddie Martinez and his company of 18 performers will appear in twelve different numbers, with Rosita, San Antonio's well-known Spanish TV songstress, as one of the featured players. From 10:30 p. m. until 12:00 midnight the orchestra will play for dancing.

All members of the Association, Woman's Auxiliary, guests, and visitors are invited. Tickets at $6 each will be on sale near the Registration Desk until 2:00 p. m. the afternoon of the party. No refunds will be made after 12:00 noon. Tickets will be required for supper, but those who come at 9:30 p. m. for the entertainment only will not need tickets. Dress will be informal or cocktail.

In case of rain the party will be held in the Ballroom of the Plaza Hotel.

General Meeting Luncheon

The General Meeting Luncheon will be held Wednesday, May 5, at 12:30 p. m. in the Grand Ballroom, mezzanine floor, Gunter Hotel. Members of the Association and Woman's Auxiliary, guests, and visitors are invited. Tickets at $2 each will be on sale near the Registration Desk until 10:00 a. m. of the day of the luncheon. No refunds will be made after 9:00 a. m. that morning. Tickets will be required for admittance to the luncheon.

Alumni Banquets

Alumni banquets will be held beginning at 6:00 p. m., Monday, May 3. Tickets will be on sale Sunday, May 2, on the east mezzanine floor of the Gunter Hotel and Monday, May 3, in the foyer of the Municipal Auditorium. Dr. William D. Montgomery is general chairman.

The following banquets have been arranged:

The University of Texas Medical Branch, Colonial Room, Menger Hotel. Cocktails at 6:30 p. m. will precede a 7:30 p. m. dinner. Separate tickets for cocktails and the dinner will be on sale. Reservations can be made ahead of time by writing to the Alumni Association, Galveston. Dr. G. G. Passmore, chairman.

Baylor University College of Medicine, North Terrace, Gunter Hotel, Dr. C. C. Shotts, chairman.

Southwestern Medical School, Grand Ballroom Foyer, Gunter Hotel, Dr. J. Walter Park, III, chairman.

Tulane University, Cos House, 503 Villita Street, Dr. James E. Pridgen, chairman.

University of Arkansas, Cactus Room, Gunter Hotel, Dr. William M. Center, chairman.

Louisiana State University, Texas Room, Gunter Hotel, Dr. Mildred E. Ward, chairman.

University of Tennessee and Vanderbilt University, South Terrace, Gunter Hotel, Dr. Thomas H. Diseker, chairman.

Fraternity Parties

Fraternity parties will be held from 6:30 to 8:00 p. m., Tuesday, May 4. Tickets will be on sale Sunday, May 2, on the east mezzanine floor of the Gunter Hotel and Monday, May 3, in the foyer of the Municipal Auditorium. Dr. William J. Johnson, Jr., is general chairman.

The following parties have been arranged:

Alpha Kappa Kappa, Parlor A, Plaza Hotel, Dr. Edwin M. Sykes, Jr., chairman.

Nu Sigma Nu, Walnut Room, Plaza Hotel, Dr. Hugh P. Reveley, chairman.

Phi Beta Pi, Roof Garden, Plaza Hotel, Dr. S. Perry Post, Jr., chairman.

Phi Chi, Fiesta House, La Villita, Dr. James L. Mims, Jr., chairman.

Phi Delta Epsilon, Parlor B, Plaza Hotel, Dr. R. Bernard Pomerantz, chairman.

Phi Rho Sigma, Cos House, La Villita, Dr. John L. Matthews, chairman.

Theta Kappa Psi, Florian House, La Villita, Dr. William J. Fetzer, chairman.

Council on Scientific Work

A Council on Scientific Work breakfast for members of the council and section officers for the 1954 and 1955 annual sessions will be held in the Texas Room, Gunter Hotel, at 7:00 a. m. Tuesday, May 4, with the Texas Medical Association as host. A breakfast for the council and section secretaries for the 1954 and 1955 sessions will be held Wednesday, May 5, at the same hour and place.

Delegates to American Medical Association

A breakfast for delegates and alternate delegates to the American Medical Association will be held at 7:30 a. m., Sunday, May 2, in the Texas Room of the Gunter Hotel.

Past Presidents' Association

The annual Past Presidents' Association luncheon will be held in Mezzanine C, Gunter Hotel, at 12:00 noon, Monday, May 3. Dr. L. H. Reeves, Fort Worth, secretary of the association, is in charge of arrangements.

Fifty Year Club

The Fifty Year Club for physicians who have been in medical practice at least fifty years will meet for breakfast at 7:30 a. m., Tuesday, May 4, in Mezzanine B, Gunter Hotel. Dr. L. H. Reeves, Fort Worth, is in charge of arrangements.

Society of Life Insurance Medical Directors

The Society of Life Insurance Medical Directors of Texas will have a luncheon Tuesday, May 4, at 12:00 noon in the Texas Room of the Gunter Hotel. Dr. C. Frank Brown, Dallas, secretary, is making the arrangements.

Texas Geriatrics Society

A meeting to organize a Texas Geriatrics Society will be held at 8:00 p. m., Monday, May 3, in the Oriental Room of the Gunter Hotel. Interested members of the Texas Medical Association are invited. Arrangements are in charge of Dr. Henry H. Niehuss, Longview.

History of Texas Medical Association

"A History of the Texas Medical Association, 1853-1953" by Dr. P. I. Nixon, published by the University of Texas Press in cooperation with the Association in celebration of the centennial of the Association, will be on display and for sale on the east mezzanine floor of the Gunter Hotel, Sunday, May 2, and in the lower level of the Municipal Auditorium Monday through Wednesday, May 3-5.

Golf

The Texas Medical Association Golf Tournament will be held Monday, May 3, at 1:00 p. m. at the San Antonio Country Club. Further information may be obtained from the chairman of the Golf Committee, Dr. John B. Case, 625 Medical Arts Building. Prizes will be awarded.

GEORGE TURNER, M. D., El Paso.
Eighty-Eighth President, Texas Medical Association.

MRS. EDWARD W. COYLE, San Antonio.
President, Woman's Auxiliary to the Texas Medical Association.

F. J. L. BLASINGAME, M. D., Wharton.
President-Elect, Texas Medical Association.

MRS. MARK H. LATIMER, Houston.
President-Elect, Woman's Auxiliary to the Texas Medical Association.

GUEST SPEAKERS

SIMEON T. CANTRIL, M. D., F.A.C.R., Seattle, Wash.
Director, Tumor Institute of the Swedish Hospital; Associate Professor of Radiology, University of Washington School of Medicine; Consultant in Radiation Therapy, Veterans Administration and United States Public Health Service Hospitals; Regional Consultant, Atomic Energy Commission.

GEORGE T. HARRELL, JR., M. D., F.A.C.P., Gainesville, Fla.
Professor of Medicine and Dean, University of Florida College of Medicine.

HAROLD D. PALMER, M. D., F.A.C.P., F.C.A.P., Denver, Colo.
Pathologist and Medical Director, Children's Hospital of Denver; Associate Professor of Pathology, University of Colorado School of Medicine and Graduate College.

WILLIAM ALAN RICHARDSON, Rutherford, N. J.
Editor, *Medical Economics.*

ROBERT L. SANDERS, M. D., LL.D., F.A.C.S., Memphis, Tenn.
Senior Surgeon, Baptist Memorial Hospital; Professor of Surgery (inactive), University of Tennessee College of Medicine.

E. STEWART TAYLOR, M. D.,
Denver, Colo.
Professor and Head of Department of Obstetrics, University of Colorado School of Medicine.

OPENING EXERCISES, MEMORIAL SERVICES, AND GENERAL MEETING

Monday, May 3

8:45 a. m. to 9:40 a. m.

Room A, Municipal Auditorium

GEORGE TURNER, El Paso, President, Presiding

1. (8:45) *Prayer.*
THE REV. GEORGE MAUZE, D.D., Pastor, First Presbyterian Church, San Antonio.
2. (8:50) *"Twenty-Third Psalm" (Malotte).*
MR. MORRIS WHITEHEAD, San Antonio.
3. (8:55) *Memorial Address for Deceased Members of Woman's Auxiliary.*
MRS. G. V. BRINDLEY, Temple.
4. (9:00) *Memorial Address for Deceased Physicians: In Memoriam.*
THE REV. E. J. GREGORY, Superintendent, Mexican Baptist Orphans Home of Texas, San Antonio.
5. (9:05) *Introductions.*
F. J. L. Blasingame, Wharton, President-Elect, Texas Medical Association.
Mrs. Mark H. Latimer, Houston, President-Elect, Woman's Auxiliary to the Texas Medical Association.
Merton M. Minter, San Antonio, President, Bexar County Medical Society.
Mrs. John C. Parsons, San Antonio, President, Woman's Auxiliary to Bexar County Medical Society.
Mrs. Leo J. Schaefer, Salina, Kan., President, Woman's Auxiliary to American Medical Association.
Mrs. George D. Feldner, New Orleans, La., President, Woman's Auxiliary to Southern Medical Association.
L. Bonham Jones, San Antonio, Chairman, Committee on General Arrangements for Annual Session.
B. F. Stout, San Antonio, Chairman, Committee on Memorial Services.
6. (9:10) *Address of Auxiliary President.*
MRS. EDWARD W. COYLE, San Antonio.
7. (9:20) *Address of President.* GEORGE TURNER, El Paso.

EXPECTING A GOOD TIME?

Make Hotel Reservations Now,

Then Buy Tickets for Social Functions Immediately upon Arrival in San Antonio

Plan to Stay for the Full Session

SECTION A (MEDICAL)

General Practice, Internal Medicine, Public Health, Clinical Pathology, Pediatrics

Chairman—John R. Winston, Temple.

Co-Chairman—Richard E. Nitschke, San Antonio.

Secretary—Robert A. Gardner, Houston.

TUESDAY, MAY 4

Room A, Municipal Auditorium

8:00 a. m. to 8:30 a. m.

1. *Motion Picture: Congenital Malformations of the Heart; Cyanotic Congenital Heart Disease* (University of Washington, Seattle).

8:30 a. m. to 10:00 a. m.

John R. Winston, Temple, Presiding

2. (8:30) *Clinical Evaluation and Management of Liver Diseases.* RICHARD D. HAINES and J. A. COLEMAN, JR., Temple.

This is a review of the pertinent disturbed mechanisms in hepatic insufficiency, including carbohydrate, protein, and vitamin metabolism; altered hormonal balance; and salt and water derangements. Current concepts of treatment relative to these disturbed functions are stressed including value of diet (salt restricted), lipotropic substances, hormones, liver extract, diuretics, and resins.

3. (8:50) *Clinical Evaluation and Management of the Painful Joint.* HOWARD COGGESHALL, Dallas.

The following topics are discussed: (1) Diagnostic consideration of joint pain. (2) Monarticular pain caused by traumatic lesions, neoplastic disease, degenerative joint disease, septic joint disease, neuropathic joint disease, and rheumatoid arthritis. Then comes a consideration of the most common joint involvement and recent developments in therapy such as injections of hydrocortisone into joints and Benamid or Butazolidine for gout.

4. (9:10) *Clinical Evaluation and Management of Metabolic Bone Diseases.*
MAVIS P. KELSEY, Houston.

Rare metabolic bone diseases are mentioned mainly for diagnostic exclusion while the everyday problems of bone disease are emphasized. Osteoporosis is extremely common postmenopause and during senility and shows therapeutic response to estrogens and androgens. Parathyroid adenoma should be excluded in every case of renal stones and should be diagnosed long before serious renal or bone damage occurs. Diagnostic features of Paget's disease, fibrous dysplasia, myeloma, and widespread malignancy are discussed.

5. (9:30) *Clinical Evaluation of I^{131} as a Diagnostic and Therapeutic Agent.* RALPH CLAYTON, Dallas.

The properties of radioactive iodine (I^{131}) which make it valuable in clinical medicine are reviewed briefly. Because its greatest use is in the diagnosis and treatment of thyroid diseases, the major portion of the discussion concerns its current value in this field. Other practical uses of I^{131} in everyday practice are mentioned in broad principle. Detailed theory is omitted.

6. (9:50) *Questions and Answers.*

10:00 a. m. to 10:30 a. m.

7. *Recess to Visit Exhibits.*

10:30 a. m. to 12:00 noon

A. J. Gill, Dallas, Presiding

8. *Announcement of Scientific Exhibit Awards.*

9. (10:30) *Symposium: Problems in Blood Transfusion.*
a. (10:30) *Relationship of the Physician to the Problems of Blood Banking.*
JARRETT E. WILLIAMS, Abilene.

As blood transfusion therapy became safer and more popular, the physician began to relinquish the technical aspects to medical technologists or special physicians. With the advent of blood banks the physician began to order blood without acquainting the patient with the necessity of replacing the blood. The loss of the physician-patient relationship in blood procurement and transfusion may take blood banking entirely away from the medical profession with which it appears properly to belong. This is an appeal to maintain this relationship that patients and public may be better protected.

b. (10:50) *Modern Techniques in Crossmatching.*
O. J. WOLLENMAN, JR., Fort Worth.

Included is discussion of the accepted methods of crossmatching, possible errors in procedures, and interpretation of results. Special emphasis is placed on accurate identification of recipient, ideal technical methods of crossmatching, other factors producing agglutination, and the keeping of adequate records.

c. (11:10) *Minor Incompatibilities of Blood Transfusions.*
E. E. MUIRHEAD, Dallas.

Incompatible blood transfusions result from an increased rate of destruction of red blood cells due to the action of antibodies. This report enlarges on the various aspects of incompatible transfusions with emphasis on identification and differential diagnosis of minor incompatible blood transfusions.

10. (11:30) *What Makes the Doctor-Patient Relationship Tick.* WILLIAM ALAN RICHARDSON, Rutherford, N. J.

12:00 noon to 1:30 p. m.

11. *Recess for Luncheon.*

1:30 p. m. to 2:00 p. m.

12. *Motion Picture: Steps of Age* (International Film Bureau, Chicago).

The problems of old age from a social, economic, and psychologic standpoint are considered.

2:00 p. m. to 3:30 p. m.

Maurice A. Roe, Dallas, and Austin E. Hill, Houston, Presiding

13. (2:00) *Symposium: Geriatrics.*
a. (2:00) *Medical Care and Social and Economic Problems of the Aged.*
O. M. PHILLIPS, Fort Worth.

The life span has been increased, and the percentage of older people is growing. Because of this, we are faced with many problems. Facilities for proper care of the aged are inadequate, from both a social and an economic standpoint. Many states, communities, and private enterprise are becoming more aware of the situation. One particular project for the aged is discussed.

b. (2:20) *Public Health Aspects of the Aging Population.*
MAURICE A. ROE, Dallas.

Important public health problems affecting the aged are discussed with special reference to abnormal conditions or diseases considered preventable or controllable, particularly through programs of public agencies. Special emphasis is given on home accidents, diabetes, tuberculosis, venereal disease, cancer, obesity, nutritional disorders, anemias, and cardiovascular conditions to stress the importance of their recognition as well as prevention.

c. (2:40) *Modern Concepts of Physiologic Changes with Old Age.*
ROBERT A. HETTIG, Houston.

d. (3:00) *Psychiatric Aspects in Care of the Aged.*
MELBOURNE J. COOPER, San Antonio.

Care of the aged in the home requires careful attention to psychiatric needs. In addition to physical necessities, such as good diet, hygiene, and rest, the person's health and happiness demand emotional satisfactions. Such emotional necessities include a stabilized home environment; identification with both a home and a social group; an attitude of affection, respect, and tolerance on the part of others; and a planned program of work and recreation suitable to the person's capacities.

14. (3:20) *Questions and Answers.*

3:30 p. m. to 4:00 p. m.

15. *Recess to Visit Exhibits.*

4:00 p. m. to 5:30 p. m.

John A. Welty, Harlingen, Presiding

16. (4:00) *Changing Concepts in the Purpuric Syndrome.*
HAROLD D. PALMER, Denver, Colo.

With the development of the concept of immunohemolytic disease as applied in the various syndromes of acquired hemolytic anemia have come various laboratory methods of study which permit one to establish the presence of antibodies. These methods have been applied to purpuric diseases. This paper develops the information which leads to the conclusion that idiopathic thrombocytopenic purpura is also a manifestation of autoimmunization.

17. (4:30) *Myxedema* (motion picture).
GEORGE T. HARRELL, Gainesville, Fla.

Myxedema is a condition which is easily diagnosed clinically from the symptoms and signs. It is unfortunate that it is so frequently overlooked until irreversible damage has been done by the development of arteriosclerosis. Oral thyroid replacement therapy is easily controlled and is effective in restoring the patient to a happy and useful life. If the disease is recognized early and treatment is carefully carried out, patients with myxedema are among the most satisfying that a physician can have.

18. (5:00) *Effect of Potassium Depletion in Essential Hypertension.* ARTHUR RUSKIN, Galveston.

Potassium depletion was accomplished in 22 cases of uncomplicated essential hypertension by (1) low potassium diet, (2) oral administration of a potassium-free cation exchange resin, and (3) rare injections of mercaptomerin. The arterial pressures fell 30 mm. systolic and 20 mm. diastolic in the majority of cases, parallel to the developing hypopotassemia.

19. (5:20) *Questions and Answers.*

WEDNESDAY, MAY 5

Room A, Municipal Auditorium

8:00 a. m. to 8:30 a. m.

20. *Motion Picture: Tuberculosis of the Larynx, Tracheobronchial Tree, and Esophagus* (Holinger Memorial Fund, Chicago).

This film consists of endoscopic photographs of laryngeal, bronchial, and esophageal tuberculosis.

8:30 a. m. to 10:00 a. m.

Sheldon M. Tucker, Houston, Presiding

21. (8:30) *Symposium: Current Trends of Therapeutics.*
a. (8:30) *Bacterial Filtrates in the Treatment of Allergic Diseases.*
JACK M. ROSE, Houston.

A series of 35 patients were treated with bacterial filtrates. In all, the infectious component was of primary importance in producing manifestation of either asthma or allergic rhinitis. All had been previously treated unsuccessfully with other forms of therapy including vaccines and hyposensitization. The rationale of therapy, skin testing in bacterial hypersensitivity, and the results of treatment are discussed.

b. (8:45) *Recent Additions to the Therapy of Neurologic Conditions.*
F. KEITH BRADFORD, Houston.

Progress in the antibiotic field has continued to aid in combating infections of the central nervous system. Further experience with

older antibiotics, in many instances, has been as important as the development of new ones. Cortisone and ACTH appear promising in the treatment of polyneuritis of the Guillain-Barré type and in the treatment of early Bell's palsy, although they have failed to alter the course of multiple sclerosis and other more prevalent neurologic illnesses.

c. (9:00) *Some Complications of Antimicrobial Therapy.*
JESSE W. HOFER, Houston.

The widespread use of antimicrobial agents may have resolved many perplexing problems of infectious diseases. Yet new and more perplexing problems have been created. Among these are the untoward effects which have been increasing progressively. Some of these are directly toxic, some allergic, and some related to the biologic activities of the specific antibiotics. This discussion attempts to classify the complications of antimicrobial agents according to different organ systems.

d. (9:15) *Need for Therapeutic Skepticism.*
WILLIAM H. GORDON, Lubbock.

Osler was known as a therapeutic nihilist, yet he considered himself a therapeutic skeptic. Although many present day drugs and biologicals are marvelously effective when used properly, the practice is to treat first and diagnose later, if at all. Many of the better drugs are being prostituted to the detriment of the patient occasionally, and to the medical profession often. The author's views regarding the need for some of Osler's healthy therapeutic skepticism are presented.

22. (9:30) *Role of Radiation Therapy in the Treatment of Lymphomas.*
SIMEON T. CANTRIL, Seattle, Wash.

Radiation therapy, primarily roentgen therapy, has long been the chief agent in the treatment of lymphomas (Hodgkin's disease, lymphosarcoma, giant follicle lymphoma, and reticulum cell sarcoma). Decisions for irradiation and its course are influenced by the type of lymphoma, the presenting clinical state, and the anticipated natural course of the disease. The place of chemotherapy and radioisotopes as adjuncts to x-ray therapy is discussed. Case presentations illustrate the management of the more common clinical states.

23. *Questions and Answers.*

10:00 a. m. to 10:30 a. m.

24. *Recess to Visit Exhibits.*

10:30 a. m. to 12:00 noon

Richard E. Nitschke, San Antonio, Presiding

25. (10:30) *Panel Discussion: Cortisone, Hydrocortisone, and ACTH.*

a. (10:30) *Their Nature.*
CHARLES I. SPURR, Houston.

b. (10:42) *Uses in Rheumatoid Arthritis and Rheumatic Fever.*
W. W. BONDURANT, JR., San Antonio.

c. (10:54) *Uses in Allergic Conditions.*
WILLIAM C. GRATER, Dallas.

d. (11:06) *Uses in Hematologic and Neoplastic Diseases.*
HAROLD D. PALMER, Denver, Colo.

e. (11:18) *Complications and Contraindications.*
GEORGE T. HARRELL, Gainesville, Fla.

26. (11:30) *Questions and Answers.*

A HISTORY OF
THE TEXAS MEDICAL ASSOCIATION
1853-1953
by PAT I. NIXON, M. D., San Antonio
will be on display and for sale
Gunter Hotel, May 2—Municipal Auditorium, May 3-5

SECTION B (SURGICAL)

General Practice; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose, and Throat; Radiology

Chairman—O. W. English, Lubbock.
Secretary—Robert F. Short, Jr., Dallas.

TUESDAY, MAY 4

Room B, Municipal Auditorium

8:00 a. m. to 8:30 a. m.

1. *Motion Picture: Fractures of the Humerus* (Veterans Administration).

8:30 a. m. to 10:00 a. m.

Van D. Goodall, Clifton, Presiding

2. (8:30) *Midforceps Operations.*
E. STEWART TAYLOR, Denver, Colo.

Advances in obstetrics have brought a gradual decrease in use of the midforceps operation. It has long been recognized that forceps operations done when the vertex is at the level of the midpelvis carry a high fetal and maternal risk. Until recently cesarean section after several hours of labor was extremely dangerous, and midforceps delivery, internal version, and craniotomy were the only procedures available for delivery when spontaneous descent of the vertex to below the ischial spines failed to occur. It is the purpose of this paper to show how infrequently midforceps operations need be elected in modern obstetric practice.

3. (9:00) *The Bone Graft in Reconstructive Surgery.*
T. WILEY HODGES, Dallas.

This paper discusses the types of bone grafts employed in reparative surgery for injuries, deformities and defects; indications and contraindications for each type; and the histologic and physiologic behavior of grafts formed of cortical and of cancellous bone. Healing time to be anticipated for each major type of graft is given. Proper preparation of the graft bed is emphasized. The causes of nonunion of fractures with appropriate treatments are discussed, with remarks on proper postoperative care and protection of the grafted bone.

4. (9:20) *Better PR—The Detour Around Socialized Medicine.* WILLIAM ALAN RICHARDSON, Rutherford, N. J.

5. (9:50) *Questions and Answers.*

10:00 a. m. to 10:30 a. m.

6. *Recess to Visit Exhibits.*

10:30 a. m. to 12:00 noon

Ernest E. Anthony, Fort Worth, Presiding

7. *Announcement of Scientific Exhibit Awards.*

8. (10:30) *Panel Discussion: Acute Infections Complicating Pregnancy.*
Moderator: S. FOSTER MOORE, JR., San Antonio.
Panel: H. FRANK CONNALLY, JR., Waco; A. LOUIS DIPPEL, Houston; ROBERT P. MCDONALD, Fort Worth; WILLIAM F. MENGERT, Dallas.

9. (11:30) *Endocrine Treatment of Gynecologic Problems.*
E. STEWART TAYLOR, Denver, Colo.

10. *Questions and Answers.*

12:00 noon to 1:30 p. m.

11. *Recess for Luncheon.*

1:30 p. m. to 2:00 p. m.

12. *Motion Picture: A Bronchoscopic Clinic* (Holinger Memorial Fund, Chicago).

The case histories, roentgenograms, bronchoscopic findings, and histology of 10 patients with bronchopulmonary disease are presented.

2:00 p. m. to 3:30 p. m.

Oliver W. Suehs, Austin, Presiding

13. (2:00) *Treatment of Acute Ophthalmic Injuries.* HAL W. MAXWELL, Dallas.

Abrasions and eyes irritated by extraocular foreign bodies, after removal of the foreign matter, should have antibiotics and patching. Contusions are best treated by splinting the eye with cycloplegics. Lacerations of the lid and globe require plastic repair by an ophthalmic surgeon during the first forty-eight hours. Mild thermal burns heal quickly with patching; severe ones may require skin and conjunctival grafts. Chemical burns should be copiously lavaged with watery solution, removing foreign substances. With any eye injury, antitetanus booster injections, cycloplegics, antibiotics, cortisone, patching, and surgery should be considered.

(2:20) Discussion—
JAMES P. ADERHOLD, San Antonio.

Hal W. Maxwell, Dallas, Presiding

14. (2:30) *Management of Recent Nasal Fractures.* WILLIAM K. WRIGHT and FREDERICK R. GUILFORD, Houston.

Nasal fractures are frequently mishandled because they are overlooked or not reduced at the proper time. Proper technique in reduction and adequate care of associated injuries are important. A logical method of handling these cases and a reduction technique based on a simple classification of fractures are presented.

(2:50) Discussion—
CHARLES ENGELKING, San Angelo.

15. (3:00) *Diagnosis and Treatment of Inhalant Allergy.* DOR W. BROWN, Fredericksburg.

Slides giving a brief review of the techniques used in the diagnosis and treatment of inhalant allergy are presented. Skin titration is then explained in detail for seasonal and perennial allergens. Kodachrome slides of the physical facilities for testing and treatment and slides of the etiology of inhalant allergens including dusts, molds, and plants are shown.

16. (3:20) *Questions and Answers.*

3:30 p. m. to 4:00 p. m.

17. *Recess to Visit Exhibits.*

4:00 p. m. to 5:30 p. m.

Royal Wertz, Amarillo, Presiding

18. (4:00) *Radiation Therapy in Management of Cutaneous Hemangiomas.* SIMEON T. CANTRIL, Seattle, Wash.

Radiation is one of several methods for treatment of hemangiomas. The method should be selected for the individual case and particularly with a view to whether any treatment other than the natural tendency to spontaneous regression will be required. The discussion outlines the common forms of hemangiomas seen in more than 500 cases referred for radiation therapy. A considerable proportion received no therapy or were treated by means other than irradiation. Cases demonstrate the more common varieties requiring therapy and the varied techniques of irradiation utilized. The presentation also emphasizes the importance of extended time in taking advantage of the natural tendency to thrombosis and regression which, however, may require the stimulus of irradiation for its initiation. Indications for surgical management of hemangiomas also are discussed, and specific illustrative cases are included.

19. (4:20) *Study of the Gallbladder and the Common Duct by Oral Dye.* HERMAN C. SEHESTED, Fort Worth.

Increased density of the shadows with the newer dyes and correct stimulation of motility and timing of films allows visualization of the gallbladder and cystic and common ducts in a higb percentage of cases. The significance of the findings in organic and functional disturbances of the extrahepatic biliary system is discussed. The danger of basing a diagnosis on negative findings is pointed out. Technical procedures for increasing the positive findings are methods to increase the density of the dye in the gallbladder, variations in positioning, spot filming, and laminography.

(4:35) Discussion—
EVERETT E. SEEDORF, Temple.

20. (4:40) *Duodenal Ulceration in Children.* LESLIE L. LEMAK, JOHN E. MARTIN, and PALMER E. WIGBY, Houston.

Two cases of duodenal ulceration in 10 year old girls are presented, showing roentgen evidence of the disease. Problems of diagnosis from a roentgen standpoint are discussed briefly. A short review of the literature concerning etiology of the disease is given.

(5:00) Discussion—
ALBERT G. BARSH, Lubbock.

21. (5:05) *Appraisal of McWhirter Technique in Breast Surgery.* VINCENT P. COLLINS, Houston.

The role of radiotherapy in treatment of breast cancer bas been warmly debated. Taylor has denied its value in preventing recurrences or in prolonging survival when used in conjunction with radical mastectomy. McWhirter has questioned the usefulness of radical mastectomy and, relying on simple mastectomy and radiotherapy, has produced ten year results which appear to equal those of conventional surgery. An attempt is made to reconcile these opposing views.

(5:25) Discussion.

WEDNESDAY, MAY 5

Room B, Municipal Auditorium

8:00 a. m. to 8:30 a. m.

22. *Motion Picture: Surgical Approaches to the Sternoclavicular and Acromioclavicular Joints* (Churchill-Wexler Films, Los Angeles).

8:30 a. m. to 10:00 a. m.

O. W. English, Lubbock, Presiding

23. (8:30) *Surgery on the Aged.* JOHN V. GOODE, Dallas.

This paper discusses the physiologic changes that take place with advancing age and factors influencing a decision to operate in (1) diseases immediately dangerous to life, (2) those dangerous but not immediately so, and (3) those not dangerous but uncomfortable. Emphasis is on preoperative, operative, and postoperative treatment, with establishment of a diagnosis, general points about the operation itself, and the psychiatric side of postoperative care receiving special attention.

24. (8:50) *Benign Tumors of the Breast.* FRANK SELECMAN, Dallas.

A simple classification of benign breast tumors is presented. Etiologic factors such as bormones, nervous influences, and beredity are discussed with review of experimental and clinical studies. Age incidence, diagnosis, pathology, and treatment of the various forms of mammary dysplasia are discussed. Statistics on the relation of benign tumors to carcinoma are presented. Simple mastectomy is shown to be seldom indicated. Practical points in handling patients are presented.

25. (9:10) *Cholecystic Disease and Its Complications.* ROBERT L. SANDERS, Memphis, Tenn.

This paper deals with (1) tbe distinction between noncalculous and calculous cholecystitis and the indications for operation in eacb type; (2) the mechanism and diagnosis of acute cbolecystitis and the question of immediate or delayed operation; (3) the deleterious effects of prolonged obstruction of the ducts on the liver, pancreas, and ducts; (4) considerations involved in the choice of the operation upon the gallbladder and in the technical performance; (5) the criteria for choledochostomy; and (6) the principles and cbief points in the technique of choledochoduodenostomy.

26. (9:40) *Questions and Answers.*

10:00 a. m. to 10:30 a. m.

27. *Recess to Visit Exhibits.*

10:30 a. m. to 12:00 noon

Robert F. Short, Jr., Dallas, Presiding

28. (10:30) *Symposium: Lesions of the Upper Gastrointestinal Tract.*

a. (10:30) *Roentgen Examination of the Upper Gastrointestinal Tract.* J. E. MILLER, Dallas.

Conventional fluoroscopic and radiographic examination of the upper gastrointestinal tract is the safest and most informative study

of this system. This discussion concerns technical factors necessary to produce an adequate roentgen examination of the upper gastrointestinal tract. An attempt also is made to define the limitations of the roentgen examination of the gastrointestinal tract.

b. (10:50) *Lesions of the Esophagus.*
MILTON V. DAVIS, Dallas.

Congenital lesions including atresia of the esophagus with and without tracheoesophageal fistula, congenital strictures of the esophagus, congenitally short esophagus, and vascular ring anomalies constricting the esophagus; non-neoplastic acquired lesions, including diverticulum of the hypopharynx, foreign bodies, caustic burns, and strictures, achalasia of the esophagus, and esophagitis; and neoplastic acquired lesions including benign and malignant tumors are discussed.

c. (11:10) *Discussion of Lesions of the Upper Gastrointestinal Tract.*
ROBERT L. SANDERS, Memphis, Tenn.

29. (11:40) *Questions and Answers.*

GENERAL MEETING LUNCHEON

Wednesday, May 5

12:30 p. m. to 2:40 p. m.

Grand Ballroom, Gunter Hotel

GEORGE TURNER, El Paso, President, Presiding

1. (12:30) *Luncheon.*
2. (1:30) *Introductions.*
President-Elect, Texas Medical Association.
President-Elect, Woman's Auxiliary to Texas Medical Association.
General Practitioner of the Year.
3. (1:35) *Report of Activities of House of Delegates.*
H. O. DEATON, Fort Worth, Speaker.
4. (1:45) *Address of Incoming President: Medical Leadership.* F. J. L. BLASINGAME, Wharton.
5. (2:05) *Address.*
GUEST SPEAKER.
6. (2:35) *Presentation of Gavel and of Past Presidents' Medallion.*

EXHIBITS

SCIENTIFIC EXHIBITS

The scientific exhibits will be displayed in the lower level of the Municipal Auditorium. Awards of merit will be given for the best scientific exhibits by an individual and by an institution.

A list of exhibits follows:

BRONCHOGENIC CARCINOMA SIMULATING BENIGN PULMONARY DISEASE (Dr. G. V. Brindley, Jr., Scott and White Clinic, Temple). This exhibit contains photographs of roentgenograms and pathologic moulages.

NEW TREATMENT FOR VAGINAL AND CERVICAL LEUKORRHEA (Dr. Karl John Karnaky, Houston). Drawings of interest to physicians doing gynecology are presented.

THE IMPORTANCE OF BLOOD IN THE URINE (Dr. Michael K. O'Heeron, Dr. James R. Fish, Dr. Richard Harrison, and Dr. James Boren, Houston). Mounted pictures, charts, printed material, and photographs describe the importance of hematuria.

TUMORS OF INFANTS AND CHILDREN (Dr. Luke W. Able, Houston). This is a display of photographs of various tumors, both in situ and excised, preoperative and postoperative, and diagnostic aids and treatment.

DIAGNOSIS AND TREATMENT OF LEPROSY (United States Public Health Service Hospital, Carville, La.; Texas State Department of Health; Dr. Fred C. Kluth, Corpus Christi). This exhibit gives diagnostic points, procedures, and clinical and statistical observation on various types of treatment.

VALUE OF SCALENE NODE BIOPSY (Dr. Lawrence M. Shefts, San Antonio). This display shows a number of roentgenograms, drawings, and statistical tables demonstrating the value of scalene node biopsy.

MUSCLE TRANSPOSITION IN POST-POLIOMYELITIC FOOT (Dr. Richard DeYoung, Houston). Photographs deal with indications, procedures, and results of muscle transposition.

SURGICAL CORRECTION OF CONGENITAL ANOMALIES (Dr. T. G. Blocker, Jr., Dr. Stephen R. Lewis, and Dr. C. C. Snyder, Galveston). This display depicts preoperative and postoperative congenital anomalies such as absence of the vagina, loss of anal sphincter, cysts, sinuses, hemangiomas, and defects of face and scalp, and the results of surgical correction.

BODY SECTION RADIOGRAPHY (Dr. Francis E. O'Neill, Dr. Alvin Thaggard, Jr., and Dr. Jerome J. Wiesner, San Antonio). This is a visual demonstration of roentgenograms and descriptive placards of body section radiography of the lungs, skull, bones, and urinary tract.

ACTIVE IMMUNIZATION IN POLIOMYELITIS (Dr. Hart E. Van Riper, National Foundation for Infantile Paralysis, New York). The exhibit presents material on research leading to the development of a vaccine, minimal standards for production of a vaccine, and how the results of the vaccine trials will be evaluated.

KISSING BUG BITE, ITS RELATIONSHIP TO CHAGAS' DISEASE (Dr. E. N. Walsh and Dr. T. L. Shields, Fort Worth). This display is made up of placards and Kodachrome pictures which explain the relationship of the kissing bug and Chagas' disease.

TECHNIQUE OF PHYSICAL EXERCISE IN THE TREATMENT OF BRONCHIAL ASTHMA (Dr. Bernard T. Fein and Miss Eugenia P. Cox, San Antonio). The exhibit presents a technique of respiratory and physical exercise employed as a supplementary measure in the treatment of bronchial asthma.

COULD YOU USE PHYSICAL THERAPY? (Texas Chapter, American Physical Therapy Association, Miss Laura K. Smith, Houston). The exhibit shows how physical therapy is useful in orthopedics, neurology, pediatrics, internal medicine, and dermatology.

FREEDOM EXHIBIT (Association of American Physicians and Surgeons, Dr. Ernest E. Anthony, Fort Worth). This exhibit consists of placards on socialism, AAPS essay contest material, information for interns and residents, and bulletins and freedom literature.

ASSISTIVE DEVICES IN REHABILITATION OF UPPER EXTREMITY DISABILITIES (Dr. Odon F. Von Werssowetz, Miss Betty Schlosser, and Miss Rose Elliott, Gonzales Warm Springs Foundation, Gonzales). This is an exhibit and demonstration of devices used in the treatment of injury or disabilities resulting from disease and accidents such as hemiplegia, poliomyelitis, and multiple sclerosis.

AMERICAN ASSOCIATION OF BLOOD BANKS (Miss Marjorie Saunders, Dallas). The exhibit is designed to show the doctor, technologist, nurse, and researcher as well as administrative personnel of hospitals and blood banks how a good blood bank can be set up, what it can accomplish, and how the association can be of assistance in the setting up and improvement of the blood bank activities. An outline of a national blood bank clearinghouse also will be displayed.

LUNG CANCER (American Cancer Society, Texas Division, J. Louis Neff, Executive Director, Austin).

CORNEAL TRANSPLANTATION (Dr. Louis Daily, Jr., and Dr. Ray K. Daily, Houston).

OPERATIVE AND POSTOPERATIVE CHOLANGIOGRAPHY (Dr. R. P. O'Bannon and Dr. Otto H. Grunow, Fort Worth and Arlington). The exhibit contains radiographs, photographs, and legends detailing the method of examination and the merits and demerits of the two types of examinations.

Motion Pictures

Instead of continuous showing of motion pictures in a separate theater, as has been customary in previous years, selected films are included as a part of the scientific programs of Section A (Medical) and Section B (Surgical). Reference to these section programs will indicate the titles and hours of presentation of films (pp. 175 and 177).

TECHNICAL EXHIBITS

The technical exhibits will be displayed in the lower level of the Municipal Auditorium. These exhibits provide much of educational value for the physician. Without the armamentarium furnished by the concerns which exhibit at annual sessions, doctors would be seriously handicapped in the practice of scientific medicine. These exhibits are worth all the time and attention registrants at the sessions can give them. They should be visited without fail sometime between Monday morning, May 3, and Wednesday noon, May 5. Recesses in the program have been provided Tuesday and Wednesday from 10:00 to 10:30 a. m. and Tuesday from 3:30 to 4:00 p. m. to assure opportunity for everyone to view the exhibits.

An alphabetical list of exhibitors follows:

Abbott Laboratories, North Chicago, Booth 64

Erythrocin (Erythromycin, Abbott) will be displayed by Abbott Laboratories. Erythrocin, a new wide range antibiotic effective against a variety of organisms, especially against gram-positive ones, is indicated for treatment of infections such as pharyngitis, tonsillitis, scarlet fever, erysipelas, and pneumococcic pneumonia. The Abbott product is a small tablet specially coated to mask the bitter taste of the drug and effect higher blood concentrations. Erythrocin is effective against some strains of pathogenic organisms not responsive to penicillin or to other antibiotics.

Alcon Laboratories, Inc., Fort Worth, Booth 13

Alcon-efrin, Alcon's nonstinging and nonirritating nasal decongestant, supplied in three strengths, will be exhibited at booth 13 along with sterile ophthalmic solutions. In addition to Zincfrin, Op-thal-zin, Isopto Cetamide, and Isopto Alkaline—three new specialties for the treatment and control of glaucoma, namely, Isopto Carpine 1 per cent, Isopto Carpine 2 per cent, and Isopto Eserine .5 per cent, supplied in Drop-tainer (Alcon's new ophthalmic dropper container), will be displayed.

A. S. Aloe Company, St. Louis, Booth 74

Physicians are invited to visit booth 74, where the Aloe representative will show a cross section of the complete line of physicians' equipment and supplies carried by the A. S. Aloe Company. Highlighted will be New Model Steeline—tomorrow's treatment room furniture today—featuring the body contour table top, magnetic door catches, and advanced design, all in new decorators' colors.

American Medical Education Foundation, Chicago, Booth 56

Mr. Hiram Jones, executive secretary of the American Medical Education Foundation, will be at booth 56 to discuss the foundation with members and guests of the Texas Medical Association. Because of a growing disproportion between the rising costs associated with inflation and the decrease in income from endowments and fewer large benefactions contributed for basic educational needs, the foundation was organized in 1950 as an instrument through which contributions could be made in support of medical education. The state chairman is Dr. S. W. Thorn, Houston.

Audio-Digest Foundation, Glendale, Calif., Booth 57

The Audio-Digest Foundation, a nonprofit subsidiary of the California Medical Association, was established recently to further postgraduate medical education by means of tape recorded abstracts from current scientific literature and tape recorded lectures and panel discussions by medical and surgical authorities. The foundation will present an exhibit at booth 57.

Baby Development Clinic, Chicago, Booth 67

A maternity counseling service, offering demonstration material to aid in teaching expectant mothers care and support of the breast, support of abdomen and relief of back strain, and personal cleanliness, will be presented by the Baby Development Clinic. Preparation for infant and child care and aids on bathing, feeding, and toileting, as well as care of feet, also will be demonstrated. Material will be available for well baby conferences.

The Baker Laboratories, Inc., Cleveland, Booth 68

Physicians are invited to visit the Baker booth where Baker's Modified Milk and Varamel, two successful products for infant feeding, will be on display. Baker representatives will be glad to discuss the practical application of Grade A milk, adjusted fat composition, zero curd tension, synthetic vitamins, and other important factors which help to eliminate many problems in modern infant feeding.

Ballard Surgical Supply Company, San Antonio, Booth 33

Ballard Surgical Supply Company will exhibit its products in booth 33.

The Borden Company, New York, Booth 22

Physicians are invited to talk over the latest information on infant feeding at the Borden prescription products booth. On display will be the complete line of Borden's infant formula products for every feeding purpose or preference. Almost any baby can be fed Bremil, Mullsoy, Dryco, or Biolac.

George A. Breon and Company, New York, Booth 30

George A. Breon and Company, distributors of Lanteen products, invites convention members to its exhibit of reproductions of well-known paintings by famous European artists at booth 30. Lithographic prints of these beautiful paintings will be available on request. Representatives also will be happy to discuss Lanteen products with physicians.

Brown Schools for Exceptional Children, Austin and San Marcos, Booth 58

Brown Schools for Exceptional Children, of Austin and San Marcos, Texas, private schools for children with educational and emotional difficulties, will exhibit scale models of their six residential units along with materials describing their facilities and services. Representatives of the schools will be available for consultation, and materials will be distributed.

Carnation Company, Los Angeles, Booth 69

At booth 69 physicians may see an attractive display on Carnation Evaporated Milk—"the milk every doctor knows." Some valuable information on the use of this milk for in-

fant feeding, child feeding, and general diet will be explained as well as the reasons why Carnation Milk deserves consideration as the first choice for infant formulas. Interesting and valuable literature also will be available.

Charles Pharmacy, San Antonio, Booth 28

The exhibit in booth 28 will be presented by Charles Pharmacy of San Antonio.

Ciba Pharmaceutical Products, Inc., Summit, N. J., Booth 38

The Ciba exhibit will feature Apresoline, a phthalazine derivative which is an orally effective and relatively safe therapy in hypertension of diverse etiology. Representatives in attendance will be glad to discuss and to provide literature on this and other Ciba products.

Coca-Cola Bottling Company, Booth 12

The Coca-Cola Bottling Company will occupy booth 12 at the annual session in San Antonio.

Curtis Surgical Supply Company, Waco, Booth 20

The Curtis Surgical Supply Company will have on display some of the latest diagnostic equipment and surgical instruments of interest to the medical profession.

Cutter Laboratories, Berkeley, Calif., Booth 55

Cutter Laboratories, booth 55, will display Alhydrox adsorbed toxoids and combined vaccines as well as the exclusive human blood fractions—Albumin, Hypertussis, and the new human fibrinogen, Parenogen. Also on exhibit will be the complete Cutter Saftiflask Solutions line, featuring the Saftitab Stopper—safer because it is solid, yet with open stopper convenience. The new built-in Bend-the-Blue Safticlamp on intravenous and blood and plasma infusion equipment will be demonstrated.

Eaton Laboratories, Inc., Norwich, N. Y., Booth 62

Furadantin®(N.N.R.), the new chemotherapeutic nitrofuran for treatment of urinary tract infections, will be emphasized. The latest clinical reports prove its rapid effectiveness against the majority of bacteria without serious side effects. Various dosage forms of Furacin will be displayed, including Furacin Ophthalmic Liquid and Ointment. When pregnancy is contraindicated, Lorophyn Suppositories offer a simple technique of proven effectiveness.

First Texas Chemical Manufacturing Company, Dallas, Booth 19

The First Texas Chemical Manufacturing Company will exhibit its products at booth 19.

C. B. Fleet Company, Inc., Lynchburg, Va., Booth 35

C. B. Fleet Company, Inc., cordially invites physicians of Texas to stop at booth 35 to see the exhibit of Phospho-Soda (Fleet). Phospho-Soda (Fleet) is a solution containing in each 100 cc., sodium biphosphate 48 Gm. and sodium phosphate 18 Gm. Over the years Phospho-Soda (Fleet) has won discriminating preference by thousands of physicians because of its controlled action, its freedom from undesirable side effects, and its ease of administration. There is only *one* Phospho-Soda (Fleet).

General Electric Company, X-Ray Department, Dallas, Booth 73

The General Electric Company X-Ray Department representatives will be happy to visit with the company's many customer-friends. On display and available for demonstration will be the new DWB Cardioscribe.

The Gilbert X-Ray Company of Texas, Dallas, Booth 41

In booth 41, representatives of the Gilbert X-Ray Company of Texas will be on hand to greet their many friends attending this excellent medical meeting.

Graham Laboratories, Dallas, Booth 34

Graham Laboratories will feature allergenic extracts and plant oleoresins for the diagnosis and treatment of various allergic diseases. On display will be custom made Plexiglas Vial Trays and various type of serum vials and stoppers. Physicians are invited to visit the exhibit. Miss Paula Whitten will be in charge.

Group Hospital Service, Inc., Group Medical and Surgical Service, Dallas, Booth 39

Blue Cross and Blue Shield of Texas will exhibit items of interest to the doctors of Texas, relative to the experience of the plan over the past few years.

The Harrower Laboratory, Inc., Jersey City, Booth 10

Mucotin, which is the featured product at the exhibit of the Harrower Laboratory, Inc., is indicated in peptic ulcer and gastric hyperacidity. The product combines two antacids, magnesium trisilicate and aluminum hydroxide gel, with gastric mucin. A recent development in the processing of Mucotin tablets now has provided a tablet which disintegrates so rapidly that chewing is not required. Physicians have found that patients welcome this added convenience.

Hedgecock Artificial Limb Company, Dallas, Booth 11

Featured in the Hedgecock exhibit at booth 11 will be APRL Hook and Hand with the plastic arms developed and perfected by the University of New York and the University of California in cooperation with the Veterans Administration Research Program. The items are made, fitted, and completed in the Dallas factory. The newest type of socket for wearers of suction socket artificial legs also will be presented.

H. J. Heinz Company, Pittsburgh, Booth 44

Physicians are invited to visit the Heinz booth to receive the latest information about the Heinz baby food line. Literature will be available for office use concerning nutritional data and Heinz baby foods. For use by the patients there will be available booklets on "Your Baby's Diet," "Junior Foods for Older Babies," "Recipe Magic Using Heinz Strained and Junior Foods," and "Facts About Foods." Spill-proof tumblers will be a premium offer.

The Karmac Company, Dallas, Booth 32

On exhibit at booth 32 will be Plaster of Paris Bandages and Splints, manufactured by Karmac and made entirely by hand according to rigid specifications. Uniform in quality and performance, Karmac Bandages soak quickly and make a strong, light-weight cast. Available in both fast-setting and slow-setting types, the bandages are "Made in Texas by Texans for Texas Surgeons."

R. P. Kincheloe Company, Dallas, Booth 40

The R. P. Kincheloe Company will display Keleket x-ray apparatus, Cambridge direct writer electrocardiograph, and Liebel-Flarsheim short wave diathermy unit.

Eli Lilly and Company, Indianapolis, Booth 42

Physicians are invited to visit the Lilly exhibit in booth 42. The display will contain information on recent therapeutic developments and will feature the story of the Lilly junior taste panel. Lilly sales personnel will welcome questions about Ilotycin (Erythromycin, Lilly) and other Lilly products.

J. B. Lippincott Company, Philadelphia, Booth 63

J. B. Lippincott Company will present for physicians' approval a display of professional books and journals geared

to the latest and most important trends in current medicine and surgery. These publications, written and edited by men active in clinical fields and teaching, are a continuation of more than 100 years of traditionally significant publishing.

P. Lorillard Company, New York, Booth 24

P. Lorillard Company, manufacturers of Old Gold and Embassy Cigarettes as well as Briggs Pipe Mixture and other famous tobacco products, will exhibit and demonstrate its new Kent Cigarettes with the exclusive Micronite Filter, which takes out up to seven times more nicotine and tars than other filter cigarettes.

J. A. Majors Company, Dallas, Booth 31

The latest editions on medicine and surgery published by W. B. Saunders Company will be available for examination: "1954 Current Therapy"; Child, "Hepatic Circulation and Portal Hypertension"; Conant, "Clinical Mycology"; Mackie, "Manual of Tropical Medicine"; Sweet, "Thoracic Surgery"; "Mayo Clinic Diet Manual"; and Shackelford, "Surgery of Alimentary Tract" (two-volume set). Mr. L. B. Shaver will be in charge of the exhibit.

Mead Johnson and Company, Evansville, Ind., Booth 23

Mead Johnson and Company, booth 23, will show the recent change of formulation and other improvements in Dextri-Maltose. Lactum and Olac, Mead's two convenient, modified milk formulas for routine infant feeding, also will be featured, as well as the four Pablum Cereals.

Medcalf and Thomas, Fort Worth, Booth 70

In booth 70 representatives of the Surgical Department of Medcalf and Thomas will display surgical instruments, equipment, and supplies.

The Medical Protective Company, Fort Wayne, Ind., Booth 17

Exclusive application to the field of professional liability insurance endows The Medical Protective Company with a "know-how" in defense unlimited that distinguishes it from all others. It produces an enviable record in which policyholders suffer no involuntary loss from their own pockets in malpractice suits. Thereby, defense, rather than coverage limits, continues to prove the most effective protective factor.

Miles Reproducer Company, Inc., New York, Booth 8

Case histories, lectures, and dictation may now be recorded at a 60-foot radius with Walkie-Recordall, an 8-pound, self-powered battery recorder-transcriber. The voice-activated "self-start-stop" feature automatically starts and stops the recording from microphone or telephone, thus eliminating supervision and the recording of silent periods. Up to eight hours of permanent recordings may be accumulated at intervals on an endless belt costing 25 cents.

Mission Pharmacal Company, San Antonio, Booth 18

Featured by the Mission Pharmacal Company will be Isoval, the safe daytime nonbarbiturate sedative, together with Homapin, an effective antispasmodic. Messrs. H. N. Walsdorf, T. Y. Chapin, and O. B. Adams, Jr., will be in attendance.

Murray Agency, Corpus Christi, Booth 43

A physician will be paid $8,800 a year when he is unable to work at his profession as the result of sickness or accident. On exhibit at booth 43 will be the new improved combined coverage contract written by the Metropolitan Casualty Insurance Company of New York and the Washington National Insurance Company of Chicago. Physicians are invited to meet "Sid Murray Pays in a Hurry," general agent.

Pendleton and Arto, Inc., Houston, Booth 61

Pendleton and Arto invites its many friends to visit booth 61, where the new Raytheon Microtherm and a complete line of instruments will be on display. The company's representative, Mr. M. Pat Daley, will be on hand to welcome visitors.

Pfizer Laboratories, Brooklyn, Booth 72

Physicians are invited to visit the Pfizer booth where well-informed representatives will be happy to supply information and answer any questions relative to Pfizer products. Terramycin dosage forms and Bonamine will be the feature attractions of the Pfizer exhibit.

Physicians and Surgeons Supply Company, San Antonio, Booth 46

The Physicians and Surgeons Supply Company of San Antonio will present an exhibit of its surgical products at booth 46.

R. J. Reynolds Tobacco Company, Winston-Salem, N. C., Booth 26

Welcome will be extended to physicians at the Camel-Cavalier exhibit, and cigarette cases (monogrammed with initials) containing Camels, America's most popular cigarette, or Cavaliers, the king size cigarette of extra mildness and distinctive flavor, will be given to guests.

Richards Manufacturing Company, Memphis, Booth 65

One of the most complete lines of fracture equipment and orthopedic instruments in the country will be shown by Richards. There will be a full line of splints for simple fractures as well as instruments for all types of orthopedic surgery and neurosurgery. Intramedullary nails, both cloverleaf and diamond, will be displayed, as well as Jewett (one piece forged) trochanteric nails, pneumatic tourniquets, and all sundry items. Mr. Johnson will be glad to see all his friends at booth 65.

A. H. Robins Company, Inc., Richmond, Va., Booth 21

The A. H. Robins Company exhibit will feature Robalate, N.N.R. antacid-demulcent indicated in peptic ulcer therapy and hyperacidity. The pharmaceutically elegant tablets, each containing 0.5 Gm. dihydroxy aluminum aminoacetate, are notable for exceptional palatability.

Schering Corporation, Bloomfield, N. J., Booth 16

Members of the Texas Medical Association and their guests are cordially invited to visit the Schering exhibit, where new therapeutic developments will be featured. Schering representatives will be present to welcome physicians and to discuss the company's products.

G. D. Searle and Company, Chicago, Booth 71

Physicians are invited to visit the Searle booth, where members of the medical and medical service departments will be happy to answer questions regarding Searle Products of Research, such as new approved uses for Dramamine and Banthine as well as such items as Searle Aminophyllin, Alidase, Metamucil, and Diodoquin.

The Sommers Drug Stores Company, San Antonio, Booth 59

The Sommers Drug Stores Company, San Antonio, will occupy booth 59.

SoundScriber of San Antonio, Inc., San Antonio, Booth 29

The SoundScriber exhibit in booth 29 will display the complete line of SoundScriber electronic disk dictation equipment. This will include the new and unique "Tycoon" individual and combination units, pace-setter in modern dictation. Interview and telephone recording accessories also

will be featured. Physicians are invited to see SoundScriber, world's most versatile dictation system.

Southern Medical Association, Booth 36

Southern Medical Association will display at booth 36 booklets of information about the organization and copies of the *Southern Medical Journal*. The group's president-elect, Dr. Robert L. Sanders, Memphis, who will preside over the 1955 meeting in Houston, is to be one of the guests of the Texas Medical Association at this annual session.

Noa Spears Company, San Antonio, Booths 53 and 54

Noa Spears Company will exhibit its line of surgical instruments at booths 53 and 54.

Taylor Laboratories, Inc., Houston, Booth 47

Taylor Laboratories will be pleased to call to the attention of Texas physicians the following products: Aminophylline Tablets and Aminophylline in combination with Phenobarbital. Also, the franchise held by the Taylor Laboratories of the Wilson Laboratories in Chicago will enable Taylor representatives to present Corticotropin, Gel and Solution, in the most acceptable potencies.

Terrell Supply Company, Fort Worth, Booth 15

The Terrell Supply Company will exhibit its products at booth 15.

Texas Medical Association Memorial Library, Austin, Booth 27

The Memorial Library of the Texas Medical Association will feature in its exhibit at booth 27 "A History of the Texas Medical Association, 1853-1953" by Dr. Pat I. Nixon, San Antonio. Copies of the book will be available for sale, and Dr. Nixon will be on hand to autograph them. Material explaining the services of the Memorial Library also will be on display.

Texas Pharmacal Company, San Antonio, Booth 49

On exhibit at booth 49 will be products of the Texas Pharmacal Company.

United Medical Equipment Company, Kansas City, Booth 9

The new Profexray 300 milliampere, 100 kilovolt motor driven tilt table with the completely automatic control will be exhibited. Also on display will be the all new PC-3 Cardiotron, the direct-writing electrocardiographic machine; the Raytheon Microwave Diathermy; plus the new E. P. L. Portable Meta-Basal.

U. S. Vitamin Corporation, New York, Booth 45

Physicians are invited to visit booth 45 to see the "oil-in-water" demonstration of natural vitamin A oil in water solution—a vitamin technical achievement pioneered by the U. S. Vitamin Corporation Research Laboratories—with further clinical proof of superior absorption and utilization of aqueous vitamin A. Also, physicians may wish to see and taste the new and different sodium-free salt substitute, Co-Salt, which actually tastes like salt, looks like salt, and sprinkles like salt—a great boon to patients on restricted sodium intake.

VanPelt and Brown, Richmond, Va., Booth 14

VanPelt and Brown extends a cordial invitation to visit the exhibit in booth 14, where representatives will be happy to answer questions and supply clinical samples of their products.

Varick Pharmacal Company, Inc., New York, Booth 37

E. Fougera and Company, Inc., and its division, Varick Pharmacal Company, cordially invite physicians to discuss with professional service representatives new preparations of importance to their everyday practice. Descriptive literature and samples of all products will be available.

Walden Industries, Inc., New York, Booth 7

Simple, automatic, and economical equipment for clinical close-up photography will be shown. Quick-Clix Projection Bulb and Strobe Outfits feature fully automatic aperture and shutter control mechanisms for finest color or black and white pictures. The low-priced Walco Lighting Unit utilizes fixed focus applicators to make photography extremely easy for busy practitioners.

William A. Webster Company, Memphis, Tenn., Booth 48

The Webster Company plans to exhibit its complete line of suppositories, trade named Supprettes, and five drugs using the exclusive, newly developed water-soluble suppository base, Neocera, which blends high and low molecular weight waxes for controlled break-down and complete, uniform absorption and requires no refrigeration. The products using this unique base for the administration of medicine rectally are Aquachloral (chloral hydrate), Pentobarbital Sodium, Gentian Violet, Theophylline, and Theophylline-Pentobarbital.

Westinghouse Electric Corporation, Baltimore, Booths 50 and 51

Representatives of Westinghouse will be pleased to meet and discuss with Texas physicians future or present requirements, from the details in the darkroom to the style and type of equipment for any specialty. Representatives are well prepared to custom-plan x-ray facilities. Westinghouse appreciates this opportunity to present its x-ray products to Texas physicians at this meeting.

Westwood Pharmaceuticals, Buffalo, N. Y., Booth 25

Gentia-Jel, the specific gentian violet therapy in vaginal moniliasis of pregnancy, in the new, single-dose disposable applicator, will be on exhibit at booth 25, as well as Lowila Cake, the only lathering soapless skin cleanser for patients sensitive to soap, and Pro-Derna, a silicone skin protective cream, the first really effective skin protective to prevent contact dermatitis.

Wilson X-Ray and Surgical Company, Austin, Booth 60

The formal opening of the complete laboratory department of Wilson X-Ray and Surgical Company has been announced. This includes all laboratory equipment as well as supplies and incorporates the merchandise of Clay-Adams, Glasco, American Optical Company (Spencer Division), E. Leitz, Inc., Difco, Anderson Laboratories, and others. This department is now headed by a registered laboratory technician who is in a position to help physicians with their problems and will be happy to furnish information as to types of equipment and supplies needed to do specific tests. An invitation is extended to physicians to visit booth 60.

Winthrop-Stearns Inc., New York, Booth 66

Winthrop-Stearns, Inc., invites physicians to visit booth 66, where Levophed and Telepaque will be featured. Levophed bitartrate is a powerful pressor antidote for shock due to myocardial infarction, surgical and nonsurgical trauma, hemorrhage, and other causes. Levophed is noted for its prompt, predictable, reliable, and easily controlled action and is administered diluted in 5 per cent dextrose or dextrose in saline infusion. Telepaque, a highly effective and well tolerated oral cholecystopaque medium, gives denser, clear cut pictures of the gallbladder and, in a substantial number of cases, also permits visualization of the biliary ducts.

OFFICERS, COUNCILS, AND COMMITTEES

Following are the officers, councils, and committees of the Texas Medical Association for the year 1953-1954 with the year in which their terms of office expire indicated in parentheses:

Officers

George Turner, El Paso, President.
F. J. L. Blasingame, Wharton, President-Elect.
Andrew S. Tomb, Victoria, Vice-President.
J. M. Travis, Jacksonville, Secretary (1956).
N. C. Forrester, Austin, Executive Secretary.
T. H. Thomason, Fort Worth, Treasurer (1956).
Hobart O. Deaton, Fort Worth, Speaker of the House of Delegates.
Charles P. Hardwicke, Austin, Vice-Speaker of the House of Delegates.

Board of Trustees

Robert W. Kimbro, Cleburne, Chairman (1957).
G. V. Brindley, Temple, Vice-Chairman (1955).
Denton Kerr, Houston, Secretary (1958).
Sam N. Key, Austin (1956).
E. A. Rowley, Amarillo (1954).

Board of Councilors

First District, J. Leighton Green, El Paso (1955); C. E. Oswalt, Jr., Fort Stockton, Vice-Councilor.
Second District, R. B. G. Cowper, Big Spring (1954); Chester U. Callan, Rotan, Vice-Councilor.
Third District, Frank B. Malone, Lubbock (1956); H. H. Latson, Amarillo, Vice-Councilor.
Fourth District, H. L. Locker, Brownwood (1955); O. H. Chandler, Ballinger, Vice-Councilor.
Fifth District, J. L. Cochran, San Antonio (1956); J. J. Hinchey, San Antonio, Vice-Councilor.
Sixth District, Franklin W. Yeager, Corpus Christi (1956); Stanley W. Bohmfalk, Weslaco, Vice-Councilor.
Seventh District, J. M. Coleman, Austin, Vice-Chairman (1954); W. B. Hahn, Austin, Vice-Councilor.
Eighth District, James H. Wooten, Jr., Columbus (1954); John L. Otto, Galveston, Vice-Councilor.
Ninth District, J. T. Billups, Houston, Secretary (1954); A. M. Dashiell, Houston, Vice-Councilor.
Tenth District, L. C. Heare, Port Arthur (1954); Stephen B. Tucker, Nacogdoches, Vice-Councilor.
Eleventh District, C. E. Willingham, Tyler (1955); Lynn Hilbun, Henderson, Vice-Councilor.
Twelfth District, J. Wilson David, Corsicana (1956); Howard O. Smith, Marlin, Vice-Councilor.[1]
Thirteenth District, R. G. Baker, Fort Worth, Chairman (1955); L. J. Webster, Abilene, Vice-Councilor.[2]
Fourteenth District, Mayo Tenery, Waxahachie (1955); L. W. Johnston, Terrell, Vice-Councilor.
Fifteenth District, H. O. Padgett, Marshall (1956); Hugh M. Ragland, Gilmer, Vice-Councilor.

Delegates to American Medical Association

T. C. Terrell, Fort Worth (1955).
M. O. Rouse, Dallas (1955).
J. B. Copeland, San Antonio (1955).
A. C. Scott, Jr., Temple (1954).
John K. Glen, Houston (1954).
Robert B. Homan, Jr., El Paso (1954).
Delegate Designate, James H. Wooten, Jr., Columbus (1954).

Alternate Delegates to American Medical Association

J. C. Terrell, Stephenville (1955).
Troy Shafer, Harlingen (1955).
George Turner, El Paso (1955).
John L. Otto, Galveston (1954).
Robert W. Kimbro, Cleburne (1954).
L. C. Heare, Port Arthur (1954).

Executive Council

Ex-officio, President (Chairman), President-Elect, Vice-President, Secretary, Executive Secretary, Treasurer, Speaker of the House of Delegates, Vice-Speaker of the House of Delegates, Board of Trustees, Board of Councilors, Texas Delegates to the American Medical Association, Chairmen of All Councils, Members of the Council on Medical Jurisprudence, and Chairman of the Committee on Public Relations.

Council on Medical Defense

Charles L. McGehee, San Antonio, Chairman (1955).
Joe Nichols, Atlanta (1958).
P. M. Kuykendall, Ranger (1957).
Harold M. Williams, Austin (1956).
John H. Wootters, Houston (1954).
George Turner, El Paso (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Jurisprudence

J. B. Copeland, San Antonio, Chairman (1957).
J. W. Rainer, Odessa (1958).
Robert D. Moreton, Fort Worth (1956).
John K. Glen, Houston (1955).
G. W. Cleveland, Austin (1954).
George Turner, El Paso (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Scientific Work

May Owen, Fort Worth, Chairman (1957).
Clyde A. Stevenson, Temple (1958).
L. Bonham Jones, San Antonio (1956).
Kleberg Eckhardt, Corpus Christi (1955).
George W. Waldron, Houston (1954).
George Turner, El Paso (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Economics

Harvey Renger, Hallettsville, Chairman (1957).
E. W. Jones, Wellington (1958).
A. G. Barsh, Lubbock (1956).
Raleigh R. Ross, Austin (1955).
H. H. Cartwright, Breckenridge (1954).
George Turner, El Paso (ex-officio).
N. C. Forrester, Austin (ex-officio).

Council on Medical Education and Hospitals

M. O. Rouse, Dallas, Chairman (1958).
John L. Matthews, San Antonio (1957).
Truman G. Blocker, Jr., Galveston (1956).
W. S. Barcus, Fort Worth (1955).
R. Lee Clark, Jr., Houston (1954).
George Turner, El Paso (ex-officio).
N. C. Forrester, Austin (ex-officio).

War Council

Ex-officio, President (Chairman), President-Elect, Vice-President, Secretary, Executive Secretary, Treasurer, Speaker of the House of Delegates, Board of Trustees, Board of

[1] *Appointed September 16, 1953, to fill the vacancy created by the resignation of Dr. Clifford G. Swift, Cameron.*
[2] *Appointed September 16, 1953, to fill the vacancy created by the resignation of Dr. H. H. Cartwright, Breckenridge.*

Councilors, Chairmen of All Councils, and Chairman of the Committee on Public Relations.

Committee on Cancer

Porter Brown, Fort Worth, Chairman (1958).
C. T. Ashworth, Fort Worth (1957).
R. E. Windham, San Angelo (1956).
John H. Wootters, Houston (1955).
Charles Phillips, Temple (1954).

Committee on Medical History

Vacancy, Chairman (1954).[3]
Tate Miller, Dallas (1958).

Texas Hospital Association.—T. C. Terrell, Fort Worth.

Texas State Nutrition Council.—Joe Nichols, Atlanta.

State Rural Health Council.—Chester U. Callan, Rotan.

Lone Star State Medical Association.—L. L. D. Tuttle, Houston.

Louisiana State Medical Association.—L. C. Heare, Port Arthur.

Arkansas Medical Society.—J. M. Travis, Jacksonville.

Texas State Dental Society.—Elliott Mendenhall, Dallas.

New Mexico Medical Society.—Leigh Wilcox, El Paso.

Texas Polio Planning Committee.—J. Edward Johnson, Austin.

Officers of Scientific Sections

Section A (Medical)

John R. Winston, Temple, Co-Chairman.
Richard E. Nitschke, San Antonio, Co-Chairman.
Robert A. Gardner, Houston, Secretary.

Section B (Surgical)

O. W. English, Lubbock, Chairman.
Robert F. Short, Jr., Dallas, Secretary.

Section on General Practice

Sheldon M. Tucker, Houston, Chairman.
Van D. Goodall, Clifton, Secretary.

Section on Internal Medicine

Richard E. Nitschke, San Antonio, Chairman.
John R. Winston, Temple, Secretary.

Section on Surgery

O. W. English, Lubbock, Chairman.
Robert F. Short, Jr., Dallas, Secretary.

Section on Obstetrics and Gynecology

E. E. Anthony, Fort Worth, Chairman.
S. Foster Moore, Jr., San Antonio, Secretary.

Section on Eye, Ear, Nose, and Throat

Hal W. Maxwell, Dallas, Chairman.
Oliver W. Suehs, Austin, Secretary.

Section on Radiology

Royal Wertz, Amarillo, Chairman.
Delphin Von Briesen, El Paso, Secretary.

Section on Public Health

Maurice A. Roe, Dallas, Chairman.
Austin E. Hill, Houston, Secretary.

Section on Clinical Pathology

A. J. Gill, Dallas, Chairman.
J. L. Goforth, Dallas, Secretary.

Section on Pediatrics

John A. Welty, Harlingen, Chairman.
Robert A. Gardner, Houston, Secretary.

Local Committees

Alumni.—William D. Montgomery, Chairman; G. G. Passmore, University of Texas School of Medicine; C. C. Shotts, Baylor University College of Medicine; J. Walter Park, III, Southwestern Medical School of the University of Texas; James E. Pridgen, Tulane University of Louisiana School of Medicine; William M. Center, University of Arkansas School of Medicine; Mildred E. Ward, Louisiana State University School of Medicine; Thomas H. Diseker, University of Tennessee College of Medicine and Vanderbilt University School of Medicine.

Fraternity.—William J. Johnson, Jr., Chairman; Edwin M. Sykes, Jr., Alpha Kappa Kappa; Hugh P. Reveley, Nu Sigma Nu; S. Perry Post, Phi Beta Pi; James L. Mims, Jr., Phi Chi; R. Bernard Pomerantz, Phi Delta Epsilon; John L. Matthews, Phi Rho Sigma; William J. Fetzer, Theta Kappa Psi.

Halls and Lanterns.—Robert R. Nixon, Chairman; John P. Heaney, Vernon S. Wier.

Hotels.—John M. Smith, Jr., Chairman; Jack B. Lee, Ralph A. Munslow.

Information.—S. Perry Post, Chairman; Benjamin B. Shaver, Pat I. Nixon, Jr.

Memorial Services.—B. F. Stout, Chairman; J. L. Cochran, P. I. Nixon.

Publicity.—A. F. Clark, Jr., Chairman; O. Roger Hollan, Jack M. Partain.

Scientific Exhibits.—Arthur C. Ressmann, Chairman; Lawrence M. Shefts, Frank M. Posey, Jr.

Social.—Joseph W. Palmer, Chairman; John C. Parsons, John J. DeLeon, William W. Sawtelle, Robert H. Vadheim, William J. Block, Jr.

Sports (Golf).—John B. Case, Chairman; John C. Parsons, Arthur B. Pyterek.

Technical Exhibits.—Carl E. Bosshardt, Chairman; Robert F. Gossett, Daniel D. Altgelt.

Transportation.—Adolfo Urrutia, Chairman; Walter Walthall, Phillip L. Day.

GUEST SPONSORS

For Dr. Simeon T. Cantril.—Francis E. O'Neill, San Antonio.

For Dr. George T. Harrell.—C. Ralph Letteer, San Antonio.

For Dr. Harold D. Palmer.—Benjamin B. Shaver, San Antonio.

For Mr. William Alan Richardson.—Jack M. Partain, San Antonio.

For Dr. Robert L. Sanders.—Robert F. Gossett, San Antonio.

For Dr. E. Stewart Taylor.—E. T. Coates, San Antonio.

HOUSE OF DELEGATES

First Meeting, Sunday, May 2, 9:00 a. m.

North Terrace, Gunter Hotel

1. Call to Order.
2. Preliminary Report of Reference Committee on Credentials.
3. Reading of Minutes of Previous Meeting.
4. Announcements of Reference Committees.

COUNTY SOCIETIES

Andrews-Ector-Midland Counties Society

Henrie Mast, Midland, is serving as president for 1954 of the Andrews-Ector-Midland Counties Medical Society; H. E. Hestand, Odessa, vice-president; Clarence Mast, Midland, secretary-treasurer; and Z. W. Hutcheson, Jr., Andrews, chairman of censors.

Armstrong-Donley-Childress-Collingsworth-Hall Counties Society

December 10, 1953

The Armstrong-Donley-Childress-Collingsworth-Hall Counties Medical Society and its woman's auxiliary held a Christmas party December 10 in Memphis. Memphis doctors and their wives were hosts for the turkey dinner. The party was in observance of Doctor's Day, and the physicians wore red carnations. Separate business meetings followed the party. Approximately thirty members and guests attended.

Bee-Live Oak-McMullen Counties Society

December 14, 1953

New officers were elected at the December 14 meeting of the Bee-Live Oak-McMullen Counties Medical Society in Beeville. They are L. W. Kirkland, Beeville, president; George W. Sansom, George West, vice-president; James L. Reagan, Beeville, secretary; and Ernest Miller, Beeville, public relations chairman.

Brazoria County Society

January 28, 1954

(Reported by Carlos E. Fuste, Jr., Secretary)

Placenta Previa—A. L. Dippel, Houston.

Members of Brazoria County Medical Society met January 28 at Freeport to hear Dr. Dippel present the above talk.

A. O. McCary, Freeport, announced that at a recent district meeting of the Texas Heart Association at Galveston, it was decided to establish a rehabilitation and reclassification clinic in connection with the Cardiac Clinic at John Sealy Hospital. M. Warren Hardwick, Angleton, is president of the Brazoria County Chapter of the Texas Heart Association.

Cameron-Willacy Counties Society

January 18, 1954

(Reported by Harry A. Miller, Executive Secretary)

Estate Tax Planning for Physicians—Mr. Herbert Croft, San Antonio.

The Cameron-Willacy Counties Medical Society met in Harlingen January 18, with approximately eighty-eight society and auxiliary members present for dinner.

Mr. Croft's talk on estate tax planning was followed by a brief question and answer period.

David Lancaster, Ned Chase, and Fred Duckworth were accepted as new members.

A finance report was given by David F. Nickell, Harlingen. Dr. Nickell proposed that a portion of the society's funds be used to purchase government bonds or some revenue bearing commodity.

Richard Bernard, Harlingen, in connection with the recent tuberculosis test survey held in the Harlingen vicinity, requested his colleagues to send in follow-up reports of the test cases as soon as possible so that they may be included in the report to the Texas Tuberculosis Association.

Dr. Bernard also called attention to the fact that Harlingen has not had a city health officer for over a year. A committee of Harlingen physicians, composed of Dr. Bernard, John Welty, and Howard Tewell, was appointed to confer with city commissioners in the hope of procuring a physician for the post of public health officer.

Comal County Society

December 8, 1953

LeRoy Schleicher was elected president of the Comal County Medical Society December 8 at the home of J. Frederick Casto, New Braunfels, outgoing president.

Other new officers are Jack Bergfeld, vice-president; Thomas H. Brandes, secretary-treasurer; W. W. Sullivan, delegate; Dr. Brandes, alternate; and John K. Schaefer, Dr. Schleicher, and Dr. Casto, censors. All officers are from New Braunfels.

Falls County Society

December 14, 1953

Officers for the coming year were elected at a December 14 dinner-meeting of the Falls County Medical Society in Marlin. J. S. Bussell became president; Walter Reese, vice-president; J. C. Hohf, secretary; E. P. Hutchings, censor; Neil Buie, delegate; and A. C. Bennett, alternate, all from Marlin.

A scientific paper was presented by M. A. Davison, Marlin, prior to the election. Following the business meeting, the group joined the woman's auxiliary for a Christmas party at the home of Thomas Glass.

Grayson County Society

December 15, 1953

New officers of the Grayson County Medical Society, elected December 15 in Denison, follow: Paul Pierce, Denison, president; John Hardy, Sherman, vice-president; Joseph Stout, Sherman, secretary; and E. L. Hailey, Denison, treasurer. Delegate and alternate are Robert Duncan, Denison, and D. C. Enloe, Sherman, respectively.

The election followed a dinner. Vernon L. Tuck, Sherman, presided.

Harris County Society

January 13, 1954

(Reported by Mrs. W. M. Palm, Public Relations Secretary)

Rh Factor and Its Significance—William R. Knight, Houston.

After hearing the above discussion by Dr. Knight, the Harris County Medical Society held a business meeting January 13 at the Medical Arts Building in Houston.

L. E. Williford, president-elect, discussed the Houston Academy of Medicine Library Building, which is under construction in the Texas Medical Center and is expected to be completed in late spring or early summer. The library will have 40,000 volumes and stack capacity for 150,000.

Denton Kerr explained the functions of the Manion Commission and stated that the society should cooperate in the work of this commission.

W. B. Thorning, chairman of the medical jurisprudence committee, reviewed pertinent legislation pending in the national Congress. Petitions were circulated supporting the Bricker Amendment and opposing the entrance of Red China into the United Nations.

Harrison County Society

December 11, 1953

Diagnosis and Treatment of Thyroid Diseases — C. F. Hamilton, Dallas.

Members and guests of the Harrison County Medical Society heard the above discussion December 11 in Marshall by Dr. Hamilton, who was the recipient of the Van Meter prize from the American Goiter Association for his work in radioactive iodine treatment of thyroid diseases.

The society's new officers include C. A. Wyatt, president; Roger Harmon, vice-president; N. F. Holcomb, secretary; R. G. Granbery, delegate; and J. H. Harris, alternate, all of Marshall.

Hays-Blanco Counties Society

December 15, 1953

J. R. deSteiguer, secretary of the Hays-Blanco Counties Medical Society for twenty years, at the group's meeting December 15 in San Marcos refused to accept nomination for the office again. Dr. deSteiguer, an honorary member of the Texas Medical Association and the only surviving charter member of the local society, is past 80 years old and has practiced medicine for sixty-three years.

The officers elected follow: Benge Elliott, San Marcos, president; M. C. Williams, San Marcos, vice-president; M. D. Heatly, San Marcos, secretary-treasurer; T. C. McCormick, Buda, delegate; and Dr. Heatly, alternate. Censors are W. L. Moore and C. W. Scheib of San Marcos and J. J. Flannery of Blanco.

Hidalgo-Starr Counties Society

December 8, 1953

New officers of the Hidalgo-Starr Counties Medical Society elected at the society's December 8 meeting in Pharr follow: Paul H. Frenzel, president; Berton F. Frink, vice-president; and Sheridan Evans, secretary-treasurer, all of McAllen.

The election was held after a dinner with the local woman's auxiliary.

Hunt-Rockwall-Rains Counties Society

December 8, 1953

John C. Vallancey was elected president of Hunt-Rockwall-Rains Counties Medical Society during a business session December 9 in the home of F. S. Carruthers, Greenville, preceding the annual dinner given by the local woman's auxiliary.

Other officers elected were Warren Hancock, vice-president; Ralph Jenks, secretary; S. D. Whitten, delegate; and C. B. Weis, alternate delegate. Joe Becton was named to the board of censors. All new officers are from Greenville.

Jasper-Newton Counties Society

December 17, 1953

J. W. McCall, Jasper, was elected president of the Jasper-Newton Counties Medical Society at its Christmas party with the woman's auxiliary December 18 in the home of W. F. McCreight, Kirbyville. Rider Stockdale, Jasper, is the new vice-president; Tom R. Jones, Pineland, secretary-treasurer; J. J. McGrath, Jasper, delegate; and John Moore, Kirbyville, alternate.

Jefferson County Society

January 1, 1954

Officers of Jefferson County Medical Society who assumed office on January 1 follow: Dan H. Byram, Port Arthur, president; W. Pierre Robert, Beaumont, president-elect; F. J. Beyt, Port Arthur, vice-president; and Irving M. Richman, Beaumont, secretary-treasurer.

Delegates to the Texas Medical Association are L. C. Carter, Port Arthur; J. C. Crager, Beaumont; and L. C. Powell, Beaumont. Alternate delegates include Paul R. Meyer, Port Arthur; Thomas B. Matlock, Port Arthur; and Dr. Robert Jefferson County board of censors consists of John M. White, Port Arthur, and C. H. Hendry and E. H. Lindsey, Beaumont. Dr. Hendry is chairman of the censors.

Kerr-Kendall-Gillespie-Bandera Counties Society

December, 1953

When the Kerr-Kendall-Gillespie-Bandera Counties Medical Society met in December, new officers were elected. They follow: H. C. Day, Boerne, president; Russell Guill, Kerrville, vice-president; Mathis Blackstock, Kerrville, secretary; George Meador, Bandera, treasurer; D. R. Knapp, Kerrville, delegate; Choice Matthews, Kerrville, alternate; William Earl Gregg, Kerrville, public relations chairman; and David McCullough, Kerrville, tuberculosis chairman.

Joshua Seidel, chief surgeon at the Veterans Administration Hospital in Kerrville, was elected to membership.

Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Society

December 11, 1953

Inoculation Program—John C. Spencer, Crystal City.
Fungus Diseases of Lungs—David McCullough, Kerrville.
Care and Correction of Congenital Intestinal Deformities—Robert Nixon, San Antonio.
Technique and Interpretation of Tests of Neurological Reflexes—Lewis Helfer, San Antonio.

At the meeting of Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Medical Society held at the Crystal City Country Club, December 11, the following physicians were elected as new officers: Frank H. Pratt, Rocksprings, president; B. O. Lewis, Eagle Pass, vice-president; Woods A. Howard, Uvalde, secretary-treasurer.

A resolution was adopted that persons handling food and drink should have a chest roentgenogram taken before being certified by any society members as being free from communicable disease.

After the above scientific program and a business meeting, a dinner was held with the local woman's auxiliary.

Navarro County Society

December 12, 1953

Newly elected officers of Navarro County Medical Society, who were chosen at its December meeting in Corsicana, are: W. W. Carter, president; Will Miller, vice-president; James Barnebee, secretary-treasurer; and William T. Shell, delegate, all of Corsicana.

Entertainers from Baylor University provided the program for the fifty-fourth annual banquet-meeting of the society.

Palo Pinto-Parker-Young-Jack-Archer Counties Society

December, 1953

Reminiscing—William M. Campbell, Weatherford.

Palo Pinto-Parker and Young-Jack-Archer Counties Medical Societies have joined to form one society. At the society's December meeting, held in Mineral Wells, John B. Merrick, Weatherford, was elected president. Other officers are William O'Quin, Mineral Wells, vice-president; Joe T. Nelson, Weatherford, secretary; E. F. Yeager, Mineral Wells, delegate; and B. B. Griffin, Graham, alternate delegate. R. C. Jordan, Mineral Wells, was named on the four-member censor committee.

It was decided that Mineral Wells will be the permanent meeting place.

Dr. Campbell, who has been in active practice for sixty-five years and who is 94 years of age, spoke on the above subject.

Potter County Society

January 11, 1954

(Reported by James L. Johnson, Secretary)

Surgical Treatment of Thrombotic Occlusion of Abdominal Aorta—Oscar Creech, Jr., Houston.
Discussion—Walter C. Watkins, Amarillo.

The Potter County Medical Society met January 11 in Amarillo to hear Dr. Creech, associate professor of surgery, Baylor University College of Medicine, speak on the above topic. His lecture was illustrated with color slides, and Dr. Watkins led a discussion on the subject.

At the business meeting the application for membership of S. Victor Yeakel was accepted, and Robert P. Gallagher was nominated to honorary membership.

Attention was called to the January 20 meeting in Amarillo of the Panhandle Area of the Academy of General Practice and to the Texas Medical Association county society presidents and secretaries meeting January 23 in Austin. It was voted that the society's president and secretary be sent at the society's expense to the Austin meeting.

Reeves-Ward-Winkler-Loving-Culberson-Hudspeth Counties Society

December 17, 1953

Fractures of Elbow in Children—Cecil Robinson, Kermit.

About forty doctors and their wives attended the Christmas party December 17 at Kermit of the Reeves-Ward-Winkler-Loving-Culberson-Hudspeth Counties Medical Society. Following the turkey dinner, separate meetings were held. The society heard the above scientific discussion and elected the follcwing new officers: B. A. Wight, Kermit, president; F. M. Applegate, Monahans, vice-president; and Harper Peddicord, Kermit, secretary-treasurer.

Tarrant County Society

January 19, 1954

(Reported by S. W. Wilson, Secretary)

Panel Discussion: Evaluation of Laboratory Procedures in the Study of the Patient—May Owen, Moderator; John J. Andujar; Charles T. Ashworth; C. D. Fitzwilliam; and O. J. Wollenman, Fort Worth.

Approximately seventy-five members of the Tarrant County Medical Society were present for its January 19 meeting in Fort Worth to hear the above scientific program.

C. M. Whorton was elected to membership. Tribute was paid C. C. Garrett, who died January 1.

A letter from the Texas Medical Association regarding telephone postgraduate broadcasts, scheduled for February 17 and March 9, was read by the secretary. The society decided to receive only the February broadcast.

A report of the legislative committee was given by Ernest E. Anthony, Jr., chairman. In connection with this report, a recording was heard of a portion of the address given at the Dallas County Medical Society inaugural banquet by Clarence Manion, J. D., former dean of Notre Dame Law School.

J. H. Steger announced that the Federal Narcotics Bureau plans to close the local office. It was decided that the society should write a letter of protest to the Commissioner of Narcotics.

War veteran physicians interested in forming a local chapter of medical veterans were invited by Ralph Clayton of Dallas to discuss plans for such a society with him.

Washington-Burleson Counties Society

December, 1953

Thomas Giddings was elected president of the Washington-Burleson Counties Medical Society at its December meeting in Brenham. Other new officers are Joe C. Smith, Caldwell, vice-president, and C. E. Southern, Brenham, secretary-treasurer. Dr. Giddings is from Brenham.

The group discussed plans for the Ninth District Medical Society meeting, for which it will be host on March 25.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

February 9, 1954

(Reported by S. E. Thompson, Secretary)

What State and County Medical Societies Mean to Medical Profession—Mr. N. C. Forrester, Austin.
Obstetric and Gynecologic Problems—Walter S. Morse and Hiram P. Arnold, Houston.

The scientific program outlined above was presented at the February 9 meeting of the Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society in Wharton. Mr. Forrester is executive secretary of the Texas Medical Association. Drs. Morse and Arnold led the panel discussion which consisted primarily of questions and answers of everyday obstetric and gynecologic problems arising in general practice.

Fifty-two members, auxiliary members, and guests were present.

Wichita County Society

December 8, 1954

Pelvic Pain—William F. Mengert, Dallas.

A meeting of the Wichita County Medical Society was held in Wichita Falls December 8. George Siebold, president, presided until James Lee, president-elect, was installed as new president.

A program committee was appointed by Dr. Lee with the following physicians as members: Julian Acker, Louis Theimer, and Kenneth Bebb. Members of the society voted to continue presentation of the fall clinical conference, and L. N. Simmons was named to direct next year's conference.

Named as delegate to the annual session was J. D. Hall. E. Aubrey Cox was elected as alternate delegate.

Bailey Collins urged attendance at cancer clinics and reminded members that the spring tumor clinic would be March 31.

Dr. Mengert, professor of obstetrics and gynecology at Southwestern Medical School of the University of Texas, talked on the above subject.

DISTRICT SOCIETIES

Seventh District Society

February 18, 1954

(Reported by William F. McLean, Secretary)

Dosimetric Determinations in Carcinoma of Cervix—John A. Wall, Houston.

Clinicopathologic Panel Discussion—Richard A. Lucas, Austin, Moderator; Roy H. Morris, Elgin; Henry Renfert, Austin; James F. Houghton, Taylor; Winston M. Brook, Lampasas; and C. F. Pelphrey, Austin.

The midwinter scientific session of the Seventh District Medical Society was held February 18 at the Texas Medical Association's headquarters building in Austin. The program was presented as outlined above. A movie was shown in connection with Dr. Wall's discussion. Sixty members attended. Clary Bates, Austin, district president, presided.

The society voted to nominate David Wade, Austin, as Councilor for District 7.

A buffet dinner was held and special entertainment provided by the Austin Civic Theater in the evening for 182 members and guests.

Reference.—Mrs. Joseph B. Foster (Chairman), Houston; Mrs. William Hibbitts, Texarkana; Mrs. Max Woodward, Sherman.

Research.—Mrs. J. Peyton Barnes (Chairman), Houston; Mrs. Speight Jenkins, Dallas.

Resolutions.—Mrs. Joseph H. McCracken, Jr. (Chairman), Dallas; Mrs. Carlos R. Hamilton, Houston; Mrs. S. M. Hill, Dallas; Mrs. Newton F. Walker, El Paso.

Revisions.—Mrs. Edward C. Ferguson (Chairman), Beaumont; Mrs. T. H. Thomason, Fort Worth; Mrs. Scott C. Applewhite, San Antonio.

School of Instruction.—Mrs. Ramsay H. Moore (Chairman), Dallas.

Year Books.—Mrs. R. T. Travis (Chairman), Jacksonville; Mrs. Dudley Jackson, Jr., San Antonio.

COUNCIL WOMEN

District 1.—Mrs. Harold Lindley, Pecos.
District 2.—Mrs. Thomas P. Marinis, Midland.
District 3.—Mrs. E. K. Jones, Wellington.
District 4.—Mrs. Perry J. C. Byars, San Angelo.
District 5.—Mrs. John L. Pridgen, San Antonio.
District 6.—Mrs. June Yates, Corpus Christi.
District 7.—Mrs. Thomas J. Archer, Austin.
District 8.—Mrs. William D. Nicholson, Freeport.
District 9.—Mrs. H. O. Sappington, Baytown.
District 10.—Mrs. R. C. Bellamy, Liberty.
District 11.—Mrs. Melvin Wilcox, Jr., Athens.
District 12.—Mrs. Milton Spark, Waco.
District 13.—Mrs. Jack A. Crow, Abilene.
District 14.—Mrs. James Atchison, Gainesville.
District 15.—Mrs. D. C. Simmons, Kilgore.

COUNTY PRESIDENTS

District 1:

El Paso.—Mrs. Newton F. Walker, El Paso.
Pecos-Jeff Davis-Presidio-Brewster.—Mrs. C. E. Oswalt, Jr., Fort Stockton.
Reeves-Ward-Winkler-Loving-Culberson-Hudspeth.—Mrs. Hugh W. Martin, Pecos.

District 2:

Andrews-Ector-Midland.—Mrs. H. P. McCrimmon, Odessa.
Dawson-Lynn-Terry-Gaines-Yoakum.—Mrs. F. E. Seale, Lamesa.
Howard-Martin-Glasscock-Borden-Scurry-Kent-Dickens-Garza-King-Stonewall.—Mrs. Milton W. Talbot, Jr., Big Spring.
Nolan-Fisher-Mitchell.—Mrs. T. D. Young, Sweetwater.

District 3:

Armstrong-Donley-Childress-Collingsworth-Hall.—Mrs. Dale V. Watkins, Wellington.
Dallam-Hartley-Sherman-Moore.—Mrs. William V. Coventry, Dumas.
Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson.—Mrs. W. C. Barksdale, Borger.
Hale-Floyd-Briscoe-Swisher.—Mrs. Russell K. Williams, Plainview.
Hardeman-Cottle-Foard-Motley.—Mrs. C. C. Pate, Paducah.
Lamb-Bailey-Hockley-Cochran.—Mrs. W. C. Nowlin, Littlefield.
Lubbock-Crosby.—Mrs. Alvin W. Bronwell, Lubbock.
Potter.—Mrs. Wilbert E. Scott, Amarillo.
Randall-Deaf Smith-Parmer-Castro-Oldham.—Mrs. R. A. Neblett, Canyon.

District 4:

Brown-Comanche-Mills-San Saba.—Mrs. Oscar N. Mayo, Brownwood.
Coleman.—Mrs. J. C. Young, Coleman.
Crane-Upton-Reagan.—Mrs. John L. Wright, Big Lake.

Kimble-Mason-Menard-McCulloch.—Mrs. B. A. Hallum, Jr., Brady.
Runnels.—Mrs. Lloyd L. Downing, Ballinger.
Tom Green-Coke-Crockett-Concho-Irion-Sterling-Sutton-Schleicher.—Mrs. W. Lacey Smith, San Angelo.

District 5:
Atascosa.—Mrs. U. B. Ogden, Pleasanton.
Bexar.—Mrs. John C. Parsons, San Antonio.
Comal.—Mrs. Rennie Wright, New Braunfels.
Gonzales.—Mrs. David Shelby, Gonzales.
Guadalupe.—Mrs. J. T. Goetz, Seguin.
Karnes-Wilson.—Mrs. H. J. Bonstetter, Kenedy.
Kerr-Kendall-Gillespie-Bandera.—Mrs. L. A. Feller, Fredericksburg.
LaSalle-Frio-Dimmit.—Mrs. C. P. Myers, Cotulla.
Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala.—Mrs. A. P. Utterback, Brackettville.

District 6:
Bee-Live Oak-McMullen.—Mrs. John W. Reagan, Beeville.
Brooks-Duval-Jim Wells.—Mrs. George G. Wyche, Sr., Alice.
Cameron-Willacy.—Mrs. John A. Welty, Harlingen.
Hidalgo-Starr.—Mrs. James Fitch, McAllen.
Kleberg-Kenedy.—Mrs. Newell D. Boyd, Kingsville.
Nueces.—Mrs. Sam Powell, Corpus Christi.
San Patricio-Aransas-Refugio.—Mrs. J. L. Pierce, Jr., Sinton.
Webb-Zapata-Jim Hogg.—Mrs. M. E. Malakoff, Laredo.

District 7:
Bastrop-Lee.—Mrs. Robert B. Burns, Giddings.
Caldwell.—Mrs. A. A. Ross, Lockhart.
Hays-Blanco.—Mrs. C. W. Scheib, San Marcos.
Lampasas-Burnet-Llano.—Mrs. W. M. Brook, Lampasas.
Travis.—Mrs. Charles B. Dildy, Austin.
Williamson.—Mrs. A. J. Rice, Georgetown.

District 8:
Brazoria.—Mrs. Robert C. Miller, Lake Jackson.
Colorado-Fayette.—Mrs. A. J. Watzlavick, Schulenburg.
DeWitt-Lavaca.—Mrs. James Buttery, Hallettsville.
Galveston.—Mrs. Andrew J. Magliolo, Dickinson.
Victoria-Calhoun-Goliad.—Mrs. Heaton Smith, Victoria.
Wharton-Jackson-Matagorda-Fort Bend.—Mrs. Robert Leslie, El Campo.

District 9:
Austin-Waller.—Mrs. M. Graham Bolton, Hempstead.
Grimes.—Mrs. E. T. Ketchum, Navasota.
Harris.—Mrs. Jacob F. Schultz, Houston.
East Harris Chapter.—Mrs. H. O. Sappington, Baytown.
Montgomery.—Mrs. Henry D. Bell, Conroe.
Polk-San Jacinto.—Mrs. T. L. Gardner, Livingston.
Walker-Madison-Trinity.—Mrs. Sam Barnes, Trinity.
Washington-Burleson.—Mrs. G. V. Pazdral, Somerville.

District 10:
Angelina.—Mrs. M. A. Estep, Lufkin.
Hardin-Tyler.—Mrs. John H. Tate, Kountze.
Jasper-Newton.—Mrs. John T. Moore, Kirbyville.
Jefferson.—Mrs. S. V. Granata, Beaumont.
Liberty-Chambers.—Mrs. O. W. Harris, Liberty.
Nacogdoches.—Mrs. J. Frank Beall, Nacogdoches.
Orange.—Mrs. David Bennett, Orange.
Shelby-San Augustine-Sabine.—Mrs. Spencer Warren, Center.

District 11:
Anderson-Houston-Leon.—Mrs. Robert H. Bell, Palestine.
Cherokee.—Mrs. Collier Rucker, Jacksonville.
Freestone.—Mrs. Jack R. Cox, Teague.
Henderson.—Mrs. Don Price, Athens.
Rusk-Panola.—Mrs. Jesse E. Ross, Henderson.
Smith.—Mrs. Jesse Goldfeder, Tyler.
Wood.—Mrs. James W. Williams, Mineola.

District 12:
Bell.—Mrs. R. N. Bartels, Temple.
Bosque.—Mrs. Seth L. Witcher, Clifton.
Brazos-Robertson.—Mrs. Thomas O. Walton, Jr., College Station.
Coryell.—Mrs. Kermit R. Jones, Gatesville.
Erath-Hood-Somervell.—Mrs. Carl A. Jordan, Dublin.
Falls.—Mrs. Clarence R. Miller, Marlin.
Hamilton.—Mrs. Robert A. Kooken, Hamilton.
Hill.—Mrs. James M. Buie, Whitney.
Johnson.—Mrs. Elmo L. Clark, Cleburne.
Limestone.—Mrs. O. T. Christoffer, Mexia.
McLennan.—Mrs. Eldon B. Fine, Waco.
Milam.—Mrs. John T. Richards, Rockdale.
Navarro.—Mrs. Paul H. Mitchell, Corsicana.

District 13:
Baylor-Knox-Haskell.—Mrs. Edwin H. Balch, Seymour.
Clay-Montague-Wise.—Mrs. John W. Major, Nocona.
Eastland-Callahan-Stephens-Shackelford-Throckmorton.—Mrs. Thomas Carroll Ford, Breckenridge.
Palo Pinto-Parker.—Mrs. William A. O'Quinn, Mineral Wells.
Tarrant.—Mrs. W. N. Jenkins, Fort Worth.
Taylor-Jones.—Mrs. Sol Estes, Abilene.
Wichita.—Mrs. W. L. Parker, Wichita Falls.
Wilbarger.—Mrs. F. B. Steele, Vernon.

Address.—Guest Speaker.

Presentation of Gavel and of Past Presidents' Medallion.

COUNTY AUXILIARIES

Public relations is the project of the *Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Auxiliary* for the year, as its new officers assumed their duties March 12. The new officers, elected December 11 at Crystal City, are Mrs. L. M. Cartall, Del Rio, president; Mrs. B. O. Lewis, Eagle Pass, president-elect; Mrs. G. B. Cunningham, Uvalde, first vice-president; Mrs. Raul Montemayor, Eagle Pass, second vice-president; Mrs. Carey Poindexter, Crystal City, third vice-president; Mrs. John C. Spencer, Crystal City, parliamentarian; and Mrs. B. L. Burditt, Del Rio, secretary-treasurer.

Mrs. S. Byrd Longino discussed public relations at the January 6 meeting of the *Hopkins-Franklin Counties Auxiliary* in Sulphur Springs. She pointed out that state medical auxiliaries are discovering that in this eventful period public opinion is the mightiest force on earth.

Members of the dental auxiliary and wives of physicians at the Veterans Administration Hospital and the Amarillo Air Force Base Hospital were guests at a come-and-go Christmas tea given by the *Potter County Auxiliary* December 15 in the home of Mrs. A. J. Streit, Amarillo.

Mrs. A. L. Nelson was hostess for the Christmas party of the *Nacogdoches County Auxiliary* on December 9 at Nacogdoches. The auxiliary voted to contribute to the Jaycee Christmas cheer fund.

At its January 7 luncheon meeting in Longview, the *Gregg County Auxiliary* completed the shower of linens begun in December for the Cerebral Palsy Clinic in Kilgore. The shower is an annual project of the auxiliary. A Christmas theme was carried out at the group's December luncheon at the Gregg County Airport. It was decided to offer three cash prizes for the local essay contest sponsored nationally by the Association of American Physicians and Surgeons.

With a Valentine's Day theme, the *El Paso County Auxiliary* honored Mrs. Edward W. Coyle, San Antonio, State Auxiliary President, at a luncheon in El Paso on February 8. Sharing honors with her was Mrs. Harold Lindley, Pecos, council woman for District 1. Mrs. Coyle spoke of health education, public relations, and legislation.

Mrs. Coyle and Mrs. Mark H. Latimer, Houston, President-Elect of the State Auxiliary, were guests at a luncheon given by the *Jefferson County Auxiliary* January 12 in Beaumont. Presidents from District 10 auxiliaries were invited also.

The *Navarro County Auxiliary* voted to send a contribution to the American Medical Education Foundation and to the Student Loan Fund at its February 5 meeting at the home of Mrs. E. H. Newton, Corsicana. Plans also were completed for the heart fund drive which the auxiliary is sponsoring for the second year, and a film on the heart, "Be Your Age," was shown. On February 10 the group raised $200 for the heart fund from a benefit coffee at the home of Mrs. J. H. Barnebee. A pamphlet, "Fables and Facts About Heart Disease," was presented to each guest by Mrs. C. L. Gary, Jr.

A health education booth was sponsored by the *Bexar County Auxiliary* at the San Antonio Live Stock Exposition from February 12 to 21, with Mrs. John C. Parsons as chairman. Two exhibits were shown: "You and Your Body," with manikins showing the organs of the human body, and "Where Your Medical Dollar Goes." The auxiliary honored wives of doctors attending the International Medical Assembly with a luncheon and style show on January 28. A luncheon with a Valentine motif was held at the February meeting, at which new officers were elected, includ-

ing Mrs. J. Lewis Pipkin, president; Mrs. L. Bonham Jones, president-elect; Mrs. Ruskin Norman, first vice-president; Mrs. Thomas Diseker, second vice-president; Mrs. M. H. Morris, third vice-president; Mrs. James Blair, Jr., fourth vice-president; Mrs. E. A. Maxwell, recording secretary; Mrs. Louis Manhoff, corresponding secretary; Mrs. Graham Coffman, publicity secretary; Mrs. Martin Jensen, historian; Mrs. Jack Partain, treasurer; and Mrs. Fred Cooper, auditor.

Following the annual election on January 15, new officers were installed at the February meeting in Corpus Christi of the *Nueces County Auxiliary.* Mrs. E. Jackson Giles serves as president; Mrs. Paul Gray, president-elect; Mrs. Harold E. Griffin, first vice-president; Mrs. C. B. Slabaugh, second vice-president; Mrs. J. Gordon Bryson, third vice-president; Mrs. Hugh A. Kennedy, recording secretary; Mrs. C. R. Little, corresponding secretary; Mrs. Charles Clark, treasurer; Mrs. Maurice Nast, reporter; Mrs. G. S. Ahern, historian; and Mrs. Sam Powell, parliamentarian. Also at the February meeting a panel discussion was presented by members of various hospital auxiliaries.

AUXILIARY DEATHS

Mrs. Gayle Moore Joseph, wife of Dr. P. S. Joseph, Alice, died January 12, 1954. She was a member and past president of the Brooks-Duval-Jim Wells Counties Medical Auxiliary.

Mrs. Margaret Richardson, widow of the late Dr. Dalton Richardson, Austin, died February 18, 1954, in a local hospital. A member and past president of the Woman's Auxiliary to the Travis County Medical Society, Mrs. Richardson in 1949 served on the State Executive Board as chairman of the Committee on Resolutions.

DEATHS

J. F. PATTISON

Dr. John Frazer Pattison, Big Lake, Texas, died November 19, 1953, at a local hospital of acute myocardial failure due to bronchial asthma.

The son of Dr. Isreal and Alice (Coleman) Pattison, Dr. Pattison was born June 3, 1874, in Oelwein, Iowa, where his father was a physician and a state representative. Dr. Pattison joined the United States Navy when he was 14 years old and attended the naval school at Newport, R. I., and later made cruises to Europe and the Far East. He sailed for Japan and China in 1891 aboard the USS Lancaster, the Navy's last wooden vessel that was powered by both sail and steam. In 1895, after leaving the Navy, Dr. Pattison became a student at the College of Physicians and Surgeons, Kansas City, Kan., until the Spanish-American War broke out two years later. He reenlisted in the Navy as a gunner's mate and served aboard the USS New Orleans, then the fastest ship in the Navy, for a year, after which he returned to medical school and was graduated in 1900 from the College of Physicians and Surgeons. He did postgraduate work at Drake University College of Medicine, Des Moines; the University of Kansas School of Medicine, Lawrence-Kansas City; and Kentucky University Medical Department, Louisville.

Before moving to Texas, Dr. Pattison practiced at Oelwein, where he was assistant surgeon for Chicago-Great-Western Railway Company in the Dr. I. Pattison Emergency Hospital, and at Augusta, Kan., and served in France in the United States Army Medical Corps in World War I, reaching the rank of captain. He was physician and surgeon for the Texon Oil and Gas Company, Santa Rita, and surgeon for Humble Oil Company, Big Lake. Dr. Pattison was city health officer and Reagan County health officer for twenty-nine years, during which time he instituted free immmunization for all county school children.

An honorary member of the Texas Medical Association since 1949 and a member since 1930, Dr. Pattison also belonged to the American Medical Association and the Crane-Upton-Reagan Counties Medical Society, of which he was a charter member, the first president, and again president in 1939. He assisted in the organization of the American Legion at Big Lake and was the first commander, an honorary member, and holder of a silver lifetime membership card. Also at Big Lake he was first commander of the Veterans of Foreign Wars, a position he held until his death. Dr. Pattison had been a member of the Episcopal Church since 1901. He was a member of the Masonic Order for fifty-eight years.

Dr. Pattison married the former Miss Amy A. Beal on February 7, 1903, at Earlville, Iowa. She survives, as do a son, Donald I. Pattison, Barstow, Calif.; two sisters, Mrs. Alice Matthie, Los Angeles, and Mrs. Sara Phillips, Seattle; four grandchildren; and four great-grandchildren.

A. G. MARSHALL

Dr. Alex George Marshall, El Paso, Texas, died from injuries received in an automobile accident near Indio, Calif., December 25, 1953. Dr. Marshall and his wife, who also was killed in the accident, were en route to Los Angeles to visit their son, a student at the University of California.

Born in Chicago, September 29, 1904, Dr. Marshall was the son of Sam and Mollie Marshall. He attended public schools and Crane College in Chicago before being graduated in 1927 from the University of Illinois College of Medicine and serving an internship at Cook County Hospital, Chicago. He practiced in Chicago from 1928 until 1939, at which time he moved to El Paso as a specialist in internal medicine. There he was chief of medicine at Hotel Dieu, and on the staffs of Providence Memorial and Southwestern General Hospitals. While in Chicago, he was instructor in medicine at the University of Illinois and clinical assistant at Mt. Sinai Hospital dispensary.

A member of the Texas Medical Association through El Paso County Medical Society, Dr. Marshall was a member of the American Medical Association. He was a Mason, Shriner, and member of the board of directors of Congregation B'nai Zion.

Mrs. Marshall was the former Miss Augusta Rapoport. They married in Chicago in 1928.

Dr. Marshall is survived by two sons, Howard D. Marshall, Beverly Hills, Calif., and Edward Marshall, El Paso; and his mother, Mrs. Mollie Marshall, Chicago.

C. C. GARRETT

Dr. Clarence Coleman Garrett, Fort Worth, Texas, died suddenly January 1, 1954, of a heart attack in a local hospital where he was making rounds.

Born in Richmond, Texas, April 26, 1902, Dr. Garrett was the son of Clyde Barbee and Cora (Anders) Garrett. He attended high school in Crockett and Southern Methodist University in Dallas before receiving his medical

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

degree from the University of Pennsylvania School of Medicine, Philadelphia, in 1927. After interning at the Hospital of the University of Pennsylvania, Dr. Garrett moved to Fort Worth, where he was house physician at the Cook Memorial Hospital from 1929 to 1931 and then specialized in internal medicine.

Dr. Garrett belonged to the American Medical Association and the Texas Medical Association through the Tarrant County Medical Society, for which he had been editor of the *Bulletin* since 1947. He also belonged to the Thirteenth District Medical Society, the Fort Worth Academy

DR. C. C. GARRETT

of Medicine, and the Fort Worth Club of Internists. In medical school he was a member of Phi Beta Pi medical fraternity and Alpha Omega Alpha honorary medical fraternity. At the time of his death, he headed the medical section of the civil defense program in Fort Worth.

On November 17, 1932, in Fort Worth, Dr. Garrett married the former Miss Mary Jane Joyslin, who survives him. Other survivors include a daughter, Mrs. Jane Garrett Molpus, and a sister, Mrs. W. R. Sullivan, Dallas.

G. F. THORNHILL

Dr. Gabriel Felder Thornhill, Austin, Texas, died of coronary occlusion at his home, January 8, 1954.

Born in Navasota, March 31, 1890, the son of Dr. G. F. and Mary (Buckingham) Thornhill, Dr. Thornhill attended Paris high school. He received bachelor and master of science degrees from the University of Virginia, Charlottesville, and was graduated from New York Medical College, Flower and Fifth Avenue Hospitals, New York City, in 1919. He served an internship at Flower Hospital from 1919 to 1921. Continuing to practice medicine in New York for fourteen years, he was assistant attending physician at Fifth Avenue and Metropolitan Hospitals, head of the staff of the ear, nose and throat department of the Doctor's Hospital, consulting physician at Judson Health Centre, and instructor at Columbia University College of Physicians and Surgeons. He did postgraduate work at Metropolitan Hospital in New York.

A resident of Austin since 1936, Dr. Thornhill specialized in diseases of the ear, nose, and throat, being a diplomate of the American Board of Otology, Laryngology, and Rhinology. He had been state health director of the National Youth Administration, a member of the State Committee for Procurement and Assignment of Physicians, on the board of directors of Brackenridge Hospital, and a member of the medical staff of St. David's Hospital.

Dr. Thornhill was a member of the American and Texas Medical Associations through Travis County Medical Society, and a fellow of the American College of Surgeons. He had served as both president and secretary of his county society. He had been director and president of the Austin Chamber of Commerce and president of the Travis County Red Cross Chapter. He was a Rotarian, Mason, Shriner and Jester. He belonged to the American Legion and the Methodist Church. While at the University of Virginia, he was an outstanding athlete in golf, track, and baseball. In New York, he won the Metropolitan Golf Championship. He continued to be interested in golf, hunting, and fishing.

On June 10, 1926, Dr. Thornhill married the former Miss Weta Ingram in New York. She and a son, Gabriel Felder Thornhill, III, both of Austin, survive. Also surviving are his mother, Mrs. G. F. Thornhill, Paris, and two sisters, Mrs. George Robert Coleman, Amarillo, and Mrs. Clara Hammond, New York.

B. M. AVENT

Dr. Benjamin M. Avent, Rosebud, Texas, died November 17, 1953, after a long illness.

Born in Lafayette Springs, Miss., January 1, 1868, Dr. Avent lost his parents when he was a youngster and grew up in Texas. He attended school in Bartlett; the University of Alabama; and the old Memphis Hospital Medical College, Memphis, Tenn., from which he received his degree of doctor of medicine in 1897. After serving a preceptorship under a physician at Rogers, Dr. Avent set up his own

DR. B. M. AVENT

practice in Briary, Milam County. He then served the Baileyville and Barclay communities before locating in nearby Rosebud, where he had been in practice for well over fifty years, being city health officer for eighteen years and retiring from practice only last year.

Dr. Avent was elected to honorary membership in the Texas Medical Association in 1948 after being affiliated

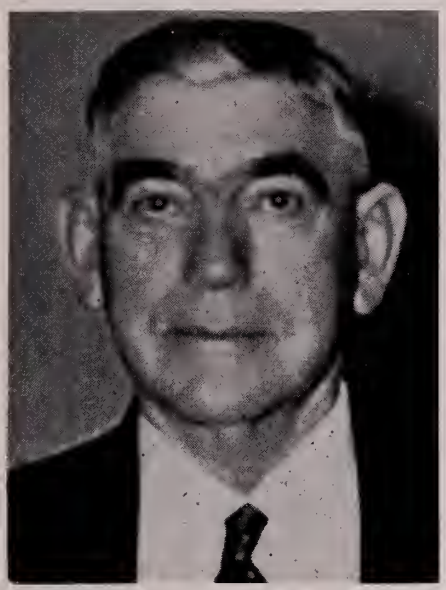
with the organization almost continuously since 1908. He was a member first through Milam County and more recently through Falls County Medical Society, and also belonged to the American Medical Association. He was a member of the Baptist Church and a Mason, recently receiving the Silver Button award of the latter order for a half century of service. He formerly was president of the Rosebud school board.

Survivors include Mrs. Avent; three sons, Dr. W. M. Avent, Waco; Hugh Avent, Greenville, S. C.; and Rhette Avent, Houston; four daughters, Mrs. L. A. Johnston and Mrs. H. M. Bennett, both of Houston; Mrs. E. H. O'Neal, Rosebud; and Mrs. Floyd Blakeney, Hobbs, N. M.

C. C. ANDERSON

Dr. Charles Cleveland Anderson, Venus, Texas, died in a Dallas Hospital, January 16, 1954, of coronary thrombosis.

The son of Hiram Winslow and Mary (Abel) Anderson, Dr. Anderson was born July 6, 1886, in Burnsville, Miss. He attended Oglesby public schools and the Medical Department of Tulane University of Louisiana, New Orleans, receiving his medical degree in 1913 from St. Louis College of Physicians and Surgeons. Dr. Anderson practiced medicine in Tishimingo and Greer Counties, Okla., before



DR. C. C. ANDERSON

locating in 1913 in Venus. For several years, Dr. Anderson was Venus' only physician. When in 1941 the one drug store closed, he also was for a number of years the town's only pharmacist.

A member of the American Medical Association and Texas Medical Association through Johnson County Medical Society, he was elected in 1940 to honorary membership in the state Association. He had been railroad surgeon for the Missouri Pacific Lines for thirty years. He was a Mason, being a Knight Templar and Shriner, and belonged to the Venus Lions Club. He also was a member of the Church of Christ.

Dr. Anderson served as president of the Venus school board and vice-president of the Citizens Bank of Venus for a number of years. He also was instrumental in obtaining several farm-to-market roads in his county.

On March 2, 1909, Dr. Anderson married the former Miss Leona Wilson in Whitney. She survives as do a son, Dr. H. M. Anderson, San Angelo; a daughter, Mrs. Peggy Wallace, San Angelo; two grandsons, Macky Anderson, San Angelo, and Billy Charles Roten, Venus; three brothers, Winslow Anderson, Dallas; Mason Anderson, Houston; and Jessie Anderson, Houston; six sisters, Mrs. F. A. Morris, Sr., Oglesby; Mrs. Hill Stewart, Lubbock; Mrs. W. E. Mize, Shawnee, Okla.; Mrs. A. C. Slade, Bismarck, N. D.; Mrs. John Nesbit, Houston; and Miss Woodie Mae Anderson, Houston.

L. G. AIDE

Dr. Lewis George Aide, linguist, writer, and physician of Bellmead (Waco), Texas, died December 12, 1953, of coronary thrombosis.

The son of Khalil and Barbara Aide, Dr. Aide was born in Maaser-El-Shouf, Lebanon, December 28, 1892. He came to the United States when he was 9 years of age and was graduated from Crosby High School at Waterbury, Conn. After serving two years in France with the United States Army, he worked with the American Red Cross in Europe

DR. L. G. AIDE

and the Middle East before returning to the United States in 1920. He entered Columbia University, New York, and obtained a medical degree from Long Island College of Medicine, Brooklyn, in 1927. After serving an internship at St. Peter's Hospital, Brooklyn, he practiced in that city for ten years, during which time he was vice-president of the Knights of Columbus, was president of the St. Nicholas Club, and organized and was president of the Democratic Club. In 1939 Dr. Aide moved to Texas, practicing for one year at Waelder and then becoming physician for the Veterans Administration Hospital in Denton. He was transferred to Waco to serve the Civilian Conservation Corps camp there and in Gatesville, and remained in Waco after he returned to private practice in 1942. He set up his offices in Bellmead, where he also established a weekly community newspaper, the *La Vega Citizen,* serving as its editor until a full-time editor could be employed. He was a member of the McLennan County Medical Society, Twelfth District Medical Society, Texas Medical Association, and American Medical Association; a captain in the Texas State Guard; a member of the Syrian-American Club of Waco; and a member of the Catholic Church.

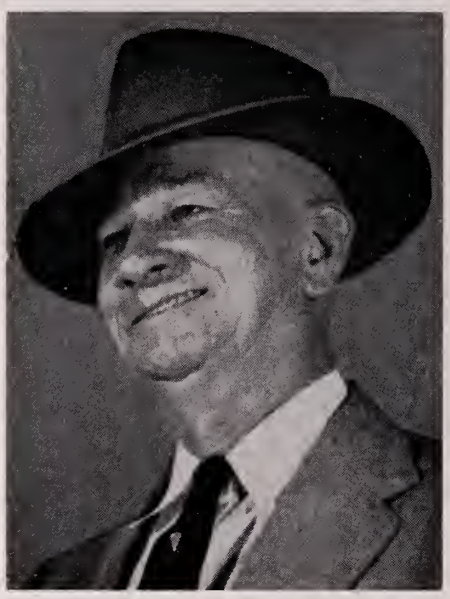
Dr. Aide spoke fluently Arabic, French, Spanish, and German, as well as English, and had translated poems, proverbs, and other works of literature from the original Arabic. He was himself a poet and had completed two novels at the time of his death. He also was interested in photography, woodworking, leatherwork, music, and amateur radio.

A son, Lt. Fouad K. Aide, Camp Gordon, Ga.; two brothers, Nick Aide, Brooklyn, N. Y., and George Aide, Orlando, Fla.; a sister, Miss Mathilde Aide, Bellmead; and a granddaughter, Miss Barbara Mathilde Aide, Austin, survive.

C. W. BORING

Dr. Clarence William Boring, Port Arthur, Texas, died in a local hospital January 5, 1954, of hypertension and coronary thrombosis.

A member of a well-known pioneer family, Dr. Boring was born in Homer, La., September 1, 1882, the son of James Wafer and Carrie (Edwards) Boring. He attended Opelousas public schools and was graduated in 1904 from Louisville Medical College, Louisville, Ky. After graduation, Dr. Boring interned at City Hospital in Louisville. For twenty-three years, Dr. Boring practiced in Breaux Bridge, La., where he established the Boring-Youngue Sanatorium in 1921. He was chief medical examiner for St.



DR. C. W. BORING

Martin Parish, La., draft board during World War I, and for Jefferson County during World War II. Dr. Boring had been coroner and county health officer of St. Martin Parish and city health officer of Breaux Bridge. He served as mayor of Breaux Bridge for twelve years, was a Mason and a member of the Methodist Church. He also was a member of the Louisiana State Medical Society and the Third Congressional District Medical Society.

After moving in 1927 to Port Arthur, he practiced there for more than twenty years. He was a member of the Texas Medical Association through Jefferson County Medical Society, being a member of the state Association almost successively since 1929. He was an honorary member of the county society and also an honorary member of St. Mary's Hospital staff, Port Arthur.

Dr. Boring, on November 7, 1908, married Miss Frank Stewart; to this union were born four sons. Mrs. Boring died in 1919. On April 14, 1923, he wed Miss Marie Cormier. They became the parents of a daughter, Carrie Marie, who died at the age of 6.

Dr. Boring is survived by his wife; four sons, Don and Jack Boring, of Port Arthur; John S. Boring of Baltimore; and C. W. Boring, Jr., of New York; three sisters, Mrs. E. V. Chauvin of Lafayette, La.; Mrs. Lee Wilson, Opelousas, La.; and Mrs. Wesley J. Miles of Crowley, La.; four grandsons; and a granddaughter.

A. J. EVANS

Dr. Andrew Jackson Evans, Mineral Wells, Texas, died December 10, 1953, following a six months' illness after suffering a cerebral hemorrhage on June 13.

Dr. Evans was born March 10, 1880, near Jacksonville, the son of Edmond C. and Mary Elizabeth (Denison) Evans. He attended old Fort Worth Medical College and in 1909 was graduated in medicine and pharmacy from the University of Louisville School of Medicine, Louisville, Ky.

DR. A. J. EVANS

Later he did postgraduate work in surgery at Mayo Clinic, Rochester, Minn., and Cooke County Hospital, Chicago.

Beginning his practice of medicine in Reece, where he also operated a drug store, Dr. Evans moved two years later to Caddo and then to Weatherford before locating in 1919 in Mineral Wells.

Dr. Evans belonged to the Texas Medical Association and American Medical Association through Palo Pinto-Parker Counties Medical Society. He was president of the county society in 1943. He also held membership in the Southern Medical Association and Thirteenth District Medical Society. He was a member and had been president of the staff of Nazareth Hospital in Mineral Wells. For many years, he was chairman of the board of stewards of the First Methodist Church of Mineral Wells.

Dr. Evans on March 8, 1905, near Tyler, married the former Miss Alvarine C. Phillips, who survives. Also surviving are two sons, A. Kenneth Evans and E. Cecil Evans, D. O.; two daughters, Mrs. G. L. Grantham and Mrs. F. J. Armstrong, Jr., all of Mineral Wells; a cousin, Miss May

Denison, who lived in the Evans home; a niece, Mrs. Mamie Patterson, Dallas, whom he reared as his own child; eleven grandchildren; and one great-grandchild.

B. L. JENKINS

Dr. Berry L. Jenkins, Clarendon, Texas, died January 11, 1954; he had not been well since suffering a stroke in May, 1953.

Dr. Jenkins was born January 4, 1867, at Dallas in a house on the present site of the Baker Hotel. He attended public school in Mansfield and old Mansfield College, and was graduated from Vanderbilt University School of Medicine, Nashville, Tenn., in 1891. After practicing in Ellis, Briscoe, and Parker Counties, at first under the supervision of a preceptor, he moved to Palo Pinto County, practicing there for almost twenty years. In 1910 Dr. Jenkins settled in Clarendon, where he lived until his retirement in 1941. He at one time was local surgeon for the Texas and Pacific Railway and for the Strawn Coal Company.

DR. BERRY L. JENKINS

A member for almost fifty years of the Texas Medical Association, Dr. Jenkins was elected to honorary membership in 1945. He belonged to Armstrong-Donley-Childress-Collingsworth-Hall Counties Medical Society, serving as its secretary for five years, and previously had belonged to Palo Pinto-Parker Counties society. He was a member of the Third District Medical Society and of the Presbyterian Church.

On June 12, 1894, Dr. Jenkins married the former Miss Maggie Buster of Weatherford. Mrs. Jenkins died in 1943. Survivors include two sons, Dr. Oscar L. Jenkins, Dallas, and B. L. Jenkins, Jr., Amarillo; two grandchildren; and two great-grandchildren.

C. B. BUCK

Dr. Charles Bentley Buck, Mercedes, Texas, died of coronary thrombosis in a Weslaco hospital December 20, 1953.

The son of Dr. Llewellyn A. Buck and Adelia (Bearce) Buck, Dr. Buck was born November 30, 1869, in Buckfield, Maine, a town named for his ancestors. He received his academic education at Peabody, Kan., and was graduated from old Kansas Medical College, Medical Department of Washburn College in Topeka, which is now the University of Kansas School of Medicine. He served an internship at Christ Hospital, Topeka. Beginning his practice in Abilene, Kan., in 1904, he moved his family to Mercedes, Texas, in 1907. He moved to the Rio Grande Valley after a visit to Corpus Christi, where he became intrigued by tales of the climate and the novelty of the development of the Valley's irrigation systems. Although he engaged in general practice, Dr. Buck had taken special work in anesthesiology in recent years. Forced into semiretirement by his age, he kept office hours until his last illness, which began a week before his death.

Dr. Buck was a member of the American Medical Association and Texas Medical Association through Hidalgo-Starr Counties Medical Society. He was elected an honorary member of Texas Medical Association in 1951. He was also a member of the McAllen Elks Lodge, a charter member of the Mercedes Rotary Club, and a member of the First Presbyterian Church in Mercedes. A veteran of the Spanish-American War, Dr. Buck served in the Philippine insurrection.

Dr. Buck is survived by a son, Robert M. Buck, and a daughter, Mrs. Martha A. McDougall, both of San Antonio, and a sister, Miss Lulu C. Buck, Mercedes, with whom he was living at the time of his death.

L. E. WILLIFORD

Dr. Louis Estes Williford, president-elect of Harris County Medical Society, died at his home in Houston, Texas, January 31, 1954, of coronary occlusion.

The son of Frank and Louise Estes (Hunter) Williford, Dr. Williford was born August 25, 1901, in Houston. He attended Houston public schools, and received academic and medical degrees, the latter in 1927, from Tulane University of Louisiana, New Orleans. He interned at Charity Hospital in New Orleans, and for a year was assistant professor of zoology and anatomy at Tulane. Except for a few years' military service, he had practiced in Houston since 1928.

DR. LOUIS E. WILLIFORD

Dr. Williford was a member of the Texas Medical Association through Harris County Medical Society and would have served as the society's president in 1955. He previously had been chairman of its committee on military affairs. A fellow of the American College of Surgeons and

International College of Surgeons, he also belonged to the Southwestern Surgical Congress and the Southern Medical Association. He served as a member of the board of trustees of the Houston Academy of Medicine and president of the Medical Alumni Association of Tulane University. He was for seventeen years chairman of the surgical staff at Memorial Hospital, Houston, being the youngest man ever to be appointed to that position when he took office in 1937. He belonged to the Houston Country Club, Chambers County Duck Club, and First Baptist Church. Dr. Williford was an enthusiastic sportsman, enjoying hunting and golf especially. He loved fine bird dogs and raised quail.

He was a veteran of World War II, having served with the Army Medical Corps overseas for twenty-seven months and rising to the rank of lieutenant colonel.

September 9, 1940, he married the former Miss LaRue Summit, who had been his secretary for a number of years. She survives as do a brother, Judge Frank Williford, and a sister, Mrs. Frank Hoffman, both of Houston.

J. G. SCHILLING

Dr. John Gaillard Schilling, Houston, Texas, died January 4, 1954, at his home.

Born March 15, 1885, at Cedar Bayou, Texas, Dr. Schilling was the son of Dr. Nicholas and Linna (Gaillard) Schilling. He received his preliminary education at Cedar Bayou public schools and was graduated from the University of Texas Medical School, Galveston, in 1909. He served an internship at John Sealy Hospital, Galveston.

Dr. Schilling practiced at Cedar Bayou for thirteen years before he moved in 1923 to Houston. During World War I, he served with the Army Medical Corps in France for sixteen months.

DR. JOHN G. SCHILLING

A member of the American and Texas Medical Associations through Harris County Medical Society, he was also a fellow of the American College of Surgeons. He was a member of the United States Committee of the World Medical Association and a founder member of the Postgraduate Medical Assembly of South Texas. He belonged to the Southern Medical Association, Association of American Physicians and Surgeons, and Texas Railway and Traumatic Surgical Association. He was a member of the staffs of Methodist, Memorial, and St. Joseph's Hospitals, Houston, serving at one time as president of the staff of Methodist Hospital and vice-president of the staff of Memorial Hospital.

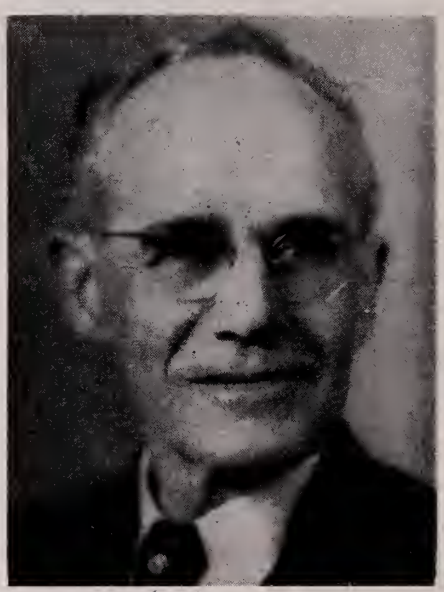
A member of the University of Texas Medical Branch Alumni Association, he also belonged to the Theta Kappa Psi medical fraternity. He was a member of the Houston Chamber of Commerce, Knights of Pythias, and Veterans of Foreign Wars. He also was a Scottish Rite Mason, a Shriner, and member of the Order of the Eastern Star. He belonged to the Presbyterian Church.

Dr. Schilling married the former Miss Fleda Mulligan of Crockett, November 6, 1924, in Houston. Survivors include his wife and one sister, Miss Annie Schilling, Cedar Bayou.

J. E. McCLUNG

Dr. John E. McClung, retired eye, ear, nose, and throat physician of Corsicana, Texas, died of leukemia November 4, 1953, in that city.

The son of Josiah and Sarah (Roberts) McClung, Dr. McClung was born March 5, 1875, in Winona. He received his medical degree in 1897 at the University of Tennessee College of Medicine, Memphis, and practiced in Winona for several years before moving in 1900 to Corsicana, where he settled. Dr. McClung did postgraduate work at the Uni-



DR. JOHN E. MCCLUNG

versity of Tennessee College of Medicine and in 1903 at the Manhattan Eye and Ear Hospital, New York. Later he was on the house staff of the Eye, Ear, and Nose Postgraduate Hospital in New York. The doctor retired in October, 1952.

A member of the Texas Medical Association for many years through the Navarro County Medical Society, Dr. McClung also was a member of the Masonic Order and several local civic clubs.

Dr. McClung's wife, the former Miss Jewel White, whom he married December 5, 1902, in Corsicana, died September 18, 1950. He is survived by two sons, Gerald McClung, Corsicana, and John E. McClung, Jr., New York; one daughter, Mrs. Henry Beckham, Waco; one sister, Mrs. Bess Edwards, and two brothers, Frank McClung and Till McClung, Winona; and four grandchildren.

President's Page

KNOW YOUR COMMUNITY

Doctors as individuals and county medical society members are influential in their communities. This position inculcates them with a special civic responsibility which in order to accept they must know their communities. They should know what facilities, services, and programs are being put to use in their communities and determine the part which can and should be played by the local medical societies for the best accomplishment of these efforts. The best health interest is served by "putting the doctor out in front" as the leader and principal speaker at forums and gatherings pertaining in any way to community medical care.

The Texas Medical Association has produced and distributed to county medical society officers a pamphlet called *Outline Guide, PR Activities for County Medical Societies.* One section of the pamphlet deals with planned participation in community affairs, stressing leadership by doctors in civic agencies dealing with any phase of medical care. Effective and strong community relations add strength to the internal structure of the society itself. You may wish to consider the following questions:

Does your society have an organized program to promote voluntary health insurance? Does it maintain active liaison with insurance underwriters in the city?

Do you have an entirely satisfactory blood bank program?

Do you maintain active liaison with such influential groups as the local Farm Bureau, the Chamber of Commerce, and the various effective trade and professional associations in the city? Does your woman's auxiliary extend this liaison into the federated women's clubs, school health programs, and parent-teacher associations? Could you secure resolutions, if necessary, in support of your views from these groups?

What about your liaison with the American Legion and the Veterans of Foreign Wars? What will be their views in regard to the American Medical Association's position on veterans' medical care?

Do you participate in a local rural health forum?

Has your society screened the sound community projects, and does it take part in a planned manner in those it considers worth while?

Many other projects could be enumerated, but these are mentioned to suggest that a planned committee study of projects, groups, and organizations that need medical leadership in your community is a logical starting point for county society participation.

The President's Page is the closest and most direct contact the President has with each individual member of the Texas Medical Association. I wish here to express my appreciation for having had the opportunity of serving as your President during the past year.

George Tunnell M.D.

PR diagnotes

MAJOR HEALTH LEGISLATION MOVING IN CONGRESS: American Medical Association's alert Washington Office currently reports that there is more action now in Congress on health legislation than at any time in the past few years. More than a dozen public hearings are in process, or scheduled for the immediate future. Hearings began on the administration's reinsurance plan on March 24. Other important administrative bills making progress on Capitol Hill are as follows: Omnibus Tax Revision (H. R. 8300) would, among other things, increase the amount of deductions allowed for medical expenses; it has cleared the House. American Hospital Association has urged that Hill-Burton Expansion (H. R. 8149, S. 2758) be dropped and the Hill-Burton act be amended to include nursing homes and rehabilitation centers. The bill has passed the House; Senate now considering it. Representatives of AMA and Department of Health, Education, and Welfare have been meeting with House committeemen to complete work on Reform of Public Health Grants (H. R. 7397, S. 2778). Senate hearings began April 13. Senate sub-committee hearings began March 30 on Vocational Rehabilitation Expansion (S. 2759). AMA's Washington Office maintains complete files on each bill; can furnish detailed information on request.

SOCIO-ECONOMICS AT ANNUAL MEETING: On the PR side of the annual meeting in San Antonio, May 3 through 5, are two able speakers. William Alan Richardson, editor of Medical Economics, will discuss, "What Makes the Doctor-Patient Relationship Tick" and "Better PR -- the Detour Around Socialized Medicine." Roger Fleming, secretary-treasurer, American Farm Bureau Federation, will speak at the final General Meeting Luncheon, Wednesday, May 5. Fleming, whose Farm Bureau has demonstrated admirable leadership in urging economy and conservatism in government, will discuss what the professions (business, industry, and agriculture) can do in this regard.

The Bexar County Medical Society is utilizing space contributed by San Antonio drug stores in weekly full page advertisements. The society uses drop-in ad space to stress medicine's contributions to San Antonians; one ad, for example, points out that San Antonio doctors provide 12 per cent of

their time to medical care in various clinics for which service they make no charge whatever.

The Memorial Library of the Texas Medical Association is distributing a series of unique bookmarks. They are available on request, and demand is heavy.

County medical societies may shortly expect improved liaison with the Association's central office, when new field secretary C. Lincoln Williston assumes his duties in April. Williston reports from former position as manager of the Office of Public Information of the University of Illinois.

AMA notes that the Houston Chronicle along with three Ohio newspapers deserves special credit for sound medical reporting. The Chronicle was cited for its series, "Versatile -- These Medics" by Elmer Bertelsen, staff science writer.

ON THE NATIONAL SCENE: New York State Medical Society advises effective way to handle complaints bobbing up frequently in letters to editor columns. Observed that much unnecessary controversy may be avoided as in New York counties medical societies' volunteering to investigate complaints received by editors in such letters prior to publication. Have found they can eliminate nearly all, and editors have agreed to print only those found to be justified.

North Carolina societies report use of the many AMA factual pamphlets, such as "A Doctor for You" and "Your Medical Dollar's Worth," as script material for local radio and TV shows. It's a tip for Texas societies which may be looking for such material. The pamphlets are available on request.

The Los Angeles Medical Association is distributing a two-page, printed folder prepared for a local insurance broker. The folder reports a total of 1,645,000 hours of free medical care provided each year by Los Angeles doctors. It clearly points out the staggering administrative costs involved if a government operated program were to replace the present free enterprise system under which this extensive medical care is encouraged.

TIP OF THE MONTH

Has your society begun a new PR project for 1954? If so, PR Diagnotes' readers would like to hear about it, so why not send in a brief report addressed to PR Diagnotes, Texas Medical Association. A newsletter depends on its friends, and your idea may well help others.

ABLE SPEAKERS COMING

Seven guest speakers who together are able to discourse on the whole gamut of medical science, art, and practice will be among the chief attractions on the forthcoming program of the Texas Medical Association's annual session.

ROGER FLEMING

Most recent addition to the list of distinguished speakers to appear in San Antonio, May 3-5, is Roger Fleming of Washington, D. C., secretary-treasurer of the American Farm Bureau Federation, who will deliver the main address at the General Meeting Luncheon concluding the sessions of the Association and its Woman's Auxiliary. His topic, "Let's Get Together," reflects the fact that the independent American farmer and the equally independent American physician share some common problems and views.

Mr. Fleming began working in 1938 with the Iowa Farm Bureau Federation, the second largest state farm bureau, where he remained until 1948, when he became head of the Washington office of the American Farm Bureau Federation. His work in Iowa was interrupted by two and a half years in the United States Navy.

The other guest who is not a physician is William Alan Richardson, Rutherford, N. J., editor of *Medical Economics* since 1933. Mr. Richardson, an experienced newspaperman and financial editor, has lectured on medical economics at the Long Island College of Medicine and traveled extensively on all five continents, making a special study in 1949 of the National Health Service in Great Britain. He will discuss some of the problems of medical public relations with each of the two general sections, A (Medical) and B (Surgical).

Dr. Simeon T. Cantril, Seattle, who will speak to both sections on radiation therapy of certain tumors, has been director of the Tumor Institute of the Swedish Hospital at Seattle since 1938. Active during and since World War II in atomic energy projects, Dr. Cantril is associate professor of radiology at the University of Washington School of Medicine.

Formerly director of the Department of In-

ternal Medicine at the Bowman Gray School of Medicine of Wake Forest College at Winston-Salem, N. C., Dr. George T. Harrell, Jr., recently became dean of the University of Florida College of Medicine at Gainesville. Dr. Harrell was president in 1953 of the Southern Society for Clinical Research, is on the editorial board of *Medicine,* and is a member of the Commission on Chronic Illness. He will bring to Section A (Medical) the result of his research in metabolic problems, emphasizing myxedema and ACTH, cortisone, and hydrocortisone.

Two Denverites will participate in the San Antonio session. Dr. Harold D. Palmer, pathologist and medical director of the Children's Hospital of Denver and associate professor of pathology at the University of Colorado, is accomplished in pathology especially as it relates to pediatrics. He will appear twice on the Section A program. Dr. E. Stewart Taylor, head of the Department of Obstetrics at the University of Colorado School of Medicine, will discuss midforceps operations and endocrine treatment of gynecologic problems for Section B.

The seventh out-of-state speaker invited to take part in the annual session is Dr. Robert L. Sanders, senior surgeon of the Baptist Memorial Hospital, Memphis, and president-elect of the Southern Medical Association. With surgery of the gastrointestinal tract his major interest, Dr. Sanders was recipient in 1953 of the Mississippi Valley Medical Association's award for distinguished service in the teaching and practice of clinical surgery. Dr. Sanders is scheduled to contribute to a symposium on the gastrointestinal tract and to speak on cholecystic disease for Section B.

With the program for the 1954 session being arranged in two concurrent section meetings, it will be possible for more members of the Association to hear all of the guest speakers. Time for questions and answers also has been provided to permit local physicians to query the guest specialists on perplexing problems.

Although the contributions which Texas physicians will make to the scientific program should not be minimized, for some excellent presentations have been arranged, it is anticipated that the guest speakers will offer especially valuable hints to members of the Association, both in their formal addresses and in informal shoptalk throughout their stay in San Antonio.

Concerning the Right to Practice in Texas

It shall be unlawful for anyone to practice medicine, in any of its branches, upon human beings within the limits of this State *who has not registered in the District Clerk's office* of every county in which he may reside, and in each and every county in which he may maintain an office or may designate a place for meeting, advising with, treating in any manner, or prescribing for patients, *the certificate* evidencing his right to practice medicine, *as issued to him by the Texas State Board of Medical Examiners,* together with his age, post office address, place of birth, name of medical college from which he graduated, and date of graduation, subscribed and verified by oath, when, if wilfully false, shall subject the affiant to conviction and punishment for false swearing, as provided by law. The fact of such oath and record shall be endorsed by the District Clerk upon the certificate. The holder of every such certificate must have the same recorded upon each change of residence to another county, as well as in each and every county in which he may maintain an office, or in which he may designate a place for meeting, advising with, treating in any manner or prescribing for patients; and the absence of such record in any place where such record is hereby required shall be prima facie evidence of the want of possession of such certificate.

—Article 4498, Vernon's Civil Statutes, emphasis supplied.

ARE YOU ELIGIBLE?

A doctor who has practiced more than fifty years may feel that he has given all he has to offer to the profession, but this is not so. Even though he may be retired, a doctor who was practicing near the turn of the century still has much to offer his chosen profession. He remembers things happening years ago which may throw valuable light on the problems of

medicine today; he is a recorder of medical history whose firsthand reports should not be lost.

The Fifty Year Club, which any member of the Texas Medical Association who has practiced for fifty years is eligible to join, gives these doctors a chance to get together to reminisce of medicine and methods of treatment in the old days and to make plans for the days to come.

Organized in 1949 by Dr. W. M. Brumby, Houston, the club has no dues and no by-laws. The doctors who have been a part of this group are eager to include more of their colleagues when they meet for breakfast Tuesday, May 4, at 7:30 a. m. in the Gunter Hotel, San Antonio. Any doctor who is eligible should get in touch with Dr. L. H. Reeves, Fort Worth, who is in charge of the breakfast.

A HELPING HAND

While some of his fellow students from Baylor University College of Medicine, Houston, will be on their way to the Texas Medical Association's annual session in San Antonio, John H. Caskey of Waco will be serving in his official capacity as president of the Student American Medical Association. He and other representatives of SAMA's approximately 17,000 members, including students from the University of Texas Medical Branch at Galveston, Southwestern Medical School of the University of Texas at Dallas, and Baylor, will be participating in SAMA's fourth annual convention May 1, 2, and 3 in Chicago.

With a program geared to prepare its members as better students and later as better physicians, the meeting, including deliberations of the policy-making House of Delegates, is open to members of the medical profession, just as the sessions of the American Medical and Texas Medical Associations are open to interested medical students. Both medical students and the practicing doctors should realize the need for each group to see clearly and understand completely what the other is trying to do, for these students will join with today's physicians in comprising the medical profession of tomorrow.

A step in the right direction was the meeting of forty-nine medical students in Chicago in December, 1950, resulting in the organization of the Student American Medical Association and the establishment of its own *Journal,* both with the wholehearted approval and support of the American Medical Association. These students returned to their respective chapters with a constitution to go by and the enthusiasm necessary to gain interest on the local level.

Physicians of Texas were eager to offer a helping hand to the three local chapters. To promote a closer liaison with the future doctors of Texas, Medical Students' Day programs were instituted by the Texas Medical Association in cooperation with the Dallas, Harris, and Galveston Counties Medical Societies. To tighten the bond further, each senior medical student in Texas now receives the TEXAS STATE JOURNAL OF MEDICINE as a gift of the Texas Medical Association, and the Association helps send a delegate from each state SAMA chapter to the American Medical Association's annual session. Also, the entire senior class of the Texas medical schools has been extended a special invitation to attend the state meeting in San Antonio, with student delegates invited to represent the three medical schools in the House of Delegates meetings.

As a group, physicians are lessening the gap between medical students and practitioners, but each individual physician should show his interest in the young men and women who soon will be joining him in the profession. When called upon, he should speak before student groups, be willing to offer advice, share his practical experience on office procedures and the like, and at all times set an example that will add to the prestige of the medical profession.

MEMBERSHIP DIRECTORY PUBLISHED

By the time this JOURNAL reaches the physicians of Texas, they should be receiving the new directory of membership of the Texas Medical Association. Published and distributed by Group Hospital Service and Group Medical and Surgical Service, the Blue Cross and Blue Shield organizations in Texas, the directory was compiled from the 1953 membership list of the Association. It contains not only the names, addresses, and specialties of the physicians but also other pertinent information concerning medical services in the state. Every physician who was a member of the Association in 1953 and returned the directory information card to the central office should receive a directory by May 10. If his copy has not arrived by that date, he is asked to inform the Texas Medical Association, 1801 North Lamar Boulevard, Austin, and one will be sent him.

CURRENT EDITORIAL COMMENT

A CHALLENGE TO LEADERSHIP IN MENTAL HEALTH

Texas physicians cannot afford to ignore the 350,000 persons in this state who are mentally ill to the point of functional incapacity. Of this group 23,000 are completely incapacitated in hospitals, 30,000 are alcoholics, and 1,000 suicides occur annually in Texas. *One of every three* families has a patient sick enough to require hospitalization. Neither the general medical care of these patients nor their specialized treatment will be adequate unless all Texas doctors take an active interest in the operation of the state hospitals.

Improved and progressive professional practices do pay off. With better medical treatment in the state hospital system, a decrease in the average patient stay from 10.5 years in 1950 to 9.4 years in 1952 resulted in an estimated saving of $12,000,000. Aggressive programs can and do transform a tax-recipient patient into a tax-paying citizen.

The mental health movement, climaxed this year during the week of May 2 to 8, exists because of a growing public demand. The medical profession, in the form of Dr. Phillipe Pinel in 1791, took the lead in removing the shackles from the mentally ill and in establishing these illnesses as proper subjects of scientific inquiry and medical treatment. Medicine, because of its more comprehensive training and experience, is better qualified than any other professional group to spearhead further progress.

The serious competition from other groups is inadequately recognized. The existence of this competition is based on increasing demands from the people who are suffering. The public continues to insist that something be done one way or another, and the medical profession has not measured up to its responsibility in this particular area. Mental health problems belong with general health, for the mind and emotions of man cannot be separated from his body. Good treatment is possible only when these aspects are dealt with in relation to the entire human being. A significant question for medicine today is: Will we maintain our leadership through our own efforts and our own merit or will we turn over this leadership to other professional groups by default?

Adequate financial support coupled with politically untrammeled professional leadership and ingenuity would cut the present mental health problem in half without any basic advances in knowledge. The state spends a paltry $2 per day per patient under care, while it is well known that a minimum of $5 per day is necessary for good treatment.

Yet there are just as important and more basic approaches to the problem with which physicians must be concerned. The support for research in this field is appallingly inadequate; in fact only $4.15 is spent per patient under

treatment as compared to $28.20 for poliomyelitis, $26.80 for tuberculosis, and $27.20 for cancer. Despite these handicaps and within the limits of present knowledge, there has been remarkable practical progress; for example, the recovery and improvement rate for schizophrenic patients in seven states has risen from 33 per cent in 1914 to 56 per cent at the present time.

Preventive mental health services are likewise inadequately supported. In a survey of twenty-nine urban communities, one city in Texas spent only 4 cents per capita for such services; four other cities spent this much or less; twenty-four other communities spent more, up to 34 cents per capita. Medical participation in and support of the facilities we do have are gradually but definitely decreasing.

The single most important basic approach is the improvement of psychiatric teaching in medical schools—teaching geared to the broader practice of medicine rather than the specialty. It simply is not sensible, as was the case in 1948, to devote 4 per cent of the teaching time in the medical curriculum to psychiatry while from 30 to 50 per cent of patients seen in practice have important or predominant emotional or mental illness.

DIAMOX

New Oral Nonmercurial, Nontoxic Diuretic for the Treatment of Congestive Heart Failure

GEORGE R. HERRMANN, M. D.; M. RUTH BAXTER, M. D.; M. R. HEJTMANCIK, M. D.; and ALECIA R. MORAN, M. S., Galveston, Texas

THE treatment of patients with congestive heart failure and edema is an everyday job for the practitioner. The problems of the mechanism involved are only partially solved. The failure of the heart muscle probably begins in the abnormal chemistry of the myocardial cell incident to anoxia and to chemical and anatomic changes. The failure of propulsion of the blood results in imbalances and failure of the circulation. The train of symptoms and signs that follow this decompensation are probably the result of reduction of the blood flow through the hypothalamus, pituitary, adrenal, and renal capillaries. The excessive secondary retention of salt and water produces the classical picture. The mobilization and excretion of the edema fluid is the objective of most therapy. Increasing the cardiac output by rest in bed and the improvement of the cardiac tone by the direct effect of digitalis on the heart muscle cells often relieve dyspnea and edema early, but later salt restriction and diuretics are usually necessary.

Xanthines and organic mercurials and combinations of these have been the subjects of our clinical investigations of diuretics during the past twenty years in Galveston. At first we were interested in getting more effective diuretics, but we emphasized the need for less toxic diuretics. Novasural, Salyrgan, and combinations with xanthines such as Mercupurin, Mercuphyllin, Mercuhydrin, and Esidrone were followed occasionally by fatal toxic effects on the heart muscle. A sulfhydryl (monothiol) group then was added and Thiomerin was first released to us. Thiomerin was found to be nontoxic, so nonirritating that it could be injected deep, subcutaneously, and able to produce a brisk diuresis. A host of organic mercurial diuretics were developed for easier administration subcutaneously, by rectum, and orally, but

From the Cardiovascular Service of the University of Texas Medical Branch Hospitals.
Presented at the Universidad de Puebla, Semana Medica, October 5, 1953, Puebla, Mexico.
Supported by the Mid-Texas Twelfth District Heart Association Fund and H. H. Weinert Fund for Cardiovascular Research.

most of these have produced toxic or irritating side reactions and were inconstant in effect or unsatisfactory. Most of them have fallen into disuse, and many have been discarded.

We have always recognized that there has been a definite need for a safe and effective oral diuretic preparation. We were happy to have D. Dale Archer, M. D., and Rutledge Howard, M. D., of the Clinical Research Division of Lederle Laboratories come to Galveston and submit to us their new physiologic, oral, nontoxic, active, nonmercurial diuretic, Diamox, for clinical investigations. Previous studies had established the fact that this carbonic anhydrase inhibitor offered a different and definitely safer approach to the blocking of the reabsorption of sodium through the renal tubular epithelium than that accomplished by organic mercurials.

MODE OF ACTION

Diamox acetoazoleamide, carbonic anhydrase inhibitor 6063 was developed by the Stamford Chemotherapy Division of the American Cyanamid Company and Lederle Laboratories. It is 2-acetylamino-1,3,4-thiadiazole-5-sulfonamide, which is no longer antibacterial (fig. 1). The pharmacology and renal

CARBONIC ANHYDRASE INHIBITOR

SO_2NH_2 GROUP

Fig. 1. Diamox acetoazoleamide, Lederle 6063, 2-acetylamino-1,3,4-thiadiazole-5-sulfonamide.

and diuretic effects of Diamox have been thoroughly worked out by Pitts,[14] Maren,[12] Smith,[17] Friedberg,[3] and others. The imidosulfate group (SO_2NH) has been found to inhibit the carbonic anhydrase enzyme activity specifically and in all tissues. In mammals the carbonic anhydrase inhibitor stops the hydration of carbon dioxide in the blood cells, lungs, tissues, and renal tubular epithelium. With a drop in plasma carbon dioxide content there results a relative acidosis.

Diamox has been reported effectively to block the formation of carbonic acid in the cells of the tubular epithelium of the kidney. This interferes with the production of hydrogen (H) and bicarbonate (HCO_3) ions and the acidification processes, which conserves base. The converting of disodium phosphate (Na_2HPO_4) to monosodium phosphate (NaH_2PO_4) and sodium bicarbonate ($NaHCO_3$) and of amino (NH_3) to augmented ammonia (NH_4) releases sodium, which is excreted as well as monosodium phosphate and sodium bicarbonate.

Diamox, like ammonium chloride, potassium nitrate, or calcium chloride, produces a relative acidosis, but this is not the primary factor in Diamox diuresis. The relative acidosis is accompanied by the urinary excretion of fixed base and the reduction of serum bicarbonate. There is a resulting drop in the hydrogen ion concentration of the blood to 7.25 and carbon dioxide is lost through the lungs. The urinary sodium and carbonate output has been found increased with a decrease in the hydrogen ion concentration as a result of the inhibition of the carbonic anhydrase in the tubular epithelium. Urinary compensatory mechanisms such as augmented ammonia (NH_4) output tend to decrease the sodium and chloride output to some extent, but Diamox has shown little evidence of toxicity and seems to act physiologically.

CASES STUDIED

We have studied the clinical diuretic effects of oral Diamox therapy in 34 hospitalized patients and 23 clinic patients with congestive heart failure. All of these patients presented the classical symptoms and signs of failure of the circulation, dependent edema, and reliable criteria of heart disease, delay in arm to tongue Decholin time and increased systemic venous pressure.

The observations and evaluation of the status of the congestive failure patients and the possibility of toxic reactions were made by the medical resident physicians, Drs. A. P. Thaddeus, James Wright, Clyde Douglas, J. E. Johnson, W. L. Kenoyer, T. V. Rielly, J. S. Lowry, F. L. Sturrock, David Miesch, Virgil Lawlis, Robert Ulmer, O. E. Egbert, Luisa Duesberg, B. F. Montgomery, W. L. Lorentzen, James R. Oates, and Abdul Kerim. This study, as most of our clinical investigation, would not have been possible without their wholehearted cooperation and participation.

Hospitalized Patients

The hospitalized patients were usually in severe heart failure, which had increased in spite of adequate supportive and diuretic therapy. These patients were first stabilized over a twenty-four to forty-eight hour period on their previous digitalis dosage, low salt intake, and rest. Complete history, physical examination, body weight, routine laboratory studies, venous pressure, circulation time, and often blood volume studies were considered. Preliminary control blood studies consisted of measuring nonprotein nitrogen, carbon dioxide, serum proteins, chlorides, sodium, and potassium. A control twenty-four hour urine specimen was obtained and analyzed for sodium, potassium, and chloride content.

Diamox was administered generally in a dosage of

500 mg. each eight hours for 3 doses, then 500 mg. once daily for a week or two in the hospital, and intermittently or regularly for two to fourteen weeks in the clinic. During the first and second twenty-four hour periods after therapy was started, quantitative urinalyses were done for sodium, potassium, and chlorides; after forty-eight hours of therapy the blood studies of nonprotein nitrogen, carbon dioxide, chloride, sodium, and potassium were repeated. Intake and outputs were recorded as well as daily weights, and the extensive daily urinary and weekly blood chemical studies often were continued for ten to fifteen days.

Our patients were about equally divided between Caucasians and Negroes in the 34 hospital and the 23 outdoor clinic patients. There were more than twice as many males as females studied (table 1).

Male	25	16
Female	9	7
Total	34	23

As summarized in table 2, the types of heart disease in these patients were primarily coronary artery heart disease or hypertensive arteriolar disease, which were present twice as often as combined hypertensive

TABLE 2.—*Types of Disease and Ages of Patients Receiving Diamox.*

Rheumatic	5	40-49	17
Syphilitic	7	50-59	10
Congenital	1	60-69	9
Liver disease	2	70-79	13
		80+	3

arteriosclerotic coronary heart disease, syphilitic aortic heart disease, and rheumatic heart disease. There was only 1 case of congenital heart disease in failure, and this was in a middle aged man. Only 5 of the 57 patients in this series were under 40 years of age, and there were equal numbers in each of the decades thereafter from the fifth to the eighth decade.

The hospitalized patients were studied more extensively for two to four weeks. The urinary output volume increased in every case, from a minimum of 32 per cent to a maximum of 450+ per cent and an average of 160+ per cent. The weight losses were from 0 to 31 pounds with an average of 2.31 pounds during the first day, 1.93 pounds the second day and a total of 10.75 pounds for the first week. One patient continued to lose to a total of 60 pounds within two weeks.

The urine chemistry (table 3) showed the sodium excretion increased in each case from 16 to 722 per cent, with an average of 113 per cent. The potassi-

TABLE 3.—*Twenty-Four Hour Urinary Sodium, Potassium, and Chloride Excretion.*

	Na (Gm./24 hr.)	K (Gm./24 hr.)	Cl (Gm./24 hr.)
Before Diamox	.970	0.95	1.62
After Diamox	2.07	1.93	2.85
Average increase	113%	103%	76%

um excretion increased in 17 cases from 6 to 694 per cent, with an average of 103 per cent, but seemingly decreased in 3 cases. The chloride output increased from 6 to 929 per cent with an average of 76 per cent in 16 cases, and seemingly decreased in 4 cases. We believe that in some of our cases the total urine output volumes were not collected. This may account for the apparent decrease in a few cases of the potassium and chloride outputs.

Excessive sodium diuresis produced alkaline urine whereas excessive chloride diuresis produced an acid urine. The taking of the hydrogen ion concentration with nitrazine paper (Squibb) is a fairly practical method of determining the type of electrolyte losses.

The blood serum electrolytes showed on the average only moderate lowering (table 4). Low serum sodium levels developed in 2 patients, both of whom had been on 200 mg. per day sodium intake and had received Thiomerin in full dosage. It should be remembered that such patients are on the verge of electrolyte upsets from the slightest provocation as after even vomiting and diarrhea.

The blood chemistry studies and especially studies of electrolytes before and after Diamox in the hospitalized patients showed the greatest changes or drops in the nonprotein nitrogen and carbon dioxide

TABLE 4.—*Serum Electrolytes in 34 Hospital Patients on Diamox Therapy.*

	CO_2 (mEq./L.)	NPN (mg./100 cc.)	Cl (mEq./L.)	Na (mEq./L.)	K (mEq./L.)
Before Diamox	21.4	47.3	105.0	142.2	4.32
After Diamox	19.05	40.5	102.5	138.2	4.18

levels and in the shifts of the carbon dioxide combining power of the blood. In most instances there were reductions from —0.79 milliequivalents per liter to —9.9 milliequivalents per liter with an average of —3.62 milliequivalents per liter. There were 2 cases in which there was a rise in carbon dioxide content, and in these no diuresis occurred and the drug was presumably not absorbed. The averages are shown in table 4.

The serum sodium level was lowered in 17 cases

from —1 to —19 milliequivalents per liter with an average of —9.2, and rose in 7 cases from +3 to +20 milliequivalents per liter with an average of +8.8. The changes paralleled the diuresis.

The serum potassium level fell slightly in 12 cases from —.3 to —1.2 milliequivalents per liter with an average of —0.73 and rose slightly in 8 cases from +.1 to +0.85 milliequivalents per liter with an inordinate, probably erroneous change of +1.75 milliequivalents per liter in 1 case and, discounting this, an average of +0.29 milliequivalents per liter.

The serum chlorides dropped from a level of —4 to —84 milliequivalents per liter, with an average of —27.8, indicating a moderate loss of chlorides in most instances in which there was a diuresis. In the cases in which ammonium chloride was administered simultaneously Diamox failed twice and the chlorides rose.

The nonprotein nitrogen content of the blood was found lower after Diamox administration in 9 cases, dropping from —1 to —29 mg. per 100 cc. and averaging —13.8 mg. per 100 cc.; it was slightly higher in 7 cases, rising from +1 to +4 mg. per 100 cc. with an average of +2.5 mg. This evidence indicates that the renal function insofar as nitrogen waste excretion was concerned was little if at all affected, and slightly high levels were usually slightly reduced after Diamox diuresis.

The average clinical response in the hospitalized patients was considered excellent in 10 patients, good in 4, fair in 10, and poor in 6. There were no serious toxic reactions following the use of Diamox in these hospitalized patients other than severe nausea and vomiting in 2 patients.

Outclinic Patients

The outclinic patients were our pedigreed cases of chronic congestive heart failure that we have studied for years. They had been maintained in an ambulatory state on low-salt diets, daily digitalis or Gitalin dosage, and mercurial diuretic injections as required 1 to 3 times per week. Most of these patients have been instructed and trained to take care of themselves and are weighed by the special Heart Clinic nurse, Miss Hazel Son.

Twenty-three of these patients were taken off of their routine courses of mercurial and ammonium chloride weekly or twice or thrice weekly injections of Thiomerin (2 cc.) and put on 500 mg. of Diamox daily. In a few the daily dose of 250 mg. of Diamox was prescribed and failed. In 3 cases ammonium chloride was inadvertedly continued. Control determinations of nonprotein nitrogen and urinalyses were repeated at intervals of generally one week. Patients have been followed from one to three months on Diamox therapy.

In this study series of 23 outclinic patients with chronic congestive heart failure there were 11 Caucasians and 12 Negroes, 16 males and 7 females, with 7 in age group 40-49, 5 in 50-59, 3 in 60-69, 5 in 70 to 79, and 3 over 80 years of age.

The etiologic cardiac diagnoses were hypertensive cardiovascular disease in 9 patients, atheromatous diffuse coronary heart disease in 6, combined hypertensive and atheromatous coronary artery disease in 3, and syphilitic heart disease in 4 patients. There was 1 case of rheumatic but none of congenital heart disease with failure treated in this outpatient study.

Two outpatients experienced such severe vomiting after Diamox was administered that 1 had to be hospitalized. The other was given Diamox one week later without even nausea and with an excellent response. One patient complained of numbness and parasthesias; the drug was discontinued and no diuresis developed. In 1 patient the carbon dioxide dropped to 18 volumes per 100 cc. (8.2 milliequivalents per liter), but she tolerated this change well. No other toxic manifestations were noted. Two patients who had shown good response to Diamox in the first course at 500 mg. dosage seemed refractory after two months and began to gain weight. Two patients who had required Thiomerin (2 cc.) three times a week were maintained at their standard weight on Diamox, 500 mg. daily, alone. One patient could not be maintained on Thiomerin alone or on Diamox but responded well to the combination of the two drugs.

The loss in body weight for the first week in patients who responded ranged from 1.5 pounds to 14.5 pounds in 23 instances with an over-all average loss of 4.6 pounds in a week. One of the 3 patients who failed to discontinue ammonium chloride failed to lose any weight, another lost .5 pound, while the third had lost 1 pound in a week.

The clinical response in these outpatients with chronic congestive heart failure to Diamox was considered excellent in 11 cases, good in 6 cases, fair in 3 cases, and poor in 3 cases. Two of the patients with excellent diuretic results were refractory after two and seven weeks of daily Diamox therapy. The mechanism of this possible refractoriness has not yet been established. We shall continue to investigate this important observation.

SUMMARY

In the study of 34 hospitalized and 23 outclinic patients the new oral, nonmercurial diuretic Diamox was found to produce profuse occasionally, but usually moderate diuresis after 500 mg. every eight hours for 3 doses and then 500 mg. daily. A daily reproducible diuresis for six to eight hours after the

routine single daily dose of 500 mg. was produced. Diamox seemed to act physiologically.

A rise in urinary hydrogen ion concentration accompanied by a renal loss of sodium, potassium, and water and probably carbonates or a fall in urinary hydrogen ion concentration and chlorides might result from excessive diuresis. A moderate but satisfactory degree of diuresis often resulted with nothing more than a slight acidosis.

Patients on a 200 mg. per day sodium diet with or without carboresins are usually on the brink of hyponatremia hypopotassemia, and hypochloremia, and their blood may show drops to seriously low sodium, potassium, or chloride levels after severe vomiting or diarrhea as well as after brisk mercurial or Diamox diuresis. Ammonium chloride usually counteracts diamox diuresis and should not be administered before or with Diamox.

Blood and urine chemical and electrolyte studies carried out on most of these patients showed no evidence of any renal irritation effects of Diamox. The nonprotein nitrogen level usually dropped after diuresis and the slight rises noted were insignificant.

The urinary electrolyte shifts showed moderately, grossly correlating changes in the blood serum. The blood electrolyte patterns were grossly upset to the point of production of the syndrome of low serum sodium, hyponatremia, hypokalemia, or hypochloremia in 2 instances. Occasionally a fairly severe acidosis developed, but it has been well tolerated.

The electrolyte patterns in the urine were greatly altered by Diamox. There was usually a great increase in the output of sodium and water, usually also an increased potassium loss and a considerable chloride loss.

Further and more complete electrolyte studies should be carried out to establish firmly the electrolyte shifts. If vomiting, diarrhea, or paresthesia are induced by Diamox, the drug should be discontinued.

The ideal drug for the augmentation of urinary output of sodium has long been sought. We have found that Diamox seems to meet most of the important qualifications of an ideal drug or diuretic. Diamox is usually well tolerated, orally effective over relatively short periods of time, physiologically active, nonirritating, nontoxic, and with no significant side effects. On the other hand, the oral and rectal mercurial diuretics are and may be potentially dangerous, often irritating, and inconstant in action.

Our primary watchword must be absolute safety, and we must demand nontoxicity as more and more diuretics are being developed and submitted for clinical investigation.

The home use of the injectable (sulfhydril protected) mercaptomerins such as Thiomerin has been demonstrated in our clinic to be feasible. Yet this method is not without some danger and the inconvenience of injection. We therefore welcome this as a safe oral preparation in which the ease of administration is not fraught with the danger of high dosage of toxic drugs. Unfortunately 2 patients on continuous daily therapy for two to seven weeks seemed to become refractory or stationary or gained weight.

Fellowships in Industrial Medicine Offered

The Institute of Industrial Health, University of Cincinnati College of Medicine, Eden and Bethesda, Cincinnati 19, is offering three-year fellowships in industrial medicine to physicians who are graduates of class A medical schools and have completed at least two years of hospital training.

More than 2,000 medical journals are abstracted in *Excerpta Medica*. The latter reference work is available in the Library of the Texas Medical Association, as are more than 500 of the periodicals. Access to this information is available to any member of the Association without charge, either by his going to the Library or by writing to its staff at 1801 Lamar Boulevard, Austin.

Clinical Studies of Dicurin Procaine (Lilly) and of SU-1775 (Ciba)

M. RUTH BAXTER, M. D.; M. R. HEJTMANCIK, M. D.; and G. R. HERRMANN, M. D., Galveston, Texas

PATIENTS with congestive heart failure and waterlogging edema are still and probably will be always major problems in cardiac therapy. Since the crux of the situation is abnormal myocardial cellular function, the ultimate solution must be directed at favorably influencing the chemistry of the heart muscle. Some present-day therapeutic efforts with digitalis and the coronary vasodilators are directed toward this accomplishment.

Control of the body electrolytes by restriction of sodium and use of diuretics is a major part of the treatment program. As more and more diuretics have been introduced, our interest has been centered on the development of safer, less irritating, and less toxic, rather than more powerfully active, drugs. To this end we first studied and introduced Thiomerin, in which a sulfhydryl monothiol group protected against acute mercury toxicity on the heart muscle.

We have given thousands of injections of Thiomerin without a single severe or serious reaction, and have taught 50 clinic patients to inject the drug subcutaneously at home two to three times a week and report back to the clinic weekly or every two weeks. In none of these patients have there been any severe reactions.

Even with the present armamentarium, development of occasional refractoriness to therapy and pain on injection in certain patients make it desirable to evaluate new diuretics as they are developed. We have tried the various oral and rectal mercurial diuretics and found none uniformly satisfactory in tolerated doses. The larger doses of mercurials are not without danger.

In the past eighteen months we have studied the therapeutic and side effects of two more organic mercurial compounds—Dicurin Procaine, sent to us by Eli Lilly and Company, and SU-1775, submitted by Ciba Pharmaceutical Products. These are both for subcutaneous administration.

Only patients with edema, generally due to chronic congestive heart failure, were selected for this study. They were first carefully evaluated, after reviewing the history, with physical examination, electrocardiogram, and routine laboratory studies, including urinalysis, nonprotein nitrogen content of the blood, and complete blood count. These examinations were repeated at frequent intervals throughout the study. The mercurial was given in 1 to 2 cc. doses subcutaneously, and a careful record was kept of the urinary output for twenty-four hours in all cases and in many cases for the following two twenty-four hour periods. Weights were obtained as often as possible to study the diuretic effect after each injection.

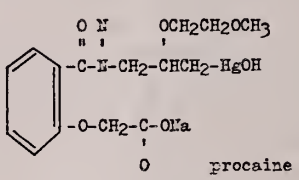
DICURIN PROCAINE (LILLY)

The structural formula of Dicurin Procaine is shown in figure 1. It contains 10 per cent organic mercurial compound as a complex procaine salt with 5 per cent theophylline, and each cubic centimeter



37 mg. Hg/cc.

FIG. 1. Dicurin Procaine.

contains approximately 37 mg. of mercury. It is furnished in 2 cc. ampules already in solution. One great advantage is its stability when stored at ordinary room temperature; it requires only protection from sunlight.

Study by other investigators[3] of the diuretic action in anesthetized dogs showed the diuretic potency of Dicurin and Thiomerin to be approximately the same. One group found the medial lethal dose of Dicurin Procaine in rats by intramuscular injection to be approximately 12.7 mg. of mercury per kilogram of body weight, and the medial lethal dose of Thiomerin to be approximately 18.7 mg. of mercury per kilogram.

Analysis of Patients.—A total of 264 injections of Dicurin Procaine was given to 52 patients, the number varying from 1 to 14 per patient. The majority of these were out-patients, 47 being seen in the Heart Clinic and 5 in the hospital. There were 32 males and 20 females, the number being equally divided between Caucasian and Negro. Three of the patients were in their thirties, 8 in their forties, 8 in

their fifties, 14 in their sixties, 15 in their seventies, while 4 were more than 80 years of age. All the patients had chronic congestive heart failure, the cause being hypertensive in 9 cases, arteriosclerotic in 21 cases, hypertensive and arteriosclerotic in 11 patients, rheumatic in 3 cases, syphilitic in 6 cases, and chronic cor pulmonale in 2 cases.

Reactions.—Of these 264 injections, 16 resulted in local reactions and 2 were accompanied by systemic reaction. The local reactions occurred in 9 of the 52 patients, and the 2 systemic reactions were experienced by 1 patient. Nine injections caused pain or tenderness lasting more than twenty-four hours, 6 caused subcutaneous induration, and 2 resulted in ecchymoses. The ecchymotic reactions all occurred in women, as noted in the studies by Best[1] and his group, but not all in elderly women as in his series. The local reactions were distributed as follows: 3 in 3 female patients with arteriosclerotic heart disease, 3 in 1 male patient with hypertensive cardiovascular disease, 2 in 1 female patient with arteriosclerotic and hypertensive cardiovascular disease, 2 in 1 male with syphilitic heart disease, 2 in 1 male with undiagnosed type of heart disease, and 4 in 2 females with rheumatic heart disease. One of these females had as well 2 systemic reactions, which will be described later.

Reactions in 3 of the patients were severe enough to necessitate the discontinuance of the drug, one at the patient's request because of subcutaneous nodules, which she had not experienced with injections of other diuretics. The other 2 cases will be described in detail.

CASE 1.—A.V.D., a 77 year old white woman with arteriosclerotic heart disease and chronic cardiac decompensation, had previously been well maintained for a long period on weekly Thiomerin injections, with no reactions. She was given 2 injections of Dicurin, which she tolerated well. The third injection was followed almost immediately by severe local pain and produced marked tender induration and ecchymosis. A fourth injection was given, and about two hours later an area of hyperemia and swelling about 5 cm. in diameter appeared. The patient had a low grade temperature elevation the rest of the day and that night, and a week later a large bluish residual about 10 or 11 cm. in diameter was still present. We skin-tested the patient with 0.1 cc. of Dicurin, and the skin test was markedly positive showing wheal formation with surrounding erythema. A skin test with procaine alone was negative.

CASE 2.—D. B., a 33 year old white woman, had rheumatic heart disease with chronic congestive failure. After her third and fifth injections of Dicurin she had systemic manifestations, similar on both occasions: she felt weak, had a hot, dry feeling in her throat, and felt as though she would faint. These symptoms lasted about an hour. Her skin test with Dicurin was negative. She had had no similar symptoms with many injections of Thiomerin.

In 4 of our patients, nonprotein nitrogen values later rose to pathologic levels, but other factors were causative and none of the high values could be ascribed to Dicurin. There was no instance of irritation of the kidney by Dicurin as shown by urinalyses after the injections.

Clinical Diuretic Results.—The diuretic effect of this drug was found to be satisfactory, the average urine output being 2,949 cc. during the first twenty-four hours following an injection, 1,658 cc. the second twenty-four hours, and 1,115 cc. the third twenty-four hour period. The average weight loss the first twenty-four hours in the hospitalized patients was 4 pounds; the second twenty-four hours, 0.8 pound.

SU-1775 (CIBA)

The structural formula of SU-1775 is shown in figure 2. It is an aliphatic compound with a sulfhydryl group and contains 25 mg. of mercury per cubic centimeter. In 1945 Volini[5] reported 3 deaths following intravenous administration of mercurial

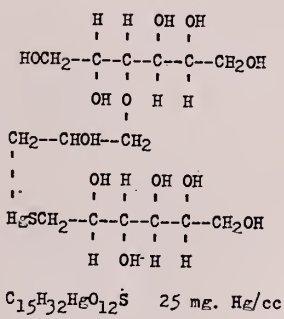


FIG. 2. SU-1775.

diuretics, 1 after Mercupurin and 2 following Esidrone. Esidrone was removed from the market in the United States, although it is still being used in Mexico. By the addition of the sulfhydryl group, the cardiac toxicity of Esidrone has been corrected and alleviated in SU-1775, as shown by electrocardiographic studies following intravenous administration in experimental studies, apparently with retention of the powerful diuretic effect.

Extensive animal experiments have been performed by other investigators[4] with SU-1775 with regard to cardiac toxicity, renal effects, and intracutaneous irritation. In these studies it has been shown to compare favorably with Thiomerin.

Analysis of Patients.—A total of 308 injections of SU-1775 was given to 60 patients, the number varying from 1 to 40 per patient. Of these 48 were outpatients and 12 were hospitalized. There were 39 males and 21 females, 29 being white and 31 being Negro. One patient was less than 29 years of age, 5 patients were in the 30-39 age group, 7 in the 40-49

group, 9 in the 50-59 group, 16 each in the 60-69 and 70-79 age group, while 6 were past 80 years of age. Most of the patients were edematous from chronic congestive heart failure, the cause being arteriosclerotic in 21 cases, hypertensive in 15 cases, arteriosclerotic and hypertensive in 8 cases, rheumatic in 4 cases, and syphilitic in 6 cases. One patient had heart failure which occurred a few weeks postpartum, the exact cause being unknown. Four patients had edema from portal cirrhosis and 1 from varicose veins.

Reactions.—Seven of the 308 injections were accompanied by local reactions, occurring in 5 of the 60 patients. There were no systemic reactions. Two injections caused pain or tenderness lasting more than a day, 5 caused subcutaneous induration, and 2 resulted in ecchymoses. Ecchymotic reactions were not limited to females in this series; 1 of the 2 patients was a male and the other a 33 year old woman. There were 2 local reactions in 1 male with hypertensive cardiovascular disease, 1 in a male with arteriosclerotic heart disease, 2 reactions in a male and 1 in a female with combination arteriosclerotic and hypertensive cardiovascular disease, and 1 local reaction in a female with rheumatic heart disease. None of the reactions was severe enough to cause the drug to be discontinued.

The nonprotein nitrogen content of the blood did not rise to pathologic levels during therapy in any of the patients. However, in 2 patients, both of whom had evidence of urinary tract infection both before and after the diuretic, the red blood cells in the urine rose from zero or occasional to 2 to 4 per high power field.

Clinical Diuretic Results.—The diuretic effect of this drug was found to be extremely satisfactory, the average urine output being 3,272 cc. during the first twenty-four hours following an injection, 1,631 cc. the second twenty-four hours, and 975 cc. the third twenty-four hour period. The average weight loss was 4.2 pounds the first twenty-four hours in the hospitalized patients and 2.4 pounds the second twenty-four hours. This is more of a diuresis than we have gotten in other diuretic studies[2] without ammonium chloride, and the amount of mercury in each dose is only about two-thirds of that in other mercurials.

DISCUSSION

From these preliminary studies with the two new mercurial diuretics, we do not feel justified in drawing any final conclusions. Only continued use over a long period in many patients could demonstrate superiority of any new product over the relatively safe and effective mercurials already on the market.

Dicurin Procaine appears to be an effective diuretic which has not produced renal toxic effects in our patients. It has the advantages of being dispensed in a stable solution and not requiring refrigeration. This is particularly valuable in self-administration at home and also saves time in the office. However, even in this small series, there has seemed to be an unduly high percentage of severe local and systemic reactions. We have not seen such reactions in several thousand Thiomerin injections and believe that these undesirable side effects may limit the use of Dicurin Procaine. Such severe reactions were not observed by Best and others[1] in 540 injections to 69 patients. However, these investigators noted a reaction occurred in about one-fifth of the patients, and 8.15 per cent of the injections. In our series local reactions occurred in fewer than one-fifth of the patients, and 6.8 per cent of the injections.

The reactions observed from SU-1775 were less frequent, and none was severe. They occurred in not quite one-tenth of the patients and 2.3 per cent of the injections. SU-1775 is an effective mercurial diuretic, well tolerated by the patient, and compared favorably to Thiomerin. This compound contains only 25 mg. of mercury per cubic centimeter in comparison to 37 mg. of mercury per cubic centimeter in Dicurin Procaine and 40 mg. of mercury per cubic centimeter in Thiomerin. In 2 patients with renal infection there was a slight increase in red blood cells in the urine following SU-1775, but no increase in nonprotein nitrogen. This may well not have been due to the diuretic, but more studies must be made before this point can be evaluated. SU-1775 is dispensed in a lyophilized form in 2 cc. ampules, which must be put in solution with distilled water immediately before using. It is stable for only a few days after being placed in solution. Its administration thus involves additional time consuming steps; however, this difficulty probably can be overcome by refinements in its preparation.

SUMMARY

The clinical effects of two new mercurial diuretics were studied in hospital and clinic patients over an eighteen month period.

Dicurin Procaine, a complex procaine salt with 5 per cent theophylline was effective in 264 injections given to 52 patients. However, it caused local reactions in 9 patients and 6.8 per cent of the injections, and systemic reactions in 1 patient and 1.9 per cent of the injections. In 2 cases reactions were severe. The average urinary output in the first twenty-four hours after injection was 2,949 cc. and average weight loss 4.0 pounds. Dicurin Procaine has the advantage of being dispensed in a stable solution and not requiring refrigeration.

SU-1775 is an aliphatic mercurial compound with a sulfhydryl group. In 308 injections given to 60 patients the clinical diuretic results were excellent. The average urinary output in the first twenty-four hours after injection was 3,272 cc. and average weight loss 4.2 pounds. Local reactions occurred in 5 patients and 2.3 per cent of the injections. There were no systemic reactions and the local reactions were not severe.

Neither diuretic produced any definite demonstrable signs of renal toxicity.

Further studies will be necessary before the place of these compounds in modern diuretic therapy can be determined. However, SU-1775 seemed to be nontoxic and more effective than other mercurials that we have studied.

TREATMENT OF CYSTIC HYGROMA

JAMES A. MARTIN, M. D., Dallas, Texas

SINCE the first case of cystic hygroma was reported by Redenbacher in 1828,[1] there have been 250 or more additional case reports of this rather rare lesion in the world literature. Opinions as to proper treatment have varied greatly from one author to the next, and there is generally at present an inclination in favor of surgical excision. One often encounters the unqualified dictum that all such tumors are treated best by primary removal[3] and that they are radioresistant.[17]

The term cystic hygroma means "moist tumor" and implies an infiltrating multilocular tumor containing endothelial lined spaces and usually arising within the neck or axilla of a child. The cysts are usually thin walled with or without intercommunication and contain a serous or turbid fluid, having the consistency of lymph. Most popular among the theories of origin is that of embryonic sequestration of lymphatic channels from the primitive lymph sacs early in fetal life.[8, 11] This tissue apparently maintains its properties of growth and lymph secretion although isolated from the mother system, and endothelial fibrillar sprouts from walls of marginal cysts readily penetrate adjacent tissues. Lymphlike fluid produced within the fibrillae leads to the formation of cysts which enlarge, and eventually pressure atrophy within the walls of adjoining cysts may allow confluence and the formation of larger cysts. Adjacent tissues may be engulfed by the infiltrating process and destroyed by direct atrophy and fatty degeneration, thus accounting for the frequent finding of muscle, fascia, nerve filaments, and vascular structures within the walls of the tumor.[4]

Read before the Section on Radiology, Texas Medical Association, Annual Session, Houston, April 28, 1953.

Many hygromas are present at birth, whereas most of the remainder make their appearance within the first few years of life. Growth rate is often erratic and variable with some tumors which have remained small for some time abruptly increasing rapidly in size for no obvious reason. In other instances an increase in size may be associated with infection or alteration of intrathoracic dynamics, such as occurred in one of Figi's cases in which recurrence of a cervicomediastinal mass apparently was allied to the cough of pertussis.[2] The greatest majority of tumors have occurred in the neck from which they can extend superiorly into the floor of the mouth, cheek, and tongue or inferiorly beneath the clavicle into the axilla, into the mediastinum, or onto the chest wall. It is considerably less common to encounter isolated lesions within the mediastinum, axilla, or inguinal region. Secondary infection is by far the most drastic complication with secondary septicemia and toxemia accounting for a large percentage of fatal incidents regardless of the treatment employed. It is doubtful if fibrosis following sepsis accounts for spontaneous improvement in any but rare instances, and there is no justification for reliance on such a sequence of events for a possible cure.[5]

In spite of the lesion's infiltrating properties pain is seldom associated with a hygroma clinically, except rarely when there happens to be deep extension from the neck posteriorly to involve the brachial plexus. Mediastinal extension often produces tracheal and esophageal deviation, but only rarely are pressure symptoms associated. Isolated lesions in the mediastinum are generally asymptomatic and often are detected only by accident in an older age group by a routine chest roentgenogram or at autopsy. Fluid

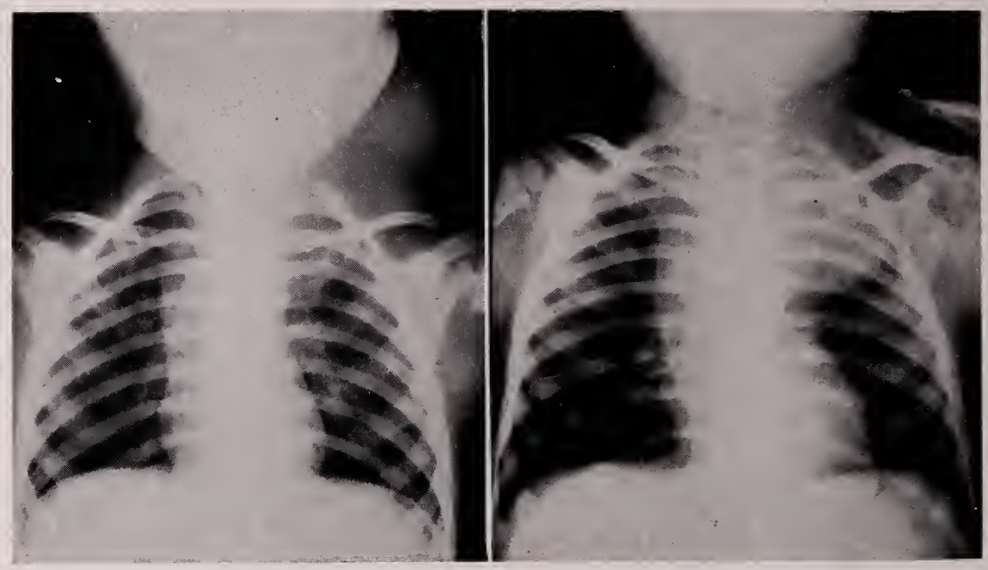

FIG. 1. A cervicomediastinal cystic hygroma. Pressure on the cervical component forced most of the mass into the chest. [From The Children's Medical Center in Boston. After Gross, R. E., and Hurwitt, E. S.: Cervicomediastinal and Mediastinal Cystic Hygromas, Surg., Gynec. & Obst. 87:599-610 (Nov.) 1948.]

contained within the cysts is usually not under pressure and clinically the tumor presents a consistency of semifluctuance without stretching of the overlying skin. In the neck one must differentiate this from thyroglossal cysts, branchial cleft cysts, lipomas, and hemangiomas. It has been said that a characteristic of hemangiomas is the "sign of emptying." One should remember, however, that pressure on a branchial cleft cyst can force it to empty into the retropharyngeal space,[16] and in one instance at least, pressure on a cervical hygroma has "emptied" the neck, so to speak, with reduction of most of the mass into the thorax (fig. 1). In the mediastinum an isolated tumor presents no pathognomonic radiographic changes and must be differentiated from other mediastinal masses including pericardial celomic cysts. In general, however, the proper diagnosis can be arrived at clinically without undue error whenever a cystic mass is apparent in the neck or axilla, fitting the general description previously given.

CLINICAL MATERIAL

Nine cases are presented in which semifluctuant cystic tumors of the head, neck, and axilla were treated primarily with irradiation. Of the children 6 were girls and 3 were boys. Some patients received radium applicator therapy, similar to the technique described by Figi, employing one or two 50 mg. capsules, having equivalent filtration of 1.5 mm. of brass and fixed to a balsam wood block so that treatment is administered at a distance of 2.0 cm. Other patients often received 200 to 220 kilovolt roentgen-ray therapy as a supplement or as the only treatment. It is possible that the small lesions limited to the cheek may not have represented true hygromas since reports of such lesions are relatively rare. Nevertheless, they were cystic tumors, apparently lymphangiomatous in nature, occurring in young children and not fitting well the general description of lipoma or hemangioma. There were 3 of these lesions, 2 of which regressed completely under treatment. The other lesions involved the neck or supraclavicular fossa and in one instance extended into the axilla. Seven of the 9 patients are considered to have responded satisfactorily to treatment, whereas the other 2 (cases 8 and 9) are classified as failures. Of the former group 3 required plastic surgical repair after treatment, in 2 instances to remove redundant skin folds, and in the third to excise small residual thick walled cysts. There is 1 case in which radiation produced an abnormality in development, the seriousness of which was predominantly of a cosmetic rather than functional nature. There were no deaths and no recurrences, and secondary infection was not a severe complication in any case.

CASE REPORTS

CASE 1.—S. K., a 26 month old girl, had a slow-growing tumor of the left side of the neck, first noticed by her parents when she was 2 months old. In the two weeks preceding admission of the child to the clinic, the tumor for no apparent reason grew rapidly and doubled in size, without producing any pressure symptoms. At the time of initial examination on February 3, 1951, it was observed to be a large semifluctuant cystic mass, extending from the mandible to the clavicle and crossing the midline anteriorly. Some bluish discoloration of the lower portion of the mass suggested recent bleeding (fig. 2). External radium treatments were given to the upper portion of the tumor, using a 50 mg. applicator at a 2 cm. distance, with a fourteen hour exposure to each of seven adjacent areas over its

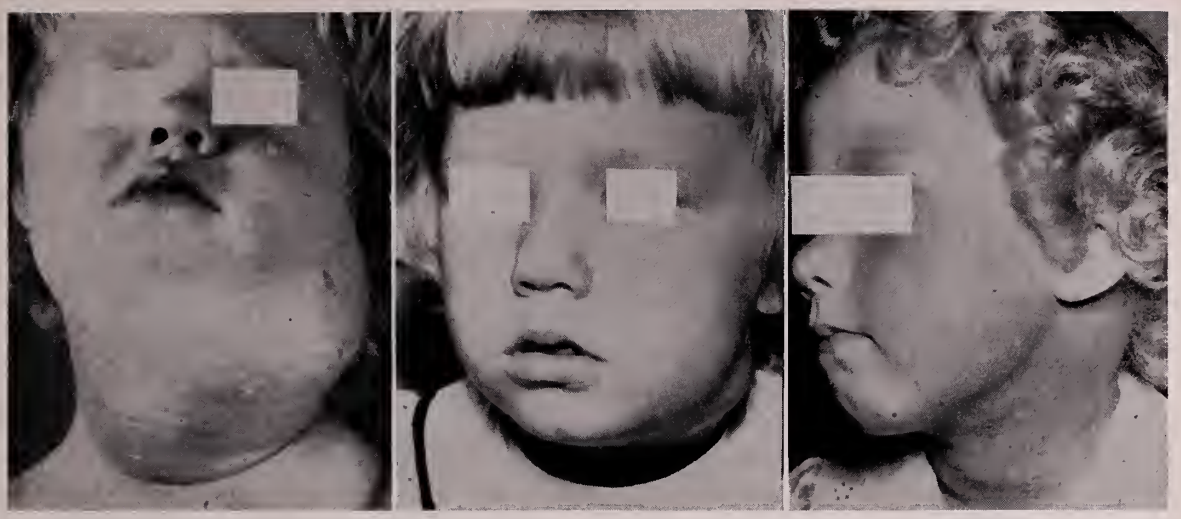

FIG. 2. Case 1. *Left.* A 26 month old girl with a large semi-fluctuant hygroma in the neck. *Center.* The same child seventeen months later showing marked reduction in size of the tumor following irradiation. *Right.* Final result one month later, shortly after excision of small residual thick-walled cysts.

surface. The tumor showed only minimal shrinkage over the next four month period, and on June 2, fractionated roentgen-ray therapy was initiated through a single lateral 10 by 10 cm. field, and a total dose of 1,800 r (air) was delivered in seven days. Other factors were 200 kilovolts, focal surface distance of 50 cm., and filtration of 0.5 mm. copper and 1.0 mm. aluminum. Following this there was considerably more reduction in size, such that only 2 small isolated cystic lesions remained seven months later. Each of these was treated in January, 1952, through a circular cone, having a 7 cm. diameter, with a dose of 1,200 r (air) delivered to each area in five days. Further shrinkage took place gradually over the next six months. During this interval some transient enlargement of the upper cyst occurred concomitantly, with a fever following multiple mosquito bites, but the lesion promptly was reduced in size again following penicillin therapy. On July 7 the remaining cysts were excised and described as being thick walled without recognizable lining and containing hemorrhagic fluid. The patient recovered promptly from this operation and has remained well.

CASE 2.—D. B., a 4 month old girl, was initially seen on October 10, 1932, with a soft cystic mass arising in the right lower part of the neck and measuring about 5 inches in length and 4 inches in diameter (fig. 3). This had been present since birth and had not undergone any change in shape or size, nor had it caused the child any obvious discomfort. Two 50 mg. radium capsules in a pack were applied, at a 2 cm. distance, for fourteen hours to each of three areas over the tumor on each of three consecutive days. Over a three month period the mass was reduced in size by about one-half. On February 13, 1933, a single fourteen hour application to the center of the tumor was given with the same pack. Six months later the tumor was reduced to a flat structure, encased in a sac of loose skin, and a final single fourteen hour application was administered. The patient was seen again seventeen years later, at which time it was noted she had remained well without recurrence of the tumor although the overlying skin still hung in rather unsightly folds. At present, she is under the care of a plastic surgeon and has recently undergone preliminary excision of the major portion of the skin sac.

CASE 3.—B. L., a 6 weeks old boy, was originally seen on December 23, 1946, with a large cystic mass measuring roughly 7 by 8 cm. in the right side of the neck (fig. 4). This tumor had been present, without remarkable change in size, since birth and did not produce any obvious embarrassment to adjacent structures. Fractionated roentgen-

FIG. 3. Case 2. *Left.* Appearance of a cervical hygroma at the time of the patient's initial treatment in 1932. *Center.* The same patient as seen in 1950 showing complete regression of the tumor leaving redundant skin folds in the area. *Right.* The appearance in 1953 shortly after initial plastic procedures were started.

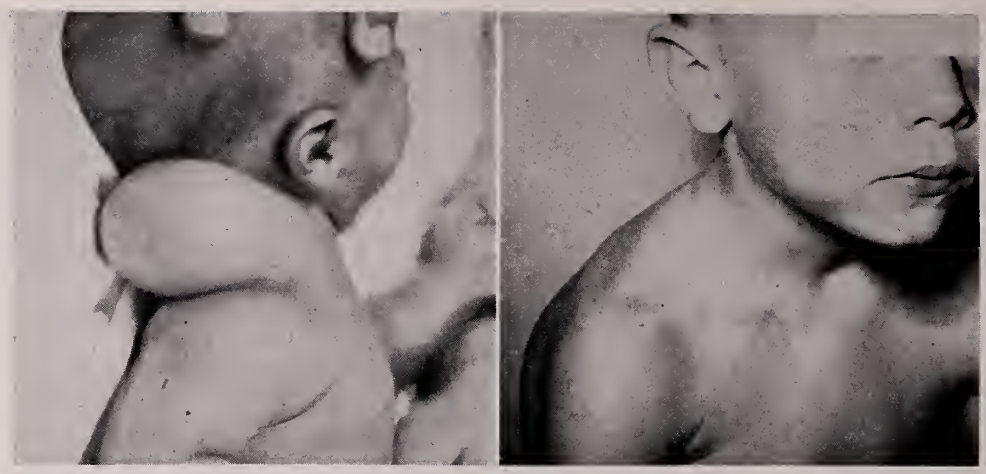

FIG. 4. Case 3. *Left.* A large hygroma in the right side of the neck of a 6 week old infant. *Right.* Six years later the tumor had completely regressed and the excess overlying skin folds had been removed surgically.

ray treatment was administered, cross-firing through two tangential 10 by 10 cm. fields and delivering in twelve days 1,032 r (air) anteriorly and 1,040 r (air) posteriorly. Other factors were similar to those in case 1. Over the next three months slow shrinkage was noticed, and at the end of that time the mass was considered to be one-third of its original size. On March 27, 1947, a second, shorter series was administered to the residual mass, employing the same treatment factors, and delivering 900 r (air) in five days through a round cone 7 cm. in diameter. One month later only a small remnant of the tumor could be felt within the overlying skin folds, and the patient was referred to a plastic surgeon for excision of this excess skin. This was performed in October, 1947, and the wound healed without consequence. The patient was last seen March 7, 1953, a little more than six years following his initial treatment, with a tiny area of induration beneath the lower extremity of the surgical scar but no evidence of recurrence.

CASE 4.—W. G. C., a 3 year old girl, was admitted to the clinic on January 6, 1930, nine months after a puffy tumor was first noticed over the left temporal region. Clear fluid was aspirated from the mass, but it continued to increase slowly in size and eventually extended over the cheek into the neck beneath the ear without causing her any discomfort. The upper portion of the lesion measured 1.25 inches in diameter, and the lower portion was 3 inches across. Heavily filtered 100 mg. radium packs were applied at 2 cm. to each of four areas over the tumor, for fourteen hours each, and this was repeated ten days later. Three months later the mass was reduced to a diameter of 2 inches, and the therapy was repeated. There was continued reduction in size, and with 2 more smaller applications the mass was found reduced to a small cyst ten months after the first consultation. The patient was last seen in April, 1953, at the age of 26 years, with only slight fullness of the left side of the face, with no disability and no visible asymmetry of development.

CASE 5.—B. A. S., a 5 year old girl, was referred to the clinic on May 31, 1937, with cystic masses in the right axilla and supraclavicular fossa. The axillary lesion was observed six months after birth, but the supraclavicular mass was first noticed eight months before this visit when

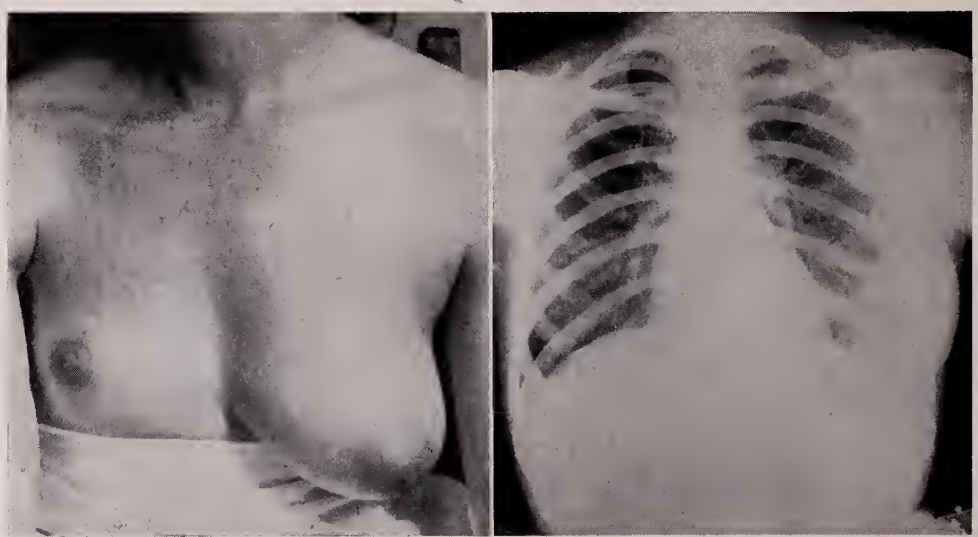

FIG. 5. Case 5. *Left.* Considerable reduction in the amount of subcutaneous tissue about the right shoulder girdle and delayed development of the right breast about sixteen years after irradiation therapy to a hygroma of the axilla and supraclavicular fossa. *Right.* Chest roentgenogram of the same patient showing shortening of the right clavicle.

its rapid increase in size became obvious. Partial excision of the axillary lesion was performed two weeks previously, and a histologic diagnosis of cystic hygroma obtained on a mass of tissue described as being the size of a man's fist. The residual axillary mass measured about 2.5 inches in diameter, while the palpable supraclavicular mass was 1.5 inches across. Roentgen-ray treatment was given through a single anterior 15 by 15 cm. field covering both areas and including most of the right pectoral region. A total dose of 2,000 r (air) was delivered in eight days, employing 220 kilovolts, 50 cm. focal surface distance, and a filter of 0.8 mm. tin, 0.25 mm. copper, and 1.0 mm. aluminum. In a period of two months both lesions regressed, leaving only a single movable 1.0 cm. node, which persisted unchanged low in the axilla over the next four years and to the present. The patient was not seen again until April 11, 1953, at which time she was well, without evidence of recurrence, but exhibited evidence of retarded development of the right shoulder girdle and breast, undoubtedly late results of irradiation therapy (fig. 5). There was no associated functional or psychic disability.

CASE 6.—J. H., a 4 month old girl, was originally seen on July 20, 1931. About two months previously her mother first noticed asymmetry of the child's face, and a 2 inch soft tumor was discovered in the left cheek. A single fourteen hour application of the 100 mg. pack was given, and two months later a second application of a 50 mg. pack was made for fourteen hours. The patient is now married and the mother of a healthy infant. There is no evidence of a cyst in the left cheek, and the skin texture is good. Roentgenograms of the mandible show a symmetrical bony development and average dentition.

CASE 7.—C. C., a girl, was first seen at the age of 18 months, with a soft cystic mass, measuring 2 inches in diameter, in the left parotid area. The patient had been under a dermatologist's care for several months for a tumor within the lower lip which had responded well to carbon dioxide snow. On April 20, 1942, a 100 mg. radium pack was placed over the tumor of the cheek for fifteen hours. About five months later the tumor was reduced to a single cystic area measuring .75 inch in diameter, and a second radium application was given with the above applicator for sixteen hours. The patient was last seen March 14, 1953, at which time the mass had completely disappeared. The overlying skin was soft and elastic, and development of the face and teeth had been symmetrical.

CASE 8.—B. L., a month old boy, was originally seen on May 5, 1936, with a soft cystic mass in the left side of the neck. This mass had been observed at birth as "lemon-sized" but since then had enlarged itself fourfold and extended down over the back. A 50 mg. radium pack was applied at 2.0 cm. for fourteen hours to each of four areas over the lesion. Re-examination in two and a half months revealed little change, and the same application was applied to each of two areas. After another interval of three months there was no significant change, and the treatment was repeated to two areas with sixteen hour applications each. On February 6, 1937, a 100 mg. applicator was placed for twelve hours to each of two areas, again without producing any appreciable effect upon the tumor. One year and three months after the initial visit a total dose of 2,400 r (air) was administered in nine days through a single posterior field over the mass employing roentgen rays at 200 kilovolts and treatment factors as in case 1. The child's family then moved, and it has not been possible to determine his subsequent course or present status.

CASE 9.—W. R. D., Jr., was seen on January 27, 1948, at the age of 15 months, with a cystic soft tissue mass within the right cheek slightly narrowing the right palpebral fissure and partially obliterating the right nasolabial fold. This lesion was first observed about forty-eight hours after birth and was described as diminishing slightly in size within the next two months but not changing appreciably afterward. Roentgen-ray therapy was administered through a single lateral 10 by 10 cm. field, with an air dose of 1,450 r delivered in seven days. Treatment factors were the same as in case 1. The lesion was slightly smaller when seen two months later but had increased again in size at the final visit seven months after treatment. The child has not been seen since, but a member of the family states the tumor is still present, although somewhat smaller than when first seen. He apparently has had one episode of superimposed infection within the last year requiring hospitalization but readily controlled with penicillin.

CONCLUSIONS

It appears rather shortsighted to say that only one method of approach to a problem is reasonable, when several are tried and available. It has been established that a number of cystic hygromas are remarkably radiosensitive,[2,7,12,13] but this does not imply that irradiation is the best attack in all instances. Likewise, it has been proved that even the infiltrating tumors of the neck and mediastinum can be eradicated successfully by one or more skillful surgical procedures with or without the use of sclerotics in destroying the endothelium of nonresectable fragments.[5,6,7,16] Incomplete removal, however, invites recurrence, and a difficult operation implies a certain rate of complication and mortality. Exponents of surgery have quoted the figures of Figi[2] pointing out the mortality of 7 out of 13 patients, but they have overlooked the fact that these deaths were from secondary infection in children considered inoperable and that all other patients benefited by radium treatment. Those supporting radiation therapy, on the other hand, might quote the figures collected from the literature by Dowd[1] in which surgery accounted for 40 cures while allowing 39 deaths. It is easy to overlook the fact that these deaths were also generally from sepsis in an era before bacterial chemotherapy was available.

Objectively speaking, I believe that the drawbacks of surgical attack include the difficulties of adequate dissection in the infiltrating lesions and thus the possibility of incomplete removal and later recurrence or the possibility of inadvertent damage to vascular and nervous structures. Of less frequent importance are the chances of postoperative sepsis and mortality. A small localized and easily excised lesion might be treated surgically by preference and a good result obtained in a relatively short time. The isolated mediastinal lesion is primarily a surgical problem due to the present limitations in its preliminary diagnosis.

The major drawback of radiation therapy is that the response is relatively slow and the treatment and follow-up periods are likely to extend over a number of months. Occasionally, surgery must be performed at the end of a treatment course anyway, in the form of plastic repair or excision of a remnant cyst or cysts and as a form of treatment in a tumor which proves to be radioresistant. There is usually, however, little real hazard in performing these plastic procedures. Theoretic objections to radiation stem from disastrous experiences with growth irregularities in the past when radiation was given indiscriminately over growth centers. Oddly enough, there is a significant void of any such reports in the literature concerning cystic hygroma although it is likely that longer follow-up reports in some instances might disclose a few growth irregularities that have previously escaped detection. The danger of secondary infection apparently will not be the serious problem it once was before chemotherapy was available.

SUMMARY

In spite of some general opinion that the treatment of cystic hygroma is exclusively a problem of surgery, it is a fact that many if not most of these tumors are radiosensitive to a remarkable degree. A small series of cases treated primarily with irradiation and followed for adequate periods of time has shown a most satisfactory response in the majority of instances with no mortality. Infection was no problem in any case, and there were no recurrences in those lesions successfully treated. Careful planning in treatment technique can be done in such a way as to obviate possible damage to growth centers. This approach to treatment is of definite value and should be considered carefully along with surgery weighing the advantages and drawbacks of each method when selecting the wisest plan of attack in any individual situation.

ABSTRACT OF DISCUSSION

DR. DEAN JONES, San Antonio: Dr. Martin has dealt with this subject fully and adequately and obviously has perused the literature on the subject rather extensively. I believe he has considered all of the possible disadvantages of radiation therapy of these lymphangiomas, but some of these will stand further emphasis.

Practically all of these cases are treated in infancy so that the whole lifetime is ahead of the patient. This allows ample time for all the possible late sequelae of irradiation to develop. In view of the rather high dosages used I would expect some of these people to develop atrophic skin changes in later life and occasionally skin malignancy to ensue. Dr. Martin has encountered little developmental disturbance but one case did have underdevelopment of the breast on the side of the treated lesion.

It seems evident from the case studies that the roentgen beam has been a worse offender in producing undesirable sequelae than has the use of radium. This is to be expected in view of the physical characteristics of the two modes of irradiation. The inverse square law is a potent protective factor in the use of radium applicators at a distance of 2 cm. from the skin surface. Relatively little radiation reaches the deeper structures and even the skin effects are likely to be of lesser import.

Worthy of note is the fact that lesions of this group are rarely seen in adults, and this suggests that there must be a natural tendency for such lesions to regress. Indeed some authors have stated that such spontaneous regression does ofttimes occur. Such a statement may be found in Boyd's textbook of pathology.*

These considerations are called to your attention merely as a note of caution. It is well to keep in mind that this is a benign lesion, subject to spontaneous regression, and that radiation in early life may and does lead to undesirable late changes which can exceed in seriousness the original disease.

Now allow me to get back into the good graces of my colleagues by saying that Dr. Martin has shown, and I agree, that there is a place for radiotherapy in the treatment of lymphangiomas and that we need not yield the treatment of cystic hygroma entirely to the surgeon.

SELF EXAMINATION OF THE BREASTS
A Suggestion in Technique

ROBERT S. SPARKMAN, M.D., Dallas, Texas

THE importance of self examination of the female breast cannot be overemphasized. It is estimated that 18,000 women die annually in the United States as a result of breast cancer. One of every 25 adult women can be expected to develop this disease.

It is agreed that the best prospect for further improvement in therapy of breast cancer lies in earlier recognition. Shimkin and associates[6] expressed the belief that if all patients experienced delay of less than one month from apparent onset of breast cancer to definitive treatment, a five year survival of 60 per cent could be achieved. Haagensen[3] estimated that more than 90 per cent of women who develop breast cancer discover their tumors themselves and expressed his conviction that instruction of women in self examination of the breasts offers the best hope of improvement in control of breast cancer. Education of the public by means of motion pictures and articles in the lay press is directed toward this objective and is obtaining results. It is becoming commonplace for a patient to report the discovery of a mass in her breast directly after seeing an article or film dealing with this subject.

The American Cancer Society has emphasized the importance of early diagnosis and has issued films and monographs for the instruction of the profession as well as the lay public. It is insufficient for the physician merely to advise his female patients to conduct periodic self examination of the breasts; he is obligated to give careful and detailed instruction in the steps to be carried out in order that this self examination may be performed effectively. These steps are outlined and illustrated in the monograph written by Haagensen[2] for distribution to physicians by the American Cancer Society and also are demonstrated in motion picture films issued by this society for both lay and professional instruction.

An indication of the effectiveness of the film for lay instruction may be gained from the report of one Iowa county[1] where it was shown to 1,280 women more than 35 years of age. Of this group, 120 subsequently underwent complete physical examination; 32 of the group were found to have breast lesions necessitating biopsy, of which 6 were malignant. In Texas, the M. D. Anderson Hospital for Cancer Research has prepared a pamphlet[5] illustrating the methods of self examination of the breast; this is available to physicians for distribution to patients.

From the Department of Surgery, Southwestern Medical School of the University of Texas.

HELPFUL MANEUVER

My attention was directed recently by chance to a maneuver which subsequently has proved to be of material aid in the detection of masses in the breast. A patient was seen because of a firm axillary mass which was suspected to arise from breast carcinoma, but the primary tumor eluded detection on each of several examinations. Immediately prior to operation, while the breast was being washed with soap, it was noted that the primary tumor, which had theretofore escaped detection, could be felt as the soapy hand glided without friction across the surface of the breast.

This idea is by no means new in principle. Haagensen, in his monograph, advised that "when palpation of the breast is carried out in warm weather and the skin is moist, a little talcum powder on it diminishes friction and may add to the accuracy of tactile perception." The origin of this technique, which often has been employed by me to advantage, is ascribed by Haagensen[4] to Dr. George Semken of New York.

Although this maneuver may be of occasional help to the physician, its chief importance lies in its adaptation to self examination by the patient herself. Careful questioning frequently will disclose that a tumor was first detected by the patient during the course of her bath. This is probably due not so much to any unusual thoroughness in palpation at this time as to the frictionless gliding of the hand over the soapy surface. Since the erect or sitting posture of the patient in the shower or bath is not the optimum one for the detection of lumps in the breast, examination while bathing should not supplant the periodic examination in the recumbent position carried out according to prescribed techniques. It is a worth-while supplement to the usual methods, however, and one which the patient should be encouraged to carry out at frequent intervals.

NOTES ON THE SURGERY OF BREAST TUMORS

T. H. THOMASON, M. D., F.A.C.S., Fort Worth, Texas

IT IS the purpose of this paper to call attention to the importance of the breast in the feminine economy, to stress the virtues of a thoughtfully planned surgical approach to lesions of that organ the exact character of which must be determined, and to review briefly the several steps of radical mastectomy. A consideration of plastic procedures, purported to elevate sagging structures or to trim them down to normal (or desirable) size is beyond the scope of this effort, which concerns itself essentially with the surgery of tumors.

The breasts are anatomic structures which in these latter days have assumed an importance far in excess of their original function of lactation. Poets, painters, and sculptors of all ages have paid homage to them. The breasts are woman's badge of womanhood, the external and visible evidence of her sex, often her most beauteous feature, sometimes her greatest asset in the game of life, and ironically enough, sometimes too her greatest liability. Budding in maidenhood; ripening gracefully in the teens and early twenties; magnified and glamorized by Hollywood, the sweater girls, and the resort advertisements; capitalized by dames of the Dagmar and Irma class; borne with pride and dignity by young matrons; propped, supported, and uplifted by women of middle years; and endured by elderly females as more trouble than they are worth, these structures seem designed by nature to command attention and therefore must be of paramount concern in the calculations of most women.

Constantly changing as the fires of ovarian activity wax and wane, the breast is often the site of tumors, benign or malignant, the treatment of which is surgical removal. And because the breast is such an essential part of feminine charm, cosmetic considerations are of prime importance and deserve the studious attention of all who would aspire to perform such surgery.

For the time being, then, we are specialists in breast surgery. The indications for operation are clear. The patient is on the operating table. She has a tumor of the breast. It is time for the incision. Where and how shall we make it?

INCISIONS

Let us assume that the lesion to be removed is in all probability benign and that our objective is local excision of the tumor with minimal disturbance of the contour of the breast. The site of the growth determines the site of the incision, and a consideration of the normal tension lines of the skin (Langer's lines) should determine the direction of the incision. When possible, incisions should run parallel to Langer's lines if the least noticeable scar is to be obtained. A radial incision may be used medial to the nipple but is seldom indicated elsewhere. Tumors in the upper, outer, and lower quadrants rate a marginal incision. Lesions near the nipple and not too deep or too large can be attacked through an incision in the areolar margin with almost invisible scars. If the existence of a lesion is in doubt, exploration can be carried out through a marginal incision with the exploring finger in the loose tissue underneath the breast. When simple mastectomy is indicated, a transverse elliptic approach is the operation of choice.

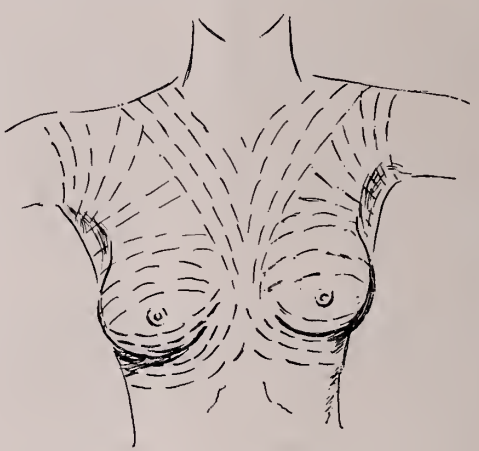

FIG. 1. Drawing of female chest showing Langer's lines.

With careful and considerate technique, pain is negligible and serum formation need not occur. There is little disability, and the patient is restored to her pristine charm with no deformity or distortion of outline.

In recent years, thanks largely to the educational effort of the American Cancer Society, patients are increasingly alert to the menace of cancer and present themselves with smaller tumors, the true nature of which can be revealed only by the finality of the microscope. The apparently benign lump we have taken out on frozen section may prove malignant. If we are wise, the patient has been prepared for this eventuality and has given the green light for the more extensive operation if that should be nec-

essary. Excision biopsy followed by surgery a few days later does not materially affect adversely the subsequent course or prognosis.

The idea of the futility of radical surgery is increasingly prevalent, but unless we accept it, the radical operation remains the most effective treatment for cancer of the breast. The several incisions for radical mastectomy include those described by Halsted, Willy Meyer, Kocher, Greenough, Warren, Stewart, and Rodman. At least twenty-eight different incisions have been described. Which one we should use may be governed in large part by the location of the growth and by the habit of the operator. It is unwise to try to make any one incision apply to all cases. Improvisation is one of the tricks of our trade. The man with the knife should use the incision which will best enable him to excise enough skin in the vicinity of the lesion, give him ready access to the peak of the axilla, and yet provide the most comfortable closure. Regardless of the incision chosen, primary closure may be impossible and resort to supplementary skin grafting may be necessary.

DISSECTION

Once the incision is made, the operation proceeds along fairly stereotyped lines, designed to remove thoroughly the breast and its environs. The surgeon may elect to detach the breast from the chest wall before he attacks the axilla. There is more logic and less bleeding in proceeding first with dissection of the axilla. The surgeon visualizes the pectoralis major muscle, the lower margin of which is his first landmark after he gets through the skin of the axilla. It is well to carry the dissection posteriorly and laterally until the anterior margin of the latissimus

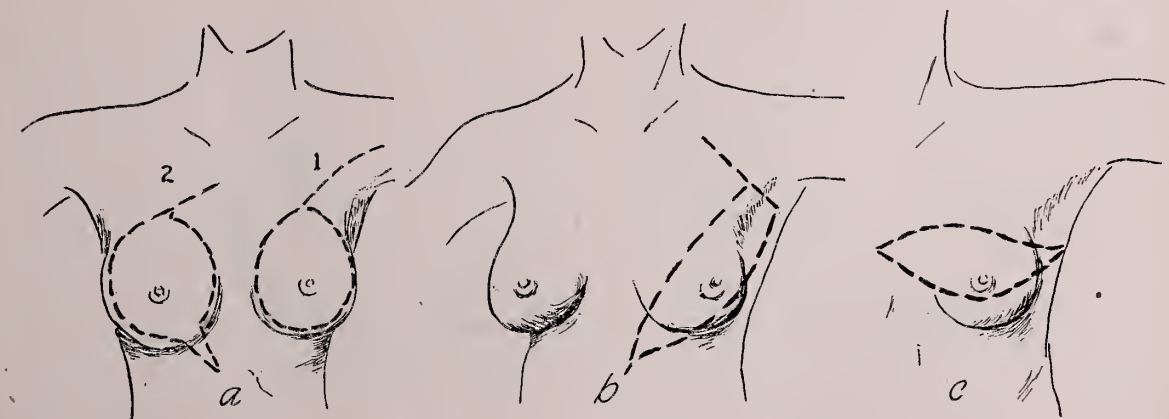

FIG. 3. Incisions for radical mastectomy.
a. *1:* Halsted incision; *2:* incision of Kocher.
b. Incision of Rodman.
c. Transverse incision of Stewart.

dorsi muscle is encountered, marking as it does the lateral limit of the axillary dissection. The lower two-thirds of the pectoralis major is isolated and divided near its tendinous insertion into the humerus and reflected medially and downward. This exposes the pectoralis minor muscle and beneath it the costocoracoid membrane, which the operator already has visualized in his mind's eye. The pectoralis minor is divided near its insertion into the coracoid process and reflected downward, and the costocoracoid membrane is incised thus exposing the contents of the axilla.

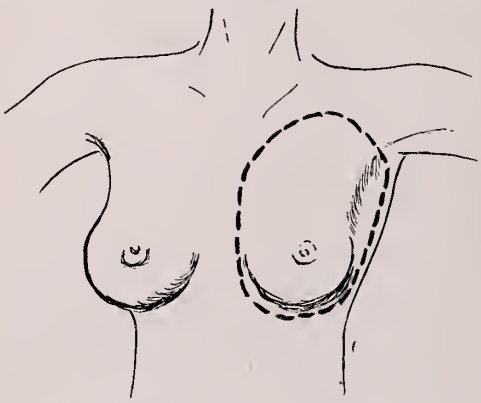

FIG. 4. Area of dissection in a radical mastectomy with any type of incision.

Dissection of the axilla then is carried out, beginning at its peak where the axillary vein emerges from the chest, and clearing that vessel of tributary veins and gland-bearing tissue from above downward and from within outward. At the outer extent of this dissection are encountered the subscapular vessels and thoracodorsal nerve and just beyond them the margin of the latissimus dorsi. The mass of gland-bearing axillary tissue with the pectoral muscles is reflected downward, leaving the axillary vein and subscapular artery, vein, and nerves, and exposing the muscular walls of the axilla, including the long thoracic nerve of Bell.

Removal of the breast is the next step, and this is done with more rapidity and ease from the margin of the latissimus dorsi muscle medially to the sternum, leaving the reflection of the sternal part of the incision to the last. This completes the dissection, and left exposed are the chest wall with the long thoracic nerve, the denuded axillary vein, the subscapular nerves and vessels, the latissimus dorsi and subscapular muscles, and perhaps the upper origins of the rectus abdominis muscle.

Closure of the skin completes the operation, usually with a drain to the axilla and a pressure dressing. Closed drainage with a catheter, recently suggested, may offer a better solution for an annoying problem. Free use of the arm is encouraged. Serum formation is the rule rather than the exception but usually ceases in one to three weeks. Swelling of the arm is a common sequela but need not be disabling. Excellent prostheses minimize the deformity and salve to some extent the psychic insult of losing the breast. Disability is of relatively short duration considering the enormity of the operation.

SUMMARY

A thoughtful and considerate approach is recommended in breast surgery with emphasis on the cosmetic result. Common incisions are reviewed with special reference to the several steps involved in radical amputation of the breast.

1226 Pennsylvania Ave.

ABSTRACT OF DISCUSSION

DR. ROBERT F. SHORT, Dallas: Dr. Thomason's paper contains a great deal of information, all of which I adhere to closely. I do wish to state that any tumor of the breast

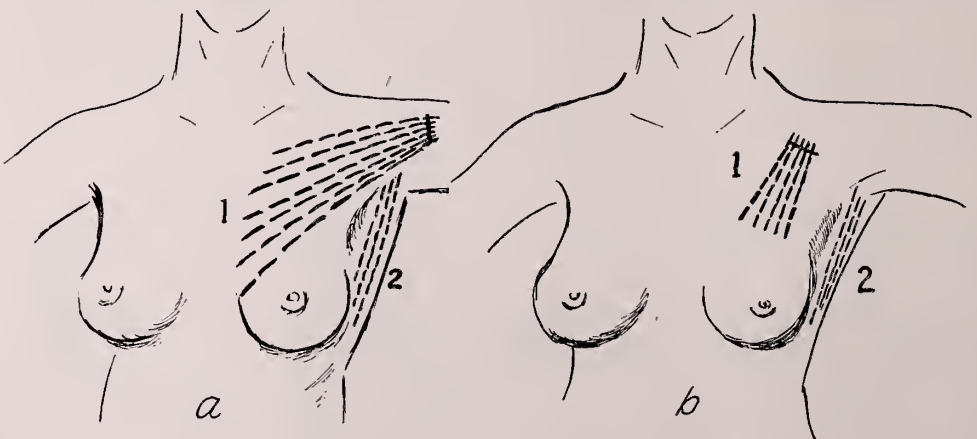

FIG. 5. Landmarks in dissection. *a—1:* pectoralis major muscle; *2:* latissimus dorsi muscle. *b—1:* pectoralis minor muscle; *2:* latissimus dorsi muscle.

that is painful is practically never malignant. A malignant breast almost always is found accidentally, with no pain attributable to it.

Dr. Thomason has described closely the technique in a radical resection of the breast. I have found that if there is present in the apex of the axilla one node, called Halsted's node, the outcome usually is fatal. If glands are in the axilla, I frequently resort to radiation therapy, although I am still at loss to say whether this is of value.

For pressure dressings I use flat rubber sponges employing at time an Ace bandage, which will give total pressure and eliminate a great deal of the serum exudate.

Treatment of Malignant Bladder Tumors

GRAYSON CARROLL,* M. D., F.A.C.S., St. Louis, Missouri

THE treatment of malignant bladder tumors depends on the location of the lesion and the depth of the infiltration into the wall of the bladder.

All tumors of the vault of the bladder may be segmentally resected. Tumors overlying or involving one ureter may be segmentally resected, transplanting the ureter into another portion of the bladder. Lesions found on the floor of the bladder about the trigone or bladder neck are the most serious and pose the greatest problem.

The papillary tumors invading only the most superficial layer, usually having a small base, are easily diagnosed and treated by cystoscope; although they have a tendency to recur or reimplant, the prognosis in this type is favorable. Those showing infiltration into or beyond the muscle layers have a much poorer prognosis and require a carefully planned type of therapy, usually radical. All types of tumors may infiltrate deeply, but the pedunculated sessile types usually infiltrate the deepest. They may be of transitional or epidermoid type.

The diagnosis as to the depth of the infiltration is the real problem. Broders' classification, grading malignancy group 1, 2, 3, and 4 by the microscopic appearance of the cells and their arrangement, is helpful but not determinate. The cystoscopic appearance is extremely helpful, since the large sessile or pedunculated bases with ulcerated and necrotic surfaces are usually deeply infiltrating.

The greatest diagnostic aid is the biopsy specimen which is removed transurethrally either with the electrical cutting loop or the Lowsley rongeur. This tissue should include practically all the layers of the bladder even at the risk of penetration, and the pathologist should be advised to report the depth of penetration in relation to the muscular layers.

The third valuable aid is the bimanual palpation of the tumor under deep anesthesia, preferably spinal anesthesia, with the hand pressing down forcibly over the lower part of the abdomen against the finger in the rectum in the male and in the vagina in the female. It is remarkable how distinctly some of these tumors can be palpated in this way. Immobility of the bladder or thickening laterally suggests deep infiltration.

PROGNOSIS

Jewett's work is accepted as a criterion for prognosis. He studied 80 cases to determine the effect of depth of mural infiltration on five-year results after complete extirpation of the primary growth. Thirty-nine patients had simple cystectomy and 41 segmental resection. Of 19 patients with tumors which infiltrated less than halfway through the muscularis, 14 lived from five to fourteen years without recurrence or metastasis, whereas only 2 of 61 with deeply invading tumors survived five years. Only 10 per cent of patients with superficially infiltrating tumors died with evidence of extension, as compared with 85 per cent of those with deep tumors.[4]

Another interesting observation which affects prognosis and treatment was the finding of Fletcher Colby, who stated:

> Radical lymph node dissections were performed recently on 39 patients. In none of seven patients without invasion of the bladder muscle were the pelvic lymph nodes positive for cancer. Of 32 patients with tumors which invaded the muscle, 47% had positive pelvic lymph nodes.[2]

TREATMENT OF INFILTRATING TUMORS

The early enthusiasm experienced with cystectomy and the diversion of urine by implantation of the ureters in the rectosigmoid has waned somewhat. The operative mortality has been greatly reduced and the immediate unsatisfactory features have been overcome, but the late results in many cases have not been favorable. Complications of transplanting the ureters into the rectosigmoid may be classified as (1) leakage of urine at the operative site, provoking peritonitis or abscess formation; (2) constriction of

This study made possible at St. John's Hospital by a grant from the Olin Foundation.

**Associate Clinical Professor, Department of Urology, St. Louis University.*

the ureter at the site of the anastomosis, resulting in hydroureter and hydronephrosis; (3) recurrent pyelonephritis caused by regurgitation of infection from the rectosigmoid; and (4) positive ascending pressure from the intestine.

The late results from this procedure include hyperchloremic acidosis in which the blood chlorides are persistently elevated and the carbon dioxide combining power is low. There is often a high nonprotein nitrogen level and high urea nitrogen. The patient has nausea, weakness, loss of appetite, loss of weight, and a general feeling of malaise. This is the result of reabsorption of the sodium chloride and the ammonium chloride from the urine in the intestine, and the renal failure which disturbs the tubular function. A low salt diet with administration of an alkali and frequent evacuation of the urine in the rectosigmoid will tend to correct this imbalance. However, this corrective procedure becomes less effective as renal failure proceeds.

Various procedures have been devised to overcome these objections. Elmer Hess, of Erie, Pa., recently has carried out on several patients with a tumor occupying one side of the bladder the procedure he describes as follows:

In the male, if the tumor is in one-half of the base of the bladder we take out the prostate and a large cuff of the bladder holding the tumor, ligating the ureter on that side, and then reimplanting the ureter into the small segment of bladder which we leave behind which, as a rule, carries the other ureter with it, and we sew this around a suprapubic tube. We then take a cone of bladder and sew it down to the posterior urethra, with a retention catheter in it, the same as we do when we do a total prostatectomy. We have on one occasion removed the entire base of the bladder, ligated both ureters, and reimplanted both ureters into the fundus of the bladder and resewn the fundus of the bladder down to the urethra where it has been severed. We have had good results with that.

In women, we do exactly the same thing, except that we take out the third of the urethra, bladderwise, instead of removing the whole urethra.[3]

Retaining the bladder and at least one of the ureteral orifices in most instances preserves the normal function. Dr Hess has stated that the patients are comfortable and continent, but the long-term results are not yet available. He has utilized the frequently observed fact that only a small amount of bladder tissue is needed to restore normal capacity and function.

Dean Sauer of St. Louis University, in an effort to avoid the infection caused by the reflux of fecal material and the reabsorption of urinary electrolytes by the colon, establishes a permanent midsigmoidal colostomy for complete diversion of the fecal stream and implants the ureters into the distal sigmoid colon after closure of its proximal end, thus using the rectum as a substitute for the urinary bladder. Seven cases have been treated in this manner with no evidence of electrolytic imbalance or pyelonephritis.[5] This procedure may prove of considerable value in avoiding the late sequelae of cystectomy but does resign the patient to a permanent colostomy.

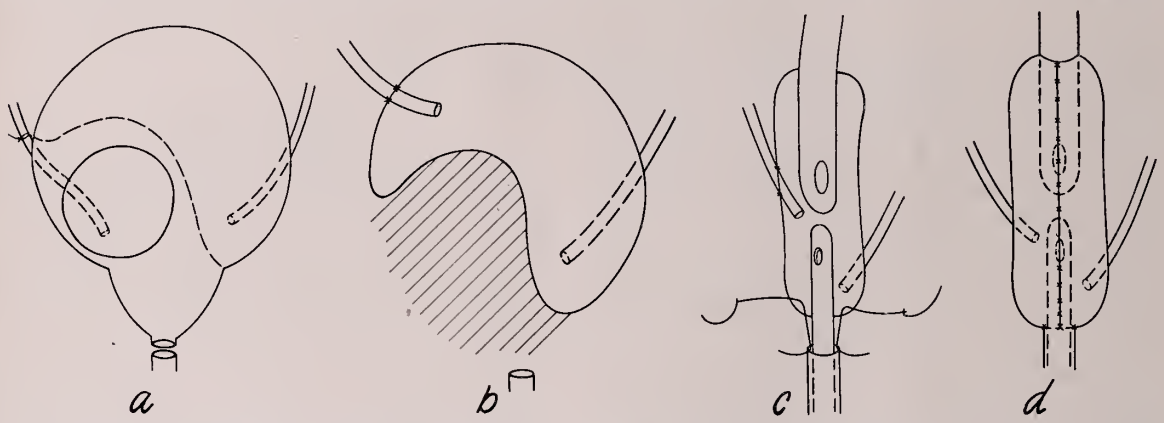

FIG. 1. The Hess procedure for treatment of infiltrating tumor of the bladder retains a small amount of bladder tissue, transplants ureters as indicated, and retains the external sphincter. It is a modified segmental resection.

Eugene M. Bricker utilizes an isolated segment of the terminal ileum with its mesentery intact as a urinary reservoir. This is accomplished by cutting a segment of the ileum, reestablishing the continuity of the gastrointestinal tract by end-to-end anastomosis and inserting the ureters into the segment of the ileum which is closed at one end and brought out as a colostomy on the lower right abdominal wall. A Rutzen bag is used as an external urinary reservoir.[1] Infection and back pressure are avoided by this method, but the patient has the inconvenience of the Rutzen bag, and electrolytic imbalance rarely occurs. This is demonstrated by a case so treated by Dr. Hollo, chief surgeon of Frisco Hospital, and me. Complete pelvic evisceration was performed for a rectal tumor which had invaded the prostate and

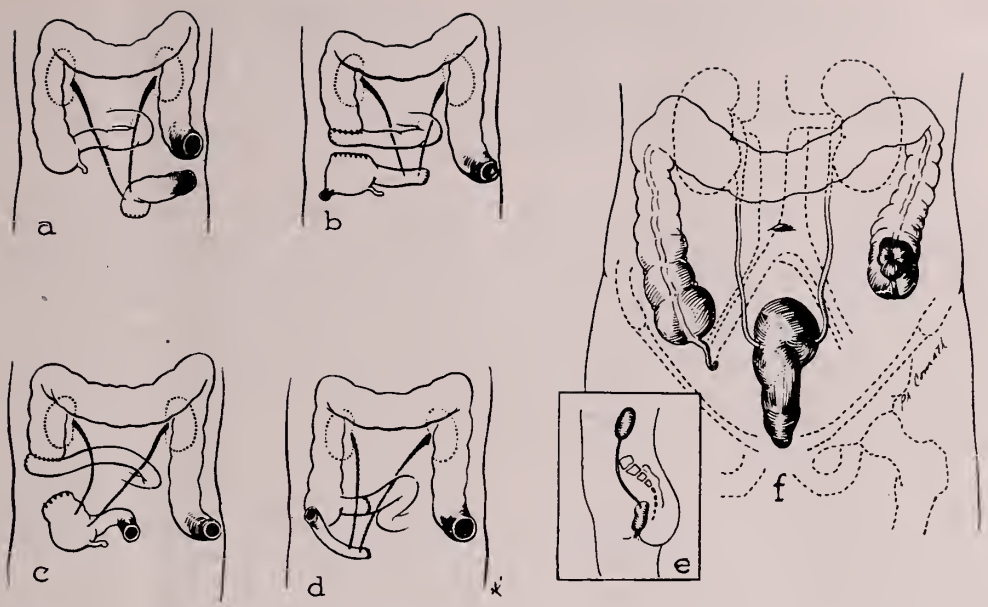

FIG. 2. The Sauer-Melick procedure for bladder tumor utilizes the excluded rectosigmoid colon for the bladder, transplanting ureters in it. A colostomy diverts the fecal stream. (After Sauer, D.: Paper read at the Interim Conference of International College of Surgeons, St. Louis, April 1, 1953. Illustrations *e* and *f* were published in Kinman, L. M.; Sauer, D.; Houston, V. T.; and Melick, W. F.: Substitution of Excluded Rectosigmoid Colon for Urinary Bladder, A.M.A. Arch. Surg. *66*:531-537 [April] 1953.)

bladder. A colostomy to divert the fecal stream was made on the lower left side of the abdomen and an isolated segment of the lower ileum was made for the diversion of the urine with an ostium on the left lower part of the abdomen. The chlorides gradually rose to as high as 750 mg. per 100 cc. of blood, and the carbon dioxide combining power dropped to 20 volumes.

From the findings of Fletcher Colby in which such a high percentage of the infiltrating tumors showed metastasis into the pelvic lymph nodes, it appears that a complete cystectomy is not sufficient, but evisceration of the pelvic fascia and lymph nodes is indicated. Even this is not curative in the deeply infiltrated group. This is borne out by a report of W. F. Whitmore and Victor Marshall of 53 pelvic exenterations performed at New York Hospital between June, 1948, and May, 1951. Lymph node metastases were found in one-third of the patients. Eight out of these patients showing metastasis were dead from return of the cancer, strongly suggesting that this may not be the solution to the problem in these markedly infiltrated cases. Seven out of 23 patients with infiltration beyond the muscle but no metastasis are well, and 9 out of 14 patients with infiltration into but not beyond the muscle are well. This may be the answer to the problem in this group.[6]

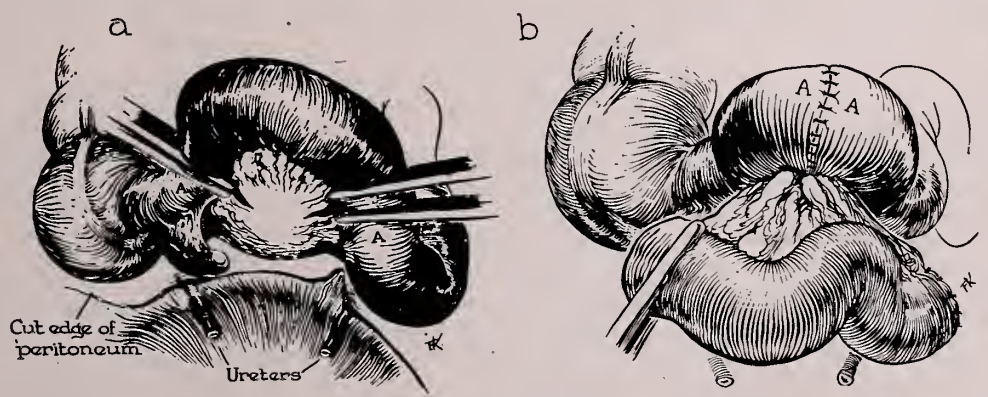

FIG. 3. The Bricker procedure for bladder tumor utilizes an isolated segment of ileum, transplanting ureters in it, and providing a urinary colostomy and end-to-end anastomosis of the gastrointestinal tract. A fecal colostomy is performed if rectum also is removed. (After Bricker, E. M.: Bladder Substitution After Pelvic Evisceration, S. Clin. North America *30*:1511-1521 [Oct.] 1950.)

The free use of blood transfusions, antibiotics, and improved operative skill have greatly reduced the operative mortality in these radical procedures.

SUMMARY

The proper method of diagnosis of bladder tumors in respect to prognosis and treatment has been discussed, emphasizing that the depth of infiltration of the tumor is the criterion which determines the prognosis and treatment. The biopsy specimen taken through all layers of the bladder and bimanual palpation under anesthesia afford the best methods.

The various surgical treatments are presented, with a critical analysis of the results.

ABSTRACT OF DISCUSSION

DR. B. W. TURNER, Houston: Today the concept of cancer of the bladder obviously is more advanced than it was twenty years ago. We who care for these patients know that we have yet to discover the cure that all are seeking. The past two decades have brought many new methods and ways of controlling this dreaded disease, mostly through radical measures that enable urologic surgeons to remove totally the lesion or lesions whereas in the past such was impossible.

Tumors of the bladder are to be graded by their cellular groupings and their depth or penetration into the bladder wall. This may be considered the number one factor in the handling of these cases. The location of tumors of the bladder is considered the number two factor. I have tried to simplify the classification of bladder tumors into as few groups as possible and have used the following classification: Papillary, squamous cell, adenocarcinoma, transitional cell, and undifferentiated type.

In the treatment of bladder tumors the small papillary group of the superficial type may be destroyed by simple fulguration. The type that has not penetrated to the serosa may be resected by the transurethral approach to the best advantage, unless it is located in the dome area where in most cases segmental resection is the choice procedure.

In the highly malignant types, deeply penetrating the walls of the bladder and invading or penetrating the serosa, radical cystectomy is indicated unless the process has extended to the retroperitoneal glands and gland dissection is not considered feasible. In cases in which cystectomy is indicated, with or without gland dissection, the procedure is preceded by ureterosigmoid anastomosis, and in my hands the Cordonnier technique, with or without modification, has been the choice procedure. Both operations are done at the same time unless the condition of the patient renders it unsafe.

Lesions of the dome or side walls of the bladder, unless they are superficial and small and papillary in type, are cared for by segmental resection. Lesions on the base of the bladder may be resected by the transurethral route unless they penetrate too deeply to be resected beyond the tumor extension; then cystectomy must be employed.

I care for about 75 per cent of tumors of the bladder by the transurethral route. I do not employ any type of radiation as I am of the opinion that it has not helped as I once thought it did and that time has proved almost all bladder tumors to be radioresistant.

I wish to emphasize a few points in the examination of patients:

1. A careful cystoscopic survey of the entire bladder wall should be made, using the observation lens with the bladder filled to near capacity. Then with the panendoscope the posterior and bulbous urethrae should be studied. The panendoscope is not a cystoscope, and the bladder mucosa cannot be properly visualized through it.

2. A specimen of tissue of all suspicious lesions should be removed for biopsy.

3. A bimanual examination should be made in an effort to detect superficial or deep glands, fixation, induration, thickening of the walls, and so forth.

4. It is necessary to employ routine follow-up examinations in all bladder tumor cases, including bone and chest roentgenograms as well as cystoscopic examination.

5. An unfortunate sequence of bladder tumor is that symptoms usually come late; if we urologists are to find more bladder lesions, we must spend more time examining the bladders of patients subjected to routine cystoscopic study.

WHARTON NURSES' HOME RECEIVES AWARD

The Josephine Traylor Brooking Memorial Nurses' Home, for which ground was broken in Wharton early in February, won an award in an architectural design competition conducted by *Progressive Architecture.* Architectural firm planning the building, the first to be erected for the Gulf Coast Medical Foundation in a proposed medical center adjacent to Wharton County Junior College, is Fehr and Granger of Austin.

The nonprofit medical foundation contemplates erection of a 100 bed hospital and other buildings in the new center. Arrangements already have been made for training of vocational nurses at the junior college, and these students will stay in the new home now being constructed.

Physical Medicine Contest Scheduled

An essay in the field of physical medicine and rehabilitation by a medical student, intern, resident, graduate student in preclinical science, or graduate student in physical medicine and rehabilitation will be eligible for a cash award of $200, a gold medal, and a certificate. The contest, sponsored by the American Congress of Physical Medicine and Rehabilitation, closes June 1. Inquiries may be addressed to the congress, 30 N. Michigan Avenue, Chicago 2.

Doctors in Alcoholics Anonymous

The fifth annual International Group of Doctors in Alcoholics Anonymous will meet in Akron May 14-16. Doctors, Mayflower Hotel, Akron, Ohio, may be written for information and reservations.

TUMOR SEMINAR

Conducted by

Lauren V. Ackerman, M. D., St. Louis, Missouri

THE Ninth Annual Tumor Seminar of the San Antonio Society of Pathologists was held at Brooke Army Hospital, Brooke Army Medical Center, Fort Sam Houston, Texas, November 1, 1952.

The meeting was opened by Col. Carl J. Lind, Jr., MC, chief of Laboratory Service, Brooke Army Hospital, who introduced Major Gen. E. A. Noyes, MC, commanding general of Brooke Army Medical Center; Major Gen. Martin E. Griffin, MC, commanding general of Brooke Army Hospital; and Dr. A. O. Severance, secretary-treasurer of the San Antonio Society of Pathologists. Colonel Lind honored Dr. B. F. Stout as the originator of this society, its president for many years, and the backbone of the society. Credit for work on the seminar was given to Capt. Francis J. Sullivan, administrative officer who organized the mechanics of the assembly, and to Mrs. H. A. Watson and Mrs. A. C. Krukowski, who type and edit the proceedings of the seminar for publication. The photographs were prepared in part by Mr. Henry Marasco of the photography section. Capt. Robert E. Kellenberger was the pathologist responsible for organizing, preparing, and coordinating all details between contributors, Dr. Ackerman, and many others. Monetary support was given by the American Cancer Society and the South Central Region of the College of American Pathologists. The slides were prepared by the M. D. Anderson Hospital for Cancer Research in Houston under the direction of Dr. William O. Russell.

Dr. Severance introduced Dr. Lauren V. Ackerman of St. Louis, who is professor of surgical pathology and pathology at Washington University. The first case then was presented.

CASE 1

Diagnosis.—Carcinoma with excessive mucin production.

Contributor.—Dr. Lauren V. Ackerman, Washington University School of Medicine, St. Louis.

History.—A soft, reddish, gelatinous lump measuring 2.5 cm. in diameter was excised from the breast in a 57 year old woman. There were no palpable regional lymph nodes and no history of discharge from the nipple.

Submitted diagnoses.—Adenocarcinoma (mucinous, colloid, and so forth), 31; intraductal papilloma, 6; intraductal carcinoma, 2; intraductal adenoma, 1; fibroadenoma, 1; tumor of skin appendage origin with sebaceous elements, 1.

Dr. Ackerman: In this case almost everybody believes that this was a mucinous or colloid type of carcinoma. There were 2 diagnoses of intraductal carcinoma. I think the carcinoma was far beyond the ducts so that this designation could not be used.

This tumor is composed of small nests of well differentiated tumor cells separated by lakes of mucin. This is a carcinoma of the breast which has a characteristic gross appearance. Grossly the tumor is soft, often rather demarcated, and frequently gelatinous and somewhat currant jelly–like in appearance. This gross appearance with apparent encapsulation is often misleading to the surgeon. However, these tumors are true carcinomas and must be treated by radical mastectomy. They have a somewhat better prognosis as a group than the usual carcinomas of the breast, for they appear to grow more slowly and metastasize in a lower percentage. The mucin arises from the epithelial cells of the tumor rather than from a degeneration of the stroma (fig. 1). If the tumor metastasizes to a lymph node, the mucin is also present, which is further evidence of origin from the tumor cells. This type of carcinoma with excessive mucin production is in contrast to the rare carcinoma of the breast in which the mucin is confined to the cytoplasm (so-called signet ring type). This type of carcinoma of the breast has an extremely poor, if not hopeless, prognosis in all cases.[1]

Radical mastectomy was done on this case on September 26, 1951, and the regional axillary lymph nodes, 17 in number, showed no evidence of tumor. The patient was last seen on March 10, 1952, and showed no evidence of recurrence.

Dr. A. O. Severance, San Antonio: I have heard it said by some that colloid or mucoid carcinoma of breast does not metastasize to axillary nodes. I have thought they can metastasize occasionally.

Dr. Ackerman: I feel that the type of tumor demonstrated has a tendency to grow slowly and will have metastasized at the time of operation in a low percentage of instances. I had a patient who had a carcinoma of this type with only one lymph node involved; lesions in the lung and bone developed but grew very slowly. The patient died about four years after the tumor metastases were recognized.

CASE 2

Diagnosis.—Breast, intracystic papilloma.

Contributor.—Col. A. M. Richmond, MC, Fourth Army Area Medical Laboratory, Fort Sam Houston.

History.—The patient noted a lump a few days prior to admission. There were no clinical signs of infiltrating tumor. A mass of solid tumor inside a thick-walled cyst was found at surgery. The wall of the cyst was not perforated at the operative procedure.

Submitted diagnoses.—Intraductal papilloma, 23; carci-

noma, 8; cystadenoma, fetal adenoma, and so forth, 7; sclerosing adenosis, 2; cystosarcoma phylloides, 1.

Dr. Ackerman: I think most of you have believed this was benign. Only 8 believed it was carcinoma, so the majority are with me.

Dr. Hugh Grady of the Armed Forces Institute of Pathology made the following comment: "The critical questions in this case are (a) is the primary tumor malignant and (b) do the two isolated nests of tumor cells in lymph nodes constitute metastasis, or do they represent tumor emboli which have been extruded from the main tumor mass by mechanical manipulation incidental to examination and operation, but which are not destined to implant in the substance of the node, survive, and grow autonomously? Neither question can be answered unequivocally. Most observers are reluctant to consider the primary tumor malignant on purely histologic criteria. The findings in the lymph nodes are not conclusive evidence of metastasis in the stage at which they are observed; speculation as to their probable fate is beyond the realm of empirical science."

Sections show a mass of tumor within a fairly thick-walled cyst. The individual cells are forming acini, and many of these acini are lined by apocrine cells with prominent pink cytoplasm. In other zones there are papillary projections supported by connective tissue vascularized cores. These lesions vary in cellularity. In some areas there are rather prominent aggregates of cells. In such cellular, apparently growing areas, mitotic figures are not uncommon, but they are normal mitotic figures. In the breast parenchyma surrounding this lesion there are a few nests of cells within apparent lymphatics. These cells do not appear abnormal. The tumor within the thick-walled cyst is well supported by connective tissue stroma, and there are no areas of necrosis (fig. 2).

The tumor was well differentiated and well supported by connective tissue stroma, and there is no necrosis (fig. 4). These findings are all against the diagnosis of a malignant tumor. The fact that there are few nests of tumor cells in the surrounding lymphatics does not necessarily indicate that this is a malignant neoplasm. I suspect that it could occur because of trauma to the tumor, perhaps from examination or at the time of operation. Apparently this patient had a radical mastectomy. An axillary lymph node shows a nest of tumor cells within a peripheral sinus (fig. 3). These tumor cells are uniform in appearance and look like the cells seen within the lymphatics of the breast. Their presence within this peripheral lymphatic is not evidence to me of malignant change but merely suggests that tumor reached the lymphatics and was carried to the regional lymph node. I do not believe that it would have the capacity to continue to proliferate, grow in the node, or distantly metastasize. This, naturally, is a personal opinion and cannot be proved. If you say that it is malignant tumor within the peripheral sinus with capacity to grow replacing the lymph node and metastasize, I cannot disprove this statement either. However, tissue such as endometrium also can break into lymphatics and be transposed to distant areas. This does not make the endometrium malignant. I feel that all that was indicated in this patient was local excision of the lesion. This lesion is certainly not a cystosarcoma phylloides because that lesion shows malignant changes in the stroma and there are no changes in the stroma of this tumor.

Dr. A. O. Severance, San Antonio: What percentage of intraductal papillomas do become malignant?

Dr. Ackerman: I have never seen a single one with this pattern become malignant.

Dr. Severance: Given this same case once more in your laboratory, you're looking into the microscope, you're seeing those patterns in the lymphatics, would you say leave the patient alone or do a radical?

Dr. Ackerman: I would just leave it as is. I would say no further treatment is indicated.

The follow-up report said that the patient had had roentgen-ray therapy which was completed on July 22, 1952. I think all of us would be in agreement that roentgen therapy given to a patient with these equivocal findings would be contraindicated, because roentgen therapy, if it were given to cure cancer, has considerable morbidity. I have seen 2 patients during the past two years with extreme irradiation effect in the lungs sufficient to cause symptoms necessitating pneumonectomy.

Dr. W. R. Mathews, Shreveport: When do you recommend irradiation in mammary cancer?

Dr. Ackerman: Let us say that you select for surgery the patients who are truly operable. Then, if you have a surgeon who knows how to do a radical mastectomy, the percentage of local recurrences on the chest wall and axilla is around 10 per cent. If you irradiate the chest and axillary areas, you are irradiating a wide area in which there is only a 10 per cent chance of local recurrence. If the tumor recurs in the immediate area of the breast, it will appear in the anterior mediastinum or within the supraclavicular area. How can we predict which cases are going to have tumor in those areas? Dahl-Iverson did supraclavicular biopsies on an appreciable number of cases, and in the patients who had axillary lymph node metastases one-third had supraclavicular lymph node metastases. In another group of patients who had tumor arising in the central quadrant or the inner quadrant of the breast, Hanley was one of the first routinely to do a biopsy on the anterior

mediastinum, and in those patients with tumors in the central or inner quadrants the percentage of those with mediastinal lymph node involvement was up as high as 40 or 50 per cent. Finally, if a patient has a tumor in the outer quadrant of the breast and the axillary lymph nodes are negative, in practically no instance will the supraclavicular or the anterior mediastinal lymph node areas be involved.

So, let us take that information and try to decide about roentgen-ray therapy. In the first place it would not be rational to give roentgen therapy to the patients who had a tumor in the outer quadrant and had no evidence of lymph node metastasis. I think it would be rational to give roentgen-ray therapy to those patients who had axillary lymph node involvement or who had tumors arising in the central or inner quadrant. And I would say that the therapy should be directed not to where the tumor is not, but to an area where the tumor is, which would be in an area extending up along the anterior mediastinum in an arch involving the supraclavicular area. That is the procedure which we are now following at Washington University except that we have set it up as a problem which statistically will take us perhaps ten years to find the answer. In other words, we have thrown out our cases that arise in the outer quadrant and have negative axillary lymph nodes (average number found 27). Then we have taken two groups, those that arise in the central or inner quadrant and those that arise in the outer quadrant and have lymph nodes involved. Then we have taken those two series and alternated the cases in those two groups so that in each of those two groups half of them receive irradiation and half of them do not. We are routinely doing biopsies of the second and third interspaces on those cases merely for the record. The lymph nodes found often measure no more than 5 mm. or the surgeon tells us, "I am sorry, but I was unable to get any lymph nodes for you." Yet, we block that material and lymph nodes are not only there but they are involved. We take the material which we receive from those spaces and subserial section it, and that often gives us increased information. Another way of handling that problem is Dr. Cushman Haagensen's method.[13] McDonald[22] biopsies the breast, anterior mediastinum, and supraclavicular area first. If the anterior mediastinum and/or supraclavicular area show cancer, then that patient is no longer operable and is placed in the group for irradiation therapy.

Dr. William W. Tribby, Memphis, Tenn.: How would you treat a carcinoma of the breast which, when first seen, is inoperable but responds so well to irradiation that it becomes operable? I have seen radical mastectomy done under these circumstances.

Dr. Ackerman: I have also seen patients with advanced inoperable cancer, with extensive skin edema, fixed axillary lymph nodes, and satellite skin nodules. I have seen irradiation given under these circumstances and have seen the whole area become very soft. I have seen the satellite skin nodule disappear, and then I have seen a surgeon examine the patient and say, "Well, this patient who was inoperable before is now operable." Those circumstances, in the cases with which I am familiar, resulted in stirring up of the fire; those patients developed metastases and died in a relatively short period of time after the operation was done. Perhaps there might be cases which did not follow that course, but I just happened not to have seen any.

I think the reasoning for that is in what happens to the patient with cancer of the breast that responds to roentgen-ray therapy. If the patient has skin edema, satellite skin nodules, that means the lymphatics are blocked by tumor. The reason why surgery is contraindicated is that no matter how wide the surgeon makes his skin incision, he will always be cutting through involved lymphatics. So, when he finishes he will have removed most of the tumor, he will have stirred up the fire, he perhaps will have increased the volume of tumor in distant areas, which on a theoretical basis may speed up the growth of the lesion so that the patient will die in a shorter time. In no instance in my experience have I ever found a case subjected to thorough irradiation that did not have evidence of viable, healthy looking cancer in the primary tumor and/or the regional axillary lymph nodes. I think that what irradiation does to a breast cancer is to kill some of the cells, but there are always some of the cells that are very hardy; they are not affected by the irradiation, fibrosis occurs, and the tumor is locked up for variable periods of time. For that reason I feel that irradiation therapy as such is an excellent palliative method of treatment, but I have not seen any of the cases which Dr. Tribby talks about that have done well.

CASE 3

Diagnosis.—Breast, cystosarcoma phylloides.

Contributor.—Dr. A. O. Severance, Baptist Memorial Hospital, San Antonio.

History.—The patient, a 41 year old woman government employee, noticed a lump in the breast one week prior to operation. There was no history of trauma. A rounded, firm, irregular tumor 3 by 4 cm. was felt in the left breast 3.5 cm. above the nipple, not attached to skin or fascia. No axillary nodes were palpable. Clinical impression: fibroadenoma.

The tumor, measuring 3.5 by 3 by 2.8 cm., was embedded in a mass of adipose tissue measuring 8 by 5.5 by 3.5 cm. It had a somewhat nodular surface, was well demarcated, and bulged on cut section. This cut section was

slightly shiny and showed pink lobulated tissue. Between the lobules were irregular branching narrow clefts.

Submitted diagnoses.—Cystosarcoma phylloides, 18; fibroadenoma, 7; chronic cystic disease, 4; localized fibrosis, 3; sclerosing adenosis, 3; sarcoma, 3; intraductal carcinoma, 1.

Dr. Ackerman: I feel that a surgeon who palpates a breast lesion, even though he has great skill as a palpater, will be right in only about 80 per cent of the instances in appraising a single lump. So, I do not believe that any dominant lump ever should be left in a breast on the basis of a clinical impression. I think that a surgeon who has a background in surgical pathology (naturally I think all surgeons who are doing any major surgery should have a background in surgical pathology) should be able grossly to appraise correctly about 80 per cent or so of the breast lesions. I think that under certain circumstances, given a surgeon with an extensive background, he might proceed with a radical mastectomy on merely the gross impression. However, in any case in which there is any doubt as to the appraisal of the lesion, it would be imperative that frozen section be done. I think that the pathologist should be able to decide on frozen section in a high percentage of the lesions. I do not consent to do a frozen section on a papillary lesion because I am afraid I might call it cancer, for intraductal papillomas of the breast are often highly cellular. If the surgeon gives it to me I say, "Thank you. I will see you tomorrow." Usually he says, "Why is that?" and I say, "Well, I am afraid if I did this frozen section I might call it malignant and probably I would be wrong." Usually it turns out that the lesion is benign. I feel that it does no harm if the pathologist does wait for the permanent sections.

Microscopically there are well-defined acini in this case which are uniform in appearance, and there are some areas of intracanalicular growth. In such zones the epithelium is thinned. There are a few areas in which apparent squamous metaplasia has occurred. In still other areas the stroma has become hyalinized and relatively acellular. In some zones the stroma has become highly cellular, made up of large masses of cells with great variation of their nuclei, and showing many mitotic figures, some of them abnormal.

To me this is a classic example of a tumor which is known as cystosarcoma phylloides of the breast. These tumors have had innumerable names. They show all gradations from benign to highly malignant. In the benign form some pathologists feel that the correct designation is giant intracanalicular adenofibroma. The epithelial elements are the passive elements, and the stroma shows the malignant changes. The decision as to proper treatment is important. These tumors are often inadequately treated by local excision and often locally recur. However, metastases to regional lymph nodes is distinctly uncommon. We reported a case with metastases to the regional lymph nodes of the sarcomatous element.[7] In Treves' study[41] of 77 cases, he felt that 36 of the group were malignant. However, metastases were clinically demonstrated in only 9 cases and were microscopically proved in 6. In all instances the malignant element in the metastases was sarcomatous, and in only 1 case was there metastastic involvement of a lymph node. Distant metastases to the lung was the commonest site. In a given case simple mastectomy should be done including the underlying pectoral muscle. If the tumor is unequivocally malignant, I would be in favor of a radical mastectomy in spite of the low chance of involvement of the regional lymph nodes.

Dr. F. P. Bornstein, El Paso: Would you comment on occurrence of lymph node metastases in fibrosarcomas and leiomyosarcomas?

Dr. Ackerman: All I can say is that I have seen metastases to lymph nodes in both of these tumors. I have not seen lymph node metastases in leiomyosarcomas of the uterus, but I have seen lymph node metastases in leiomyosarcomas of the stomach, and I have seen lymph node metastases on several occasions of fibrosarcomas of the soft tissues. So, I know they do occur but in a relatively low percentage.

Dr. L. J. Manhoff, Jr., San Antonio: What are your criteria for the histologic differentiation of intraductal papilloma and papillary adenocarcinoma?

Dr. Ackerman: Papillary carcinoma per se to me is an extremely rare neoplasm, and intraductal papillomas are relatively common. An intraductal papilloma is usually a small lesion, but at times it can be of fair size and at times it can grow within a cyst. Usually there is no evidence of any necrosis within the epithelial cells. The individual cells are uniform and often there may be apocrine epithelium; usually the tumor is well supported by connective tissue stroma. At times these tumors are highly cellular and at times they appear to be within the surrounding connective tissue, but cells within the surrounding connective tissue may simply mean that the tumor has been so cut and blocked that this is a false impression. I am not frightened by the cellularity of the lesion or its apparent invasion in the surrounding tissue. The papillary carcinomas of the breast are rare.

Sometime ago an article appeared which emphasized the prominence of bleeding as a sign of cancer of the breast. The inference from reading this article was that if there was bleeding from the nipple, there was cancer in a high percentage. I am sure that if you read just the conclusions that would be the inference. However, if you broke this group

down you would discover that if you excluded palpable cancers of the breast that had invaded the nipple and Paget's disease involving the nipple, and you included only cases in which there was a nonpalpable mass or small mass, the incidence of bleeding would be, I think, only 2 per cent.

A pathologist sent me two slides, for I had told him that I thought intraductal papillomas practically never, if ever, became malignant. In this instance a tumor of the breast was first diagnosed as benign, and then it recurred and was diagnosed as malignant. Therefore, it was considered that an intraductal papilloma had become a cancer, a papillary carcinoma. The first sections to me were unequivocally malignant, and the lesion therefore was a papillary carcinoma from its inception.

In 2 cases that have occurred during the first part of my stay at Washington University one patient came back with a recurrent mass in the breast and the other came back with a recurrent mass and metastases. In both of those instances the tumor of the breast had first been reported as a benign papillary tumor. Both of those tumors were of fair size, both of them were papillary, but in contrast to intraductal papilloma, the cells lining these papillary projections were malignant cells. There was also layering and loss of polarity, atypical mitotic figures, and rare areas of necrosis.

We have just seen another remarkable incidence of papillary carcinoma in which a man for ten years had in the region of the breast a palpable mass which was becoming steadily larger. Removal of that lesion showed a papillary cancer with invasion of the surrounding tissue; the entire tumor was a papillary tumor with layering of the cells and atypical cells lining the papillary projections.

Dr. Fred Stewart at the Memorial Hospital sees only a rare example each year in a group of say 700 breast cancers. But to me they are distinct from intraductal papillomas and represent slowly growing cancers which are malignant from the beginning.

Dr. Wilson G. Brown, Houston: Have you ever seen an adenocarcinoma occur in a fibroadenoma?

Dr. Ackerman: I have seen a single example of adenocarcinoma occur in a fibroadenoma. I have reported the sections. The entire tumor was cut at various levels and the cancer was entirely within the neoplasm.[3]

Dr. M. L. Trumbull, Memphis, Tenn.: Would you comment on management of bleeding nipple cases with no palpable underlying mass?

Dr. Ackerman: It is my feeling, as I have indicated, that when you have that situation you usually have a benign intraductal papilloma. It is the opinion of the surgeons with whom I am associated that if you examine that patient frequently, you will always be able to find a palpable mass and that all that is necessary is quadrant removal of the mass. You will find in almost every instance a benign intraductal papilloma. If you did such an operation and had an unexpected finding of cancer, I believe that no harm has been done to the patient and that radical mastectomy can be done. I think that some of the confusion about intraductal papillomas has occurred in chronic cystic disease, for you often see microscopic evidence of a little papillary proliferation, and I think that that is what is meant by some people when they say there are multiple papillomas throughout the breast. I think that all this means is that chronic cystic disease, with all the variations in its pattern, may have microscopic papillary proliferation, which is common in contradistinction to gross single intraductal papillomas. I think also it is difficult to get away from the follow-up of Drs. Haagensen and Stout's group of patients with intraductal papillomas which have been treated conservatively. This group never developed cancer, and in only a small percentage did recurrence appear.

Dr. William W. Tribby, Memphis, Tenn.: What does the word *phylloides* mean?

Dr. Ackerman: This is a term applied to a tumor which on section shows a lobulated leaflike appearance.

Dr. P. A. B. Cunningham, Galveston: Would you please give us your definition of *malignancy?*

Dr. Ackerman: I have never known how to define malignancy.

Dr. Cunningham: Have you seen other such benign metastatic deposits in lymph nodes from either a breast tumor or any other tumor?

Dr. Ackerman: As I have indicated, I fortunately have never recommended radical mastectomy for what I would call a benign intercystic papilloma. Therefore, I have never had the opportunity of examining axillary lymph nodes. In a case of thyroid tumor with tumor cells floating in the lymphatics or of parathyroid adenoma with tumor cells floating in the lymphatics, nobody will do a neck dissection, so I have not seen that happen. My experience is zero from that standpoint. However, if you had a highly cellular benign tumor and handled it roughly during surgery, I would not be surprised if tumor cells were pushed into the lymphatics and the lymphatics would then carry them on to the lymph nodes, where they would die because they do not have the power of invasion.

CASE 4

Diagnosis.—Brenner tumor.
Contributor.—Dr. H. J. Schattenberg, San Antonio.

History.—The patient, aged 38, had had menorrhagia and metrorrhagia for the preceding four years. An ovarian tumor could be palpated. Hysterectomy was performed. The uterus, tubes, and cervix were normal. One ovary contained an ovoid tumor measuring 2.5 by 3 cm. which was solid and golden yellow. The other ovary was normal. The endometrium was thickened, with glands in the proliferative phase.

Submitted diagnoses.—Brenner tumor, 23; granulosa and theca-cell tumor, 5; arrhenoblastoma, 3; thecoma, 3; theca-cell tumor, 1; dysgerminoma, 1.

Dr. Ackerman: I am happy to see that the majority are with me because I suffered with this tumor. I certainly entertained the diagnosis of granulosa and theca-cell tumor seriously. I do not believe that I could put it into the group of masculinizing tumors. I see no evidence of, say, interstitial cells; I see no areas of tubular formation; and I do not see any of the patterns which we conventionally associate with the arrhenoblastomas. I do not feel there is any resemblance to dysgerminoma because a dysgerminoma is a tumor which on cut section looks like brain tissue but microscopically exactly resembles a seminoma with large nuclei and prominent nucleoli without any fibrous background. So, my diagnosis on this case is a Brenner tumor.

The tumor is apparently well encapsulated and made up of two types of tissue. There are nests of cells with uniform nuclei and pink cytoplasm separated by a rather cellular stroma. The stromal cells are uniform with somewhat spindle-shaped nuclei. The reticulin stain demonstrates abundant reticulin in the stroma but no reticulin in the epithelial-like cells.

The gross description of the endometrium suggests that the neoplasm of the ovary was an estrogen-secreting tumor. Usually with such a tumor there is also hypertrophy of the myometrium. The pattern of this tumor suggests that it could be a mixture of thecal and granulosa cells. Both of these elements have a similar origin from the ovarian mesenchyme. These cells do not have the pattern of the estrogen-secreting Sertoli cell tumors demonstrated by Teilum.[39] Sometime ago McKay[23] demonstrated histochemically that there were reactive materials present in the theca cells of the thecomas and in the theca-like cells of the granulosa-cell tumors. He wrote: "From these and other considerations it seems likely that the thecal component of granulosa-cell tumors, rather than the tumor cells themselves, is concerned in hormone production. One case of a nonestrogenic or 'pure' granulosa-cell tumor is reported." The fibrous elements do not have the hyaline plaques of the thecoma, and most important, there is no sudanophilic material present. The collections of epithelial-like cells do not have the pattern of granulosa cells and, most unusual, are grouped in small nests. These focal collections of cells fit best with the Brenner tumor. The Brenner tumor arises from Walthard cell rests. At times central change occurs in the middle of these cells with pseudomucinous change. On one occasion I have seen a pseudomucinous tumor associated with a Brenner tumor. It is of considerable practical importance to separate a Brenner tumor from a granulosa-cell tumor, for the Brenner tumor is invariably benign and the granulosa-cell tumor is often malignant.

Dr. Leo Weiss, Dallas: Have you ever stained Walthard cell rests for mucin? If so, was the reaction positive?

Dr. Ackerman: I have never done that; however, I think that is an excellent idea. I may say that in the Walthard cell rests that I have seen, I have never seen the pseudomucinous areas in them. Have you, Dr. Weiss?

Dr. Weiss: No, I have not.

Dr. J. A. Carroll, Galveston: How often do you see nonfunctioning granulosa-cell tumors of the ovary, and should not those which do function be called thecomas?

Dr. Ackerman: That is a good question because it has been demonstrated histochemically that probably the estrogen-secreting elements come from the thecal areas; that was demonstrated by Doctor Hertig and his co-workers.[23] They have seen nonfunctioning thecomas, and I am sure there must be nonfunctioning granulosa-cell tumors because unless you have theca-cell elements probably you will not have function. But the two are so intermingled that I am not sure that this rigid separation is necessarily indicated. From a practical standpoint, however, if you have a granulosa-cell tumor, you probably have a malignant neoplasm, at least potentially so, and with a thecoma, although there have been rare cases reported of malignant change occurring, such cases are rare indeed.

CASE 5

Diagnosis.—Soft tissue of neck, benign cyst of uncertain embryonic origin.

Contributor.—Dr. P. T. Flynn, Austin.

History.—A 43 year old white woman, on a routine physical examination October 1, 1951, was found to have a 3 by 7 cm., oval, slightly nodular, nontender mass beneath the lower right third of the sternocleidomastoid muscle. The mass was movable and not attached to the trachea. At the time of operation the muscle was split just above the clavicle and a 5 by 4 by 4 cm. oval cystic mass was found sharply circumscribed with a bosselated surface that was fairly adherent to the jugular vein. The mass was carefully dissected and removed in toto without rupture. Upon cut section the mass was cystic and readily collapsed. It was filled with a light green, creamy, homogeneous material which was fairly adherent to the lining. There were

numerous small papillary processes projecting into the lumen.

Submitted diagnoses.—Branchial cleft cyst, 24; papillary cystadenoma lymphomatosum, 14; muco-epidermoid cyst, 3; carcinoma, 3; syringocystadenoma papilliferum, 2.

Dr. Ackerman: Well, everybody finally worried their way down to a branchial cleft cyst; at least the majority did, and I can readily see why this diagnosis was made.

The lesion is made of epithelial cells which are squamous in nature and also mucus secreting as shown by the mucin stain. These cells are accompanied by lymphoid tissue which often shows germinal centers. No normal salivary gland, thyroid, or thymic tissue can be seen. Thymic cysts and cysts of the parathyroid (third and fourth branchial arches) have been seen in this area. Thyroglossal cysts are usually in the midline although rarely they have been reported away from the midline.[44] They may show mucus-secreting cells. This is certainly not a papillary cystadenoma arising from the salivary gland. Salivary gland tissue is not present and aberrant salivary gland tissue does not occur in this area. Furthermore, tumors of that nature do not contain mucin-secreting cells and the lymphoid tissue is clothed by oxyphil cells. This could be a branchiogenic cyst from the third branchial arch. I believe this lesion must be classified as a benign cyst of embryonic origin.

I think I should read part of a letter from Dr. A. P. Stout. Dr. Flynn sent this case to Dr. Stout, and he had a little trouble too. He made a study first of the cases of papillary cystadenoma lymphomatosum, and he found 43. Forty-one of those were in the parotid and 2 were in the submaxillary gland, and as I have indicated, there may be some question about those. Judging from the comments of Thompson and Bryant,[40] the tumors described in the submaxillary gland were possibly in that portion of the parotid gland which extends forward to overlap the posterior pole of the submaxillary gland. He had none in lymph nodes. Dr. Stout wrote: "Coming now to the histologic appearance of your tumor, the evidence is conflicting. First, if this is a cystadenoma lymphomatosum in a lymph node, we should be able to recognize it as a lymph node. This I cannot do. I see follicles but I can recognize no sinuses either marginal or elsewhere. In regard to the epithelium lining the cavities it is stratified columnar nonciliated." He does not know what is in those vacuoles, and I think that to some extent is the key to the diagnosis in this case. He said if he were in favor of the growth being a cystadenoma lymphomatosum, the cells in the basal layer have intracellular bridges and he has never seen that in a cystadenoma lymphomatosum. So, he said, "against a branchial origin is the fact that it is a papillary adenomatous growth, and I cannot find records of any such tumors arising from branchial elements." He really was not certain of the diagnosis and cast his vote for this being a unique example of a branchial papillary cystoadenoma of the lateral neck.

CASE 6

Diagnosis.—Thyroid, Hürthle-cell carcinoma.

Contributor.—Dr. Lauren V. Ackerman, Washington University School of Medicine, St. Louis.

History.—A 43 year old white woman had had a history of goiter for eighteen years. Eight years before a thyroidectomy was done and in the past three years she had noticed again gradual enlargement of her neck. A firm, irregular, nodular mass about 8 by 12 by 6 cm. was palpable just to the right of the midline of the neck in the area of the right lobe of the thyroid gland. The basal metabolic rate was +1 per cent.

Submitted diagnoses.—Hürthle-cell tumor, malignant, 16; thyroid carcinoma, 14; Hürthle-cell tumor, benign, 5; thyroid adenoma, 4; parathyroid carcinoma, 3; parathyroid adenoma, 2.

Dr. Ackerman: I never would blame anybody for calling this lesion benign because you can call it malignant only on the basis of invasion of the capsule and/or involvement by tumor thrombi within the veins. Fourteen called it cancer. Five put it in the parathyroid group. I can say that this is not parathyroid carcinoma on the basis of the microscopic changes. In the parathyroid carcinomas, of which I have now seen 4 or 5 cases, there are a trabecular pattern, mitotic figures, and no oxyphilic cells. Of course, I am talking about functioning parathyroid cancer. If you wish to call this nonfunctioning parathyroid cancer, the same things I said before would apply. As to the adenoma, this easily could be designated as an adenoma if you found no evidence of blood vessel invasion or invasion of the capsule. I do not diagnose malignant changes in an adenoma unless I see such invasion or such evidence of vein invasion.

This tumor of the thyroid is well differentiated, made up of uniform cells, with uniform nuclei. The cytoplasm is prominent and bright pink. The tumor forms masses of anastomosing tumor cells separated by blood vessels. True tumor thrombi within veins are present. These cells are Hürthle cells, and they can form distinctive tumors. However, these cells are often seen in thyroid glands of myxedema, exhaustion atrophy, and Hashimoto's struma and in thyroids previously subjected to roentgen rays.[11] This tumor is a Hürthle-cell tumor because of the character of the cells with the bright pink cytoplasm. It was large, well encapsulated, and tan colored. My section and some of the sections from the seminar also show true tumor thrombi within the veins. It was diagnosed as a Hürthle-cell carcinoma because

of invasion of the capsule and because of tumor thrombi within the blood vessels.

Frazell[10] reported 4 cases of Hürthle-cell cancer and Chesky[6] reported 25 cases. These tumors occurred in about three-fourths of instances in females with an average age of around 50 years. Often there was a fairly long clinical history, and grossly the tumors were frequently rather large, grayish-brown or tan. Grossly blood vessel invasion was not too rare and lymph node metastases were not infrequent. Microscopically there is apparently some correlation between the more differentiated tumor and a long clinical course. If osseous metastases are present, blood vessel invasion is invariably found. It is possible that in the case under discussion bone metastases may occur in the future. It seems possible that from reports of these cases the initial treatment of this rather rare variant should be radical. The decision as to whether radical neck dissection should be done must depend on the findings in an individual case.

The date of surgical excision in the present case was August 18, 1948. The patient was given postoperative irradiation. The opposite lobe was removed September 22, 1949, and no tumor was found. On October 28, 1948, a pea-sized subcutaneous nodule close to the previous operative scar was noted. This nodule gradually increased in size. Three nodules of tissue were removed on April 19, 1951. These were in the soft tissue of the neck and some of the tumor cells were apparently within the superficial cells of the veins. About June, 1950, a nodule seen in the lung was thought to be a metastasis. The patient was last seen August 19, 1952, with persistent tumor still present in the subcutaneous tissue. She was in good general condition. A roentgenogram taken at that time showed innumerable metastases.

Dr. Wilson G. Brown, Houston: What percentage of Hürthle-cell carcinomas are associated with hyperthyroidism?

Dr. Ackerman: As far as I know, none. I think few thyroid cancers are associated with hyperthyroidism; if hyperthyroidism is present, usually it is not related to the presence of the cancer. That is an important aspect because you may get a patient with hyperthyroidism and microscopically you may have an extremely hyperplastic gland with papillary enfoldings which scare you. Dr. William A. Meissner from the Lahey Clinic has seen patients with such prominent hyperplasia that the hyperplastic elements had extended beyond the capsule of the thyroid and had grown into the surrounding muscle. In a patient with extreme hyperplasia, Graves' disease, even if the hyperplastic elements extend beyond the capsule, that is not necessarily evidence of malignant change.

Dr. John H. Childers, Galveston: What have been your experiences with cases of carcinoma of thyroid gland receiving radical neck dissection prior to clinical appearance of metastases?

Dr. Ackerman: That is a good question. I have practically no experience with that. I would say, however, that in the consideration of radical neck dissection you have to take note of the type of tumor. In the first place, the undifferentiated cancers you will not be able to cure anyway, no matter what you do, and in the tumors that exactly resemble normal thyroid their spread is usually through the blood vessels. This question would apply, I think, to one of the commonest tumors, the papillary carcinomas of the thyroid gland. When you see patients with those tumors, you more frequently see a metastasis in a lymph node without evidence of a tumor in the thyroid, than a tumor in the thyroid without evidence of involvement of regional lymph nodes. The life history of papillary carcinomas is very long; I know of a doctor's wife in St. Louis who has been living for twenty years with this tumor. So, it is going to be difficult to evaluate any form of treatment, whether it be roentgen-ray therapy or immediate radical neck dissection. I do know there have been a few cases subjected to operation in the St. Louis area in which the regional lymph nodes have not been palpable and in some of those cases metastases have been found. I think that there would be a number of instances in which you would not be able to palpate the regional involved lymph nodes. Usually these patients are young. Often they are females, and if you do a radical neck dissection on a female without palpable lymph nodes, there is going to be a protest. Recently Dr. Charles Eckert devised a procedure in which he divides the sternocleidomastoid muscle and does the radical neck dissection. He does that on the basis that we have never seen direct invasion of the sternocleidomastoid muscle by a papillary tumor. So, if you had a papillary carcinoma localized apparently in a lobe of the thyroid gland, I would not argue too strongly with anybody who would want to do a radical neck dissection, although I would not know whether the number of times you would find regional involved lymph nodes would warrant that procedure. I do not believe anybody has answered that question.

Dr. C. D. Fitzwilliam, Fort Worth: Do you consider venous invasion an absolute indication of malignancy in a tumor of endocrine glands?

Dr. Ackerman: I will only say this, that I think there is a certain parallelism between the islet-cell tumors, parathyroid tumors, tumors of the adrenal cortex, and thyroid neoplasms. I have noticed in all

of those tumors that it is not unusual to have cells free-floating within the vessels, and in the follow-up of the parathyroid tumors, about which I have the most information, that finding is not significant. Whenever tumor thrombi such as we demonstrated here are present, I would say that that is a significant finding and might indicate a fair chance the patient might get into trouble in the future. I think that when I see tumor thrombi I should classify the lesion as malignant. There are 2 cases of islet-cell tumors that I know about. One was a case reported by Dr. Whipple in which an islet-cell tumor with venous tumor thrombi was resected and then more than five years elapsed before a metastasis appeared in the liver. We have a case of islet-cell tumor with tumor thrombi in the veins in which after a five-year period tumor appeared in the liver and caused the death of the patient. We have another patient with a cortical tumor of the adrenal with tumor thrombi in whom after about two years metastases appeared in the lung. I think if you just have a few cells floating in the vessel, I would write it down in the report, but that would not be an indication to me of something bad that is going to happen.

I would like to know if anyone in this audience has any tumors of any of those organs in which the only finding of malignancy was a few cells floating in the veins and in which after a period of time metastases appeared? Well, that is good; it makes me feel better to know that your experience has not been different from mine.

Col. C. J. Farinacci, Denver, Colo.: What would be the procedure of choice in handling of thyroid nodules: (a) frozen section or not and (b) if malignant, hemithyroidectomy alone or with radical neck dissection?

Dr. Ackerman: We have finally evolved this procedure at Washington University. If you have a single nodule in the thyroid gland in a patient who does not have evidence of hyperthyroidism, there is a considerable chance that that thyroid nodule may be cancerous—that chance runs from 1 out of 10 to 1 out of 4, according to whose statistics you are quoting. If you have a single nodule, it can be cancer, a benign tumor, or an adenomatous nodule, and nobody can tell you what it is. This patient that you are talking about I assume has no palpable lymph nodes. If the surgeon explores that thyroid and he finds that the nodule is confined within the substance of the thyroid, that is one thing. If he finds it growing outside in the muscle and you take a frozen section of the tissue in the muscle, then the diagnosis can be made easily. But if the lesion is in the substance of the thyroid, I do not see how frozen section is going to help. I think that the surgeon can excise that nodule either by hemithyroidectomy or by an adequate margin of thyroid tissue and then it will not matter what the diagnosis is. The decision will be only whether or not to do a radical neck dissection. I do not believe it is necessary to make that decision at that moment. So, that has been our procedure. On the contrary, I think it is wrong for a surgeon, given a single nodule in the thyroid, to decide it looks benign and to enucleate it because it is much easier than doing a hemithyroidectomy. This is all right if it proves to be benign, but if it is cancer, you have spread cancer over the entire operative field.

Dr. J. I. Mossberger, Denver: Would you please comment on the origin of the Hürthle cell?

Dr. Ackerman: The Hürthle cell to me is not a special cell. It comes from the thyroid and as I understand it there are no interfollicular cells. These oxyphilic cells are often seen in the thyroids of patients with myxedema, exhaustion atrophy, and Hashimoto's struma, and in thyroid previously subjected to roentgen-ray therapy. I think that the Hürthle cell as such is a cell that comes from the thyroid itself.

CASE 7

Diagnosis.—Lymph node, cervical; reticulum-cell sarcoma.

Contributor.—Dr. A. O. Severance, Baptist Memorial Hospital, San Antonio.

History.—The patient, a 55 year old housewife, was admitted to the hospital in October, 1951, for intense pain in the back radiating into the right leg. She also complained of gradually increasing weakness and moderate weight loss for the past year. In 1948 she had had a hysterectomy, the indication for which was unknown. Results of the pathologic examination of tissues removed was unknown. At that time (1948) a moderate anemia and marked leukopenia was noted. Red blood cells numbered 3,720,000 per cubic millimeter; hemoglobin was 11.5 Gm.; white blood cells were 1,750 (polymorphonuclear leukocytes 41 per cent, lymphocytes 59 per cent). Since that time every blood count has shown leukopenia, the leukocytes varying from 1,000 to 2,600. The differential was approximately the same, and showed a persistent relative lymphocytosis (up to 72 per cent lymphocytes) and occasional relative monocytosis (up to 25 per cent monocytes). The anemia became more severe, and a low count of red blood cells 1,970,000 and hemoglobin 7.1 Gm. was recorded in September, 1951. Repeated blood transfusions had a moderate effect, and the red blood cell count was brought up to 2,700,000. Liver and spleen were not palpable. A roentgenogram of the spine showed old compression fractures of the second and fourth lumbar segments. The question of metastatic bone involvement from a carcinoma of the thyroid gland was raised because the patient had a nodule in the thyroid. This nodule clinically did not appear as a malignancy. A bone marrow specimen was interpreted as indicative of severe hypoplastic anemia. The patient had no fever. After her discharge from the hospital the condition of the patient deteriorated rapidly, and in December, 1951, the liver became palpable 1 cm. below the costal margin and the spleen 3 finger-breadths

below the costal margin. The patient also developed a low grade fever. She died December 23, 1951, with signs of cerebral hemorrhage.

Submitted diagnoses.—Malignant lymphoma, 16; leukemia, 7; Hodgkin's disease, 7; reticuloendotheliosis, 7; inflammatory node, 1; myeloid metaplasia, 1; metastatic carcinoma, 1; histoplasmosis, 1; hypersplenism, 1.

Dr. Ackerman: I think that malignant lymphoma is always a good diagnosis and I will be frank to say that I use this as a diagnosis at times. I am in agreement with Custer[9] that the giant-cell lymphoma may become lymphosarcoma or may have the blood picture of lymphatic leukemia. I am in agreement that Hodgkin's sarcoma, reticulum-cell sarcoma, and monocytic leukemia are closely related and the exact breakdown is not necessarily indicated. I have not seen giant follicle lymphoma become Hodgkin's disease. Neither have I seen Hodgkin's disease become leukemia. If you have histoplasmosis, usually you get granulomatous areas; whenever I have missed a case of histoplasmosis, I see the organisms in every lymph node section I look at for quite a while afterward. The only way I avoid overdiagnosing the lesion is to keep handy a section which shows unequivocal histoplasmosis. Of course, you may have peripheral manifestations with histoplasmosis, usually in the form of granulomatous lesions which suggest Boeck's sarcoid without evidence of the organism, and you often find those organisms in the bone marrow and adrenals. I think this could be classified perhaps as a malignant reticuloendotheliosis. I think whether you call it that or whether you call it reticulum-cell sarcoma does not make too much difference.

Section of the lymph node showed complete obliteration of the architecture and replacement by cells with prominent nuclei, prominent nucleoli, and pink cytoplasm. Mitotic figures are common; some of these figures are abnormal. These tumor cells often show phagocytosis, and tumor is extending beyond the capsule into the perinodal fat. There is some variation in the cellular infiltrate. There is no evidence of acinar formation and the cells are not growing in sheets such as you see in a carcinoma. There are also no Reed-Sternberg cells. We would therefore be left with the diagnosis of reticulum-cell sarcoma.

There is close relation between monocytic leukemia, Hodgkin's sarcoma, and reticulum-cell sarcoma. The malignant cell of Hodgkin's disease is the reticulum cell, and when Hodgkin's sarcoma becomes highly undifferentiated, I am unable to distinguish between Hodgkin's sarcoma and reticulum-cell sarcoma. Monocytic leukemia has a rather typical clinical onset, is usually acute, and is associated with hemorrhagic phenomena and involvement of the lymph nodes and other organs, particularly those of the reticuloendothelial system. There is also another variant in which there may be diffuse involvement of bone, liver, and spleen, which you might label as malignant reticulosis. Mycosis fungoides with its long clinical duration and formation of skin nodules often terminates with visceral involvement by reticulum-cell sarcoma. What determines the form of the malignant process arising from reticulum cells is, of course, unknown. These variations remind me of the variable picture which may be present in tumors originating in plasma cells.

This patient died and had infiltration in many organs including the kidney, which shows the same type of infiltrate. Some of these cells, which I believe are reticulum cells, show evidence of phagocytosis. Evidence of phagocytosis in a cell does not mean it is not a tumor cell. I have seen phagocytosis by reticulum cells in reticulum-cell sarcomas of bone. This, however, is a very diffuse process.

We will go ahead with the next case and leave the discussion for both cases.

CASE 8

Diagnosis.—Brucellosis with extreme hyperplasia of the reticuloendothelial cells.

Contributor.—Dr. A. O. Severance, Baptist Memorial Hospital, San Antonio.

History.—The patient was a 10 year old boy whose youngest brother had one lung removed when he was 9 years of age. There was no history of familial diseases. The patient's birth and feeding habits were normal. He had always been "shaky," he was left handed, and his family thought he was just "nervous." At the age of 4 he drank raw milk in Oklahoma.

The first admission to the hospital was for fever, muscle aches, and backache. Physical examination showed pale skin and occasional cyanosis, palpable cervical lymph nodes, tremor in the hands, and ulcerative pharyngitis. The patient ran a febrile course in the hospital and was discharged as improved with a final diagnosis of brucellosis.

The second admission to the hospital, three months after the first, was for cough and severe respiratory distress, anorexia, pedal edema, and "lumps" in the neck. Physical examination revealed an ashen-colored cyanotic child who appeared extremely irritable. A lump of about 2 by 1.5 cm. was visible and palpable on the mid forehead. There was a bluish swelling across the bridge of the nose. Ankles and abdominal wall showed 3 plus edema. The heart was questionably enlarged; sounds were indistinct with murmurs. The lungs were filled with harsh rales. The liver was 3 fingers below the costal margin, and the tip of the spleen was palpable. Anterior and posterior cervical nodes were markedly enlarged.

The patient ran a septic type of temperature while in the hospital. Symptoms regressed under strenuous therapy, but returned and the patient ran a downhill course and died twenty-five days after admission to the hospital and four months after onset of the symptoms.

Serial roentgenograms of the chest showed evidence of congestion and perihilar infiltration. Skull roentgenograms were negative.

Red blood cells varied from 4,920,000 to 2,650,000. White blood cells varied from 5,300 to 2,350 with a slight shift to the left. Studies of the urine were negative except for an occasional pus cell and hyaline cast. Agglutination

test results were as follows: typhoid H and O and paratyphoid A and P, negative; Proteus OX19, negative; brucellosis titer 1:320, 1:320, 1:80. Spinal fluid tests were negative. Bone examination showed suppression of segmented and stab cells, stimulation of myelocytes and nucleated red cells; no leukemia was evident. Lymph node biopsy suggested Letterer-Siwe disease.

Submitted diagnoses.—Leukemia, 9; reticuloendotheliosis, 9; malignant lymphoma, 8; brucellosis, 5; Letterer-Siwe disease, 4; Hodgkin's disease, 2; granuloma, 2; myeloma and plasmacytoma, 2.

Dr. Ackerman: Again, I think leukemia, reticuloendotheliosis, and malignant lymphoma are good diagnoses, and I think this lesion falls into this group.

It seems apparent with the passage of time that the diseases given the names eosinophilic granuloma, Hand-Schüller-Christian disease, and Letterer-Siwe disease are interrelated. Lipid deposits are not present within the cells except in chronic lesions. Eosinophilic granuloma is usually restricted to those cases in which there is a single bone lesion. However, I have seen such cases with single bone lesions on two occasions progress to the clinical picture of Hand-Schüller-Christian disease, and I am particularly suspicious of such a progression when there is a single bone lesion in a very young child. So, the age of the patient seems to bear some relation to what you get. The criteria for Letterer-Siwe disease have included an acute fatal course occurring in a child, (this patient was a little bit old, 10 years), skin lesions, enlargement of the spleen and liver, hemorrhagic diathesis, generalized lymphatic enlargement, progressive anemia, usually a normal leukocyte count, localized skeletal tumors, and proliferation particularly in the spleen, liver, lymph node, thymus, skin, and bone marrow. The typical cells are usually large, measuring 30 to 50 microns; they may be irregular, round, oval, or polyhedral; nuclear membrane is distinct; phagocytosis is not unusual and it was present here. This case to me is not classical Letterer-Siwe disease because of the age of the patient and the absence of skin changes. However, such cases have been reported previously, and I do not think we have to restrict our diagnosis to the criteria I mentioned. I see no reason why we cannot have certain variations, and I have shown you these lymph nodes of a Hand-Schüller-Christian disease and Letterer-Siwe disease which have great similarity. As a matter of fact, if I got a lymph node or a lesion with, let us say, eosinophilic granuloma in Hand-Schüller-Christian disease, I would be hard put to it to make the clinical diagnosis. I think I would have to have the clinical findings.

The section shows that the architecture of the lymph node has been destroyed. The principal cell present is a rather large cell with a vesicular nucleus and fine chromatin. The cytoplasm is pink and often the cells are rather large. Mitotic figures are few in number. The process extends beyond the node into the perinodal fat. No Reed-Sternberg cells can be identified, and there are no true granulomatous areas.

It would be tempting to diagnose this lesion as Hodgkin's disease because of the obliteration of the architecture, the extension of the process into the perinodal tissue, and the mitotic figures. Against this diagnosis, however, is the fact that these cells are well-differentiated reticulum cells. I suspect that cytoplasmic fat is absent. I therefore believe that this case falls into the group of nonlipoid reticuloendotheliosis.

Now I would like to have Dr. Severance review the findings.

Dr. A. O. Severance, San Antonio: These 2 cases are from a series of 5 cases of malignant reticulosis which my resident, Dr. Robert Hausman, collected from the files of the Baptist Hospital over a five-year period. They were all much alike in the clinical picture and in the microscopic and gross findings at autopsy. The bone marrow was completely necrotic in some areas.

At the autopsy these 2 or 3, I cannot remember now but I think 2, vertebrae in that first case of a 55 year old woman were yellow and necrotic, and Dr. Hausman and I were worried about a metastatic tumor. The patient had a nodule in the thyroid and clinically by roentgen ray it was diagnosed as metastasis to the vertebrae. However, microscopically, as you saw, there was no carcinoma there; it was just necrosis. The cells in the bone marrow nearby, however, around the areas of necrosis were similar in appearance to those in the lymph node and in the spleen, and even the liver showed a few of these scattered cells in the sinus areas. Dr. Hausman and I interpreted these cells like Dr. Ackerman as reticulum cells. The typical phagocytes showed red cells and nuclear fragments. The distribution of these cells in the lymph nodes and other organs of the body were as you saw, and even that little aggregation in the kidney. This is still a 55 year old woman. How to interpret this case?

The history was of some two and one-half years' duration, the patient gradually going downhill, transfusions and other supportive treatment giving only temporary relief. The reason for the diagnosis of malignant reticulosis in contrast to a possible diagnosis of reticulum-cell sarcoma was that the cells did not seem to form aggregates. They seemed to have a diffuse infiltrating pattern like you would expect in leukemia. In fact, Dr. Hausman's theory on malignant reticulosis may be different to that of others. His theory is that malignant reticulosis is in fact a malignant manifestation similar to leukemia and is

a leukemia of the reticulum cells. That is perhaps why it has such a pecular distribution. The cells individually do appear to be malignant cells of reticulum type. They show scattered mitoses, and they do vary in size and shape.

Now, the second case, the little child, had a much more rapidly fatal course. We were worrying about leukemia in that child until we did a biopsy of a lymph node, and with our previous experience on some of these other cases we switched over from the tentative idea of leukemia which the clinicians were worrying about to a form of malignant reticulosis which in this child, we thought, we could call Letterer-Siwe type. The bone marrow in this child did not have areas of necrosis like that of the 55 year old woman. It was a bone marrow that showed some suppression of the granulocyte as did the other bone marrow. In the bone marrow aspiration study, I thought that we were dealing with just suppression of the granulocyte series, and in one case a suppression also of the nucleated red cells, but I saw increased numbers of cells that I labeled as monocytes. Dr. Hausman thinks I was calling monocytes something he would have called reticulum cells, but since he did not see the bone marrow he could not say for certain. He reviewed some 200 articles in the European literature and abstracted these articles and incorporated some of them into his thesis.

Dr. Ackerman: I am in agreement with Dr. Severance. There is little in the English literature about this entity, although there are articles in the European literature and the English literature.

Col. C. J. Lind, Fort Sam Houston: Harold Downy, who was really a histologist rather than a hematologist, in the 1930's was interested in the reticulum cell and reviewed the literature pretty well. I think you will find something in his handbook on this entity of reticuloendotheliosis. We had several cases that seemed to run quite a gamut from this into more or less a sarcoma type picture, and we all thought that they were frankly malignant lymphomas in a broad sense.

Dr. Ackerman: I have left my discussion in this case, for I feel that it illustrates the way an error can be made in this lesion. I believe that the correct final diagnosis is brucellosis.

Dr. Lowbeer, a recognized authority,[20, 21] reviewed the sections on case 8 and felt this was an unequivocal instance of brucellosis. He cited that this 10 year old child had been exposed to raw milk ingestion and on three occasions there had been serum dilutions for brucellosis and agglutination from 1:80 and 1:320. Clinically, there was persistent leukopenia with relative lymphocytosis associated with high intermittent fever. This is characteristic of brucellosis but not of Letterer-Siwe disease in which neutrophilic leukocytosis is common. Negative cultures do not speak against brucellosis because the organisms are notoriously difficult to culture. In the lymph nodes and spleen there was tremendous proliferation of reticuloendothelial cells which was diffuse in lymph nodes and spleen and focal in liver, lung, and bone marrow approaching neoplastic proportions. Dr. Lowbeer quoted many references illustrating the tremendous reticuloendothelial cell proliferation which can occur in brucellosis. Brucella organisms are intracellular parasites which are destroyed by some macrophages but manage to survive in others. In summary, he stated, "This patient certainly had brucellosis as well as a universal proliferation of the cells of the reticuloendothelial system of hyperplastic and perhaps dysplastic, but questionably neoplastic proportions. The relationship between the brucellotic infection and a powerful stimulation of the reticuloendothelial system has been established; and therefore this case presents one of subacute or chronic brucellosis causing—in a young child—a universal stimulation of reticulum cells of almost neoplastic proportions."

CASE 9

Diagnosis.—Skin, back; chronic granulomatous process, etiology unknown.

Contributor.—Dr. J. M. Moore, Santa Rosa Hospital, San Antonio.

History.—A 55 year old man five years ago had a large, elevated lesion on the thigh which was excised. The area of excision was skin grafted. Two years ago a large, irregular lesion appeared on the back. This was elevated, reddish blue in color, and showed evidence of ulceration. This was subjected to biopsy.

Submitted diagnoses.—Mycosis fungoides, 25; nonspecific infections, 7; lymphosarcoma, 5; leukemia cutis, 3; melanoma, 2.

Dr. Ackerman: There are a few with me but not many. I think we would all agree that this is not a melanoma. It would be unusual to have leukemia as a single nodule. I would think of lymphosarcoma, whenever it involves the skin, as having pretty homogeneous replacement by tumor cells.

The surface of the epidermis is almost completely ulcerated and all areas are replaced by an infiltration which shows numerous giant cells. There is also, however, a rich infiltration of reticuloendothelial cells, plasma cells, and unidentified cells. Mitotic figures are fairly abundant. No Reed-Sternberg cells can be identified.

In the first place there is no evidence that this is a squamous or basal-cell carcinoma. Neither is there any evidence of malignant melanoma. We are concerned primarily whether this is some inflammatory process or a neoplastic process. In favor of inflam-

mation is the large number of giant cells, plasma cells, and occasional eosinophils. If this is a neoplasm, it must be a malignant lymphoma. Against malignant lymphoma is the presence of numerous giant cells. These giant cells are the type seen in foreign body reaction and often several are found together. There is considerable foreign body material within these giant cells. Also the cells present show excessive reticuloendothelial proliferation and many plasma cells. Mitotic figures are infrequent.

The clinical history is not that of mycosis fungoides. Mycosis fungoides usually is preceded by skin changes and then progresses to nodules and finally may become disseminated reticulum-cell sarcoma. Naturally we would like to be able to see the previous skin lesion. I heard this patient has developed another nodule. Is that correct?

Audience member: That is correct.

Dr. Ackerman: Where is the other nodule?

Audience member: It is in the region of the previous nodule.

Dr. Ackerman: Previously there was another lesion excised. Have you ever been able to get hold of those sections?

Audience member: No, we have not.

Dr. Ackerman: If this is mycosis fungoides, this is a very peculiar history. Perhaps we have missed it. I am sure that the follow-up of this case is going to be the determining factor in the diagnosis, and this is the type of case in which I think it is so important.

CASE 10

Diagnosis.—Soft tissue, leg; giant-cell tumor (probably malignant).

Contributor.—Dr. P. T. Flynn, Austin.

History.—The patient is a 27 year old Latin-American woman. On March 3, 1948, four years before the present admission, roentgen ray showed a large area of irregular bone destruction measuring 9 cm. in length and 6 cm. in width, involving the lower end of the femur and the entire lateral condyle. There was a definite expansion of the bone anteriorly, laterally, and posteriorly with an abrupt break in the cortex along the lateral aspect. Some bone was present in this area of destruction, giving it a faint silk-bubble appearance which was in favor of a giant-cell tumor. The break in the cortex was more suggestive of osteogenic sarcoma. At operation March 13, 1948, there was found cystic degenerative bone with space filled with blood clots. The area was subjected to thorough curettage. The pathologic diagnosis was giant-cell tumor. The patient was discharged April 16.

The patient developed a recurrent tumor of the left lower femur, and on December 17, 1949, was subjected to another operation. Under the skin of the lateral condyle of the femur superficial to the iliotibial band was a well-encapsulated, 2.5 cm., circumscribed, reddish brown, rubbery nodule. The lateral cortical bone was friable as was the condyle, and the tumor cavity contained large amounts of hemorrhagic granulation tissue. The diagnosis was giant-cell tumor recurrent in the femur and giant-cell tumor of the soft parts due to implantation of the previous operation. The patient subsequently was discharged and did well at home, although the joint was ankylosed as the result of swinging a piece of the tibia into the femur.

The present admission occurred March 26, 1952, after the patient noticed nodules developing in the line of excision. Physical examination revealed nodules, approximately seven in number, along the line of excision, some of which measured as much as 5 cm. in diameter clinically.

Gross pathology: The specimen consists of an elliptical piece of skin measuring 15 by 3 cm., on the surface of which is a well-healed scar. There are multiple tumor nodules dispersed along the line of the scar immediately beneath the skin and ranging up to 7.5 cm. in greatest diameter. Some nodules were buried deep in muscle at the time of operation. A wide local excision had been planned originally, but the tumor was accidentally entered, so that the present incision site undoubtedly is seeded with tumor cells.

Submitted diagnoses.—Giant-cell tumor, benign, 20; giant-cell tumor, malignant, 12; osteoclastoma, 3; osteogenic sarcoma, 2; dermatofibrosarcoma, 1.

Dr. Ackerman: In the diagnosis of bone lesions, as I have said many times, I believe roentgen rays are shadows and pathology is substance. There is no radiologist, no matter how accurate, how knowledgable, or with how much background in pathology, that can make certain diagnoses on many lesions of bone. In other words, there are many pathologic lesions which can cast similar shadows, and the radiologist who is dogmatic in his diagnosis does not know any pathology. I think at times it is easy to make mistakes in calling a lesion of bone benign when it is malignant, and vice versa. The diagnosis must rest on obtaining adequate material from the lesion and having it properly prepared. The radiologist will be more accurate than the pathologist if adequate material is not submitted and if the pathologist does not make good sections of the material which he receives. I think in this lesion the radiologist probably would make the diagnosis of giant-cell tumor and perhaps suggest that it could be malignant because there is some suggestion of perforation of the cortex.

The section shows a fairly well-defined nodule growing in the dermis. It is made up of large numbers of giant cells of the type usually observed in a giant-cell tumor. The stroma is vascular and rather cellular. Individual cells are uniform and show only rare mitotic figures. It is interesting that on the periphery of the lesion bone is being formed.

At the time of operation there was a break in the cortical bone. The lesion was treated by thorough curettage on March 13, 1948. A lesion beneath the skin in the region of the lateral condyle was removed on December 17, 1949. Twenty-one months after the original operation there was apparent persistent

tumor within the femur. Again the lesion recurred in March, 1952, which was about twenty-seven months after the second operation and four years after the first operation. This patient apparently then had microscopically a benign giant-cell tumor which had maintained its benign pattern, which had persisted for a four year period, and which apparently had been inadequately excised. There appears to be little doubt that tumor still remains. I have seen a lesion of this microscopic pattern which has metastasized to the lung. The history of this patient is as follows:

At the age of 43 the patient had a tumor involving the distal end of the radius which apparently had characteristic roentgen changes of a giant-cell tumor. For some reason unknown to me, the arm was amputated half way to the elbow; it has not been possible to obtain the sections on this amputation. Four years later the lesion was identified within the lung. This was resected and microscopically looked like a benign giant-cell tumor. The date of this resection was April 16, 1945. On February 22, 1947, was resected another single lesion of the lung which showed no difference. The patient was last seen October 10, 1952, and was free from evidence of disease.

I also have seen a case in which a giant-cell tumor of the vertebra which looked benign metastasized to the lung after trauma. More commonly than the previous evolution, the stroma undergoes malignant change and becomes fibrosarcoma. I feel in the present case that tumor still remains in the leg and, if something radical is not done, that this lesion will metastasize to the lung and kill the patient. I therefore would recommend amputation at this time.

Col. A. M. Richmond, Fort Sam Houston: Is grading of these tumors based on stromal changes as suggested by Drs. Jaffe and Lichtenstein[19] of value?

Dr. Ackerman: I would say, "Yes." I would say also, as I indicated, that multiple sections should be made. If the tumor is obviously malignant at the time of the first operation, I would seriously consider amputation. But if the tumor was only doubtfully malignant, then I would be content with the curettement procedure.

Col. C. J. Lind, Fort Sam Houston: Where would you amputate?

Dr. Ackerman: The tumor is about 10 inches above the knee joint. You probably would have to disarticulate. I would like to have you give the follow-up on this case, Dr. Flynn.

Dr. P. T. Flynn, Austin: This patient, I believe, was seen in March, 1952, with these local skin recurrences. She was seen by a number of surgeons, most of whom agreed at that time that they were going to be unable to take out all of the tumor nodules by wide local excision. However, there were a few braver souls who went ahead and attempted it. As soon as they got into the leg they were cutting into tumor nodules. Then they had to take the remainder of the soft tissue and get as many nodules out as they could. Having scraped the bone again, they slipped a tibial graft up into the femur. The patient at first refused postoperative irradiation and was discharged from the hospital. About five days later she was in an automobile accident and fractured her ankylosed joint. Since that time she has been in a cast primarily because of instability of the knee joint. She has received now a total of 3,800 r. Clinically it is not possible to tell if there has been any more recurrence primarily because of hip spica, but radiographically none has been noticed. They do not anticipate any change in such a short period of time. It has been only about four months since irradiation therapy.

Let me go back—in 1948 when the patient came in a chest roentgenogram was made to see if she had any metastases that possibly might be an osteogenic sarcoma. Fortunately, the left humerus was included in the chest film and no cystic lesion was found in the left humerus. In 1950 she came in with a recurrence in the soft tissues and in the lower end of the femur. A bone survey was done and this cystic lesion was picked up in the left humerus. She had another complete bone survey in March, 1952, and the radiologist thought that the cyst in the left humerus was exactly the same size as before. We thought possibly that she might have osteitis fibrosa cystica in view of the fact that the lower end of the tibia began to show cystic lesions, her blood calcium measured 12 mg. per 100 cc., phosphorus was about 3.7 mg. per 100 cc., and the alkaline phosphatase activity was under 2 units per 100 cc. That is the case up to date.

Dr. Ackerman: I would say that this could not be hyperparathyroidism on the basis of the normal alkaline phosphatase, because if a patient has bone lesions with hyperparathyroidism, the alkaline phosphatase invariably is elevated because the cystic bone lesions that are present are merely a reflection of the advanced bone lesions. All other bones also show some abnormality. The lesion that is in the humerus I would say had nothing to do with the lesion under discussion. If there is mental distress about it, an easy way to find out what it is, is to subject it to biopsy. I would also say, agreeing with Dr. Flynn, that the procedure done by the surgeon was a piecemeal removal of the tumor. I would be in strong and fervent disagreement with this procedure, for the surgeon is operating through tumor, stirring up the tumor bed and perhaps pushing tumor into the blood vessels. I would have felt at the time this recurrence

appeared that you should prove it by careful incisional biopsy. Then I think at that time you could have gone ahead with amputation. At present you do not know where you are, but the chances are fairly good that you are in a pretty bad state of affairs. Because the patient already has a fracture and probably has persistent tumor, it is doubtful whether the irradiation has sterilized the tumor, and certainly in the presence of fracture plus irradiation, that is not a very good leg any more. At present it has probably lost a great deal of its intrinsic beauty, so I think perhaps the patient at this moment of time might be willing to trade it for an artificial leg because I also suspect that she is going to have continuing disability regardless of the presence or absence of neoplasm. So, I would still be in favor of amputation, and if it is not done, then I would predict that this patient will suffer from the effects of the tumor and that she has a very good chance of developing pulmonary metastases.

CASE 11

Diagnosis.—Chorioadenoma destruens.

Contributor.—Dr. L. J. Manhoff, Jr., Robert B. Green Hospital, San Antonio.

History.—This 23 year old woman passed a hydatidiform mole after having missed three menstrual periods. A dilatation and curettage was done and she had no further difficulty. She was next seen in the clinic two months later at which time her uterus was moderately enlarged to approximately the size of a three-month gestation, and there were small bilateral cystic masses in both adnexa. For the preceding ten days she had had irregular bleeding and stated that she had passed small pieces of tissue. She was still secreting breast milk although she was not nursing a baby. A hysterectomy and left salpingo-oophorectomy were done four days later. The uterus was moderately enlarged and at the fundus there was a small friable nodule of pinkish and reddish tissue which measured about 5 mm. in diameter. On serial sagittal section this reddish tissue seemed to extend into the myometrium for a depth of about 1.5 cm. In the accompanying ovary there were 3 corpus luteum cysts.

Submitted diagnoses.—Decidua (degenerated, retained products of conception, and so forth), 14; choriocarcinoma, 12; hydatidiform mole, 4; syncytial endometritis, 4; decidual endometritis, 3; chorioadenoma destruens, 3; chorioma, benign, 1.

Dr. Ackerman: I believe there were 12 persons who thought it was a malignant lesion. Is the person here who gave us this case? Do you have the follow-up now?

Dr. Manhoff: We have a follow-up at eighteen months and she is perfectly well. There is no evidence of recurrence. Her chest plate was negative.

Dr. Ackerman: I think that if this were a choriocarcinoma the chances are almost 100 per cent that the patient would be dead within a six months' period. I believe there is enough evidence now to show that this is a benign lesion.

Sections of the uterus show active trophoblastic cells with giant nuclei and associated with well defined chorionic villi. This patient passed a hydatidiform mole. Two months later the uterus was enlarged and for the preceding ten days she had had irregular bleeding. I do not see any record of chorionic gonadotropin. However, the presence of chorionic gonadotropin is not an indication of choriocarcinoma but merely an indication of trophoblastic activity. Usually the titer following the passage of a hydatidiform mole is normal by ten weeks. It, therefore, would not have been unusual to have had chorionic gonadotropin present at this time. Furthermore, the elevation may continue for even longer time periods. However, if the titer of chorionic gonadotropin increases, this suggests that trophoblastic tissue is increasing.

Of course, it must be realized that choriocarcinoma in itself is an extremely rare lesion. If it follows hydatidiform mole, death occurs in a short time. There is little doubt that this lesion is frequently over diagnosed. There is also the possibility that if a patient has choriocarcinoma, by the time diagnosis is made death is inevitable. There are also cases of regression of local nodules and even pulmonary metastases.[29] As has been emphasized, the presence of chorionic villi is usually, but not invariably, evidence that the lesion is benign. There is a type which has been designated as chorioadenoma destruens, a form of invasive hydatidiform mole, in which the process can even reach the serosa, perforate into the broad ligament, but still remain localized. There is fairly deep penetration in this case.

Dr. W. R. Mathews, Shreveport: If you had a nodule of chorioadenoma in the vaginal wall and the latter had been removed with healing, would you advise hysterectomy if the uterus was not enlarged and if there was no evidence of hemorrhage?

Dr. Ackerman: There have been a number of cases reported in which that sequence of events has taken place. I think I would be in favor of doing nothing.

Dr. M. L. Trumbull, Memphis, Tenn.: Would you make such a diagnosis in the absence of chorionic villi?

Dr. Ackerman: I think the chorionic villi are the most important part of this diagnosis.

Dr. Trumbull: Rule out syncytial endometritis.

Dr. Ackerman: In this group of lesions the only one of importance is choriocarcinoma. Of course, chorioadenoma destruens might be placed in a separate group because it has really a pretty definite gross appearance. Those lesions such as were shown

here and have been reported by others can even extend outside the uterus and still nothing does happen. There was a case reported like that.

Dr. Wilson G. Brown, Houston: Do you consider invasion of the villi by trophoblasts as a criterion for malignant chorio-epithelioma?

Dr. Ackerman: All I can say in answer is that Dr. Hertig[14] said that scared him, but I do not believe you could be certain either. Again, the worse the mole might look, the greater the chances that choriocarcinoma is present. I think the most important point in the whole discussion of these cases is that the tendency always is to remove the uterus. I am under the impression that at Barnes Hospital there are many uteri removed that do not need to be removed, and I am not certain that if you did nothing, you would not be just as far ahead. In other words, I rather go along with the old German pathologists who believed that if you have a choriocarcinoma, probably it makes no difference what you do.

Dr. B. F. Stout, San Antonio: What is the incidence of choriocarcinoma at Barnes Hospital?

Dr. Ackerman: The incidence of choriocarcinoma during the past five years in St. Louis is 3 cases as far as I know. This disease is rare except in the Philippine Islands and Indonesia where choriocarcinoma is a common disease. By common I mean it is killing the patients so I think it is perfectly bona fide. Dr. Manuel Penas in Manila is going to write up the cases there, and the pathologist, Dr. Sutoma from Indonesia, who is a fine pathologist, has written to me about the high incidence of choriocarcinoma there. From the standpoint of true choriocarcinomas, those that are going to kill the patient, I suspect that even in the very large cities (St. Louis is a pretty large city), the number of cases will be very few. I would like to know the number in San Antonio that you know of, Dr. Stout, that killed the patient.

Dr. Stout: I know of none.

Dr. A. O. Severance, San Antonio: We had at Brooke Army Hospital during the war one case in which we found villi in the curettage. Then about a year later or maybe less, physicians at the Armed Forces Institute of Pathology found the lung metastases at autopsy.

Dr. Ackerman: Exceptions occur.

CASE 12

Diagnosis.—Von Recklinghausen's disease with malignant schwannoma.

Contributor.—Dr. C. F. Pelphrey, Austin.

History.—The patient was a 39 year old white woman of dark complexion. Since infancy she had had generalized tumor nodules which became prominent and more numerous at 12 or 13 years of age. During the past five years she had had several lesions removed from her hands, face, chest, and back which were diagnosed as neurofibromas, and there was never any local recurrence. No other member of the family had such lesions although some members had olive complexion and had had migraine headaches. Other than migraine headaches and an appendectomy, the patient had had no serious illness in the past. She first noticed tenderness in the right side, then developed pain and weakness in the leg. At surgery a retroperitoneal mass was found and partially removed. The specimen measured 10 by 8 by 10 cm.

Submitted diagnoses.—Neurogenic sarcoma, 9; neurogenic fibrosarcoma, 7; neurofibrosarcoma, 6; fibrosarcoma, 8; malignant schwannoma, 3; leiomyosarcoma, 3; malignant neurilemoma, 1; neurofibroma, 1; angiomatosis, 1.

Dr. Ackerman: A good many pathologists put this tumor into the malignant group, and I think we have enough evidence of its malignant nature to take it out of the benign group. I think this differential diagnosis is difficult, and the only reason I have called it a neurogenous tumor is because of the reticulin pattern, the presence of von Recklinghausen's disease, and the area which to me suggested a neurofibroma.

The sections show an obviously malignant tumor which is infiltrating the surrounding tissue and which is highly cellular. This lesion is made up of spindle-shaped cells which in some areas are well differentiated with rather abundant cytoplasm. In other areas the lesion is quite cellular and appears highly malignant. There are some zones which suggest that this lesion arose from a pre-existing neurofibroma. The reticulin stain shows rather prominent reticulin extending in rather long wiry lines between tumor cells but not wrapping around individual ones as you might expect in a fibrosarcoma.

This patient had von Recklinghausen's disease. Malignant degeneration of a neurofibroma can occur in this entity. Such malignant change only rarely occurs in the superficial nodules but does occur in the deeply placed lesions. We were particularly struck in our review of patients with neurogenous tumors of the thorax to find that in the malignant schwannomas 3 of the 5 had florid von Recklinghausen's disease. These 3 cases made up only a small percentage of our total group of neurogenous tumors.[2] Retroperitoneal neurogenous tumors are rare. The most common malignant primary tumor of the retroperitoneal area is a liposarcoma and the second most common is a leiomyosarcoma. Malignant schwannomas arising from pre-existing neurofibromas first undergo subtle histologic aberrations. We are particularly suspicious of such lesions when the nuclei begin to become more numerous. The nuclei may show few mitotic figures. If such changes occur, it is imperative that adequate local excision be done. The malignant schwannoma tends to recur stubbornly before distantly metastasizing. In the retroperitoneal

area cure of one of these lesions, if at all extensive, is impossible because of the difficulty in doing an adequate resection. I would, therefore, predict that this lesion would recur locally and cause the death of the patient.

CASE 13

Diagnosis.—Von Recklinghausen's disease, neurofibroma with melanin pigment, possibly malignant schwannoma.

Contributor.—Col. C. J. Lind, MC, Brooke Army Hospital, Fort Sam Houston.

History.—This 25 year old white man, active duty personnel, was admitted to the hospital February 11, 1952, for treatment of tumor of the left side of the face and neck. The patient stated that he first noted a mass on the angle of the left side of the jaw approximately seven years prior to admission. He stated that this was neither painful nor tender, and he denied any associated symptoms with the exception of the presence of a much greater growth of hair on the left cheek compared to the right. The patient admitted that beginning about two and one-half years before he noted slow increase in the size of the mass, which approximately one year before began to enlarge more rapidly. The patient stated that he had a similar smaller mass about 5 by 5 cm. removed from the posterior part of the scalp in 1945, but he was not aware of the diagnosis of this mass. Past history was not remarkable.

Physical examination: Vital signs were normal. Examination of the neck revealed diffuse enlargement of the soft tissue over the left side of the jaw and neck. This mass was firm, fixed, and adherent to the surrounding normal structure, and it had a bluish black discoloration with marked increase in the hair over the mass on the left. There was also noted a large area of irregular, spotty hyperpigmentation over the left side of the neck and shoulder region. There was a bluish discoloration of the buccal mucosa over the mass of the left cheek. There was also present a 4 inch, well-healed surgical scar over the left side of the occipital parietal region. Physical examination was otherwise normal.

Laboratory work: Laboratory results were within normal limits except for a roentgenogram of the skull and mandible which revealed the presence of a large, soft tissue tumor mass on the left lateral aspect of the face. There was gross irregularity of the inferior aspect of the left side of the mandible and zygomatic arch, both showing bony atrophy. The type of defect was described as that found secondary to pressure with nothing to indicate primary bone involvement. A roentgenogram of the skull revealed a large, bony defect in the left side of the inferior parietal region, the edges of which had the appearance of old surgical interference. The mastoid bone on the left also showed the effect of surgery.

Course in hospital: The patient was taken to the operating room on February 13, 1952, with a presumptive diagnosis of hemangioma of the left side of the face and neck. The left external carotid artery was ligated. The patient's postoperative course was uneventful. He was observed to be able to move all extremities and talk and respond intelligently to questioning until approximately twelve hours postoperatively, when it was noticed that the patient developed hiccoughs and was unable, apparently, to open and close his right hand. The patient developed a flaccid paralysis of the right upper and lower extremities with diminution of the reflexes on the right but with the absence of any pathologic reflexes. From this point on, the patient ran a gradual downhill course with changing neurologic signs. Despite symptomatic treatment, the patient remained in shock and died the second postoperative day.

Submitted diagnoses.—Neurofibroma, 10; hemangioma, 8; hemangioendothelioma, 6; Kaposi's sarcoma, 5; neurofibrosarcoma, 4; nevus (blue, pigmented, and so forth), 3; hemangiopericytoma, 2; melanoma, 1; liposarcoma, 1.

Dr. Ackerman: This would be an unusual situation for Kaposi's disease, which usually forms in the skin nodules which are usually composed of vascular elements with a sarcomatous background. A blue nevus, as we usually think of blue nevi, is a lesion which occurs in the skin, is relatively small, and is associated with melanin pigment and some schwannian proliferation. The tumor had melanin pigment in it so I suspect that is the reason for this diagnosis. Neurofibromas may have melanin pigment within them.

This tumor microscopically suggests a neurofibroma. It shows apparent Wagner-Meissner corpuscles and a prominent pigment which is positive with the Fontana stain indicating it is melanin. Some of the areas are quite cellular and are growing between muscle bundles. This increased cellularity with invasion would make one worry about the possibility that this was a malignant schwannoma. Such tumors, of course, may show little change early in their evolution except in their cellularity. Mitotic figures are few and far between. The melanin pigment does not indicate that this is a malignant melanoma. I have seen melanin pigment before in neurofibromas and such melanin pigment has been illustrated in a neurofibroma in Dr. A. P. Stout's fascicle on *Tumors of the Peripheral Nervous System.*[38] It is not too unusual in my experience to see malignant melanoma and neurofibroma associated. This patient also had excessive growth of hair, which goes along with von Recklinghausen's disease.

So I will say that case 12 was a case of von Recklinghausen's disease with malignant schwannoma. Case 13 was of a patient with von Recklinghausen's disease with possibly malignant schwannoma. I would be suspicious of this lesion because it has locally infiltrated and because it shows increased cellularity. The melanin pigment does not mean anything to me from the standpoint of deciding whether it is benign or malignant. It has become impressed on me rather forcibly during the past four or five years that when some of these soft tissue neurofibromas occur in particular locations, they have a decided chance of being malignant and their microscopic evidence of malignant change may be subtle. These lesions occur around the face; I have seen 2 of them already in the region of the eye, particularly the lower part of the eyelid in which over quite a long period of

time there was local invasion and destruction of the orbit, and death from meningitis followed. In another instance in the soft tissues of the axilla I saw a large malignant schwannoma which recurred once and was cured by shoulder girdle amputation. So, I think in the deep-seated neurofibromas we must be careful in the estimation of their malignancy, and the only hint that a tumor is malignant is that (1) it may be locally invasive, (2) it may be deeply situated, or (3) it may show increased nuclear cellularity without evidence of mitotic activity.

Audience member: What are the effects of roentgen ray?

Dr. Ackerman: I do not believe that roentgen-ray therapy will be of any value in any of the soft tissue sarcomas with the exception of liposarcoma. In the malignant neurogenous tumors irradiation will have no effect, any more than it will have as a rule in the malignant melanomas. So, in a case of this sort, the patient's only chance is adequate surgery.

Audience member: In this first case, as they knew it was inadequately excised, the physicians went back and gave the patient irradiation. Then some months later they went back in again and found simply a thin-walled cyst in which there was no evidence of the same tumor which was seen primarily, but only the thin wall of the fibrous connective tissue. The patient is now asymptomatic.

Dr. Ackerman: What is the total length of time from the first operation to date?

Audience member: Approximately a year.

Col. C. J. Farinacci, Denver, Colo.: Are plexiform neurofibromas believed to become malignant?

Dr. Ackerman: Plexiform neurofibromas represent gigantism of nerves which may involve a segment of a nerve trunk and this process may in time gradually extend over a long distance. In one of our cases the surgeon finally had to resort to amputation to cure the lesion.

Dr. J. J. Andujar, Fort Worth: What is the relationship of these to so-called neuronevus?

Dr. Ackerman: Neuronevus is a term that some pathologists use when they talk about nevi with prominent nerve structures such as Wagner-Meissner bodies in them. All nevi are essentially neuronevi. Both neurofibromas and nevi may have melanin pigment and both are neurogenous in origin. Malignant melanomas and neurofibromas may occur together.

CASE 14

Diagnosis.—Rectum, adenocarcinoma (well differentiated).

Contributor.—Dr. Lauren V. Ackerman, Washington University School of Medicine, St. Louis.

History.—This 68 year old white woman entered the hospital with a history of pain in the rectum of three months' duration. Tenesmus, frequent stools and mucus had been present for eight months. There had been no bloody or tarry stools. Weight loss was equivocal. On rectal examination a mass could be felt at the anorectal junction.

Submitted diagnoses.—Adenocarcinoma, rectum, 33; polyp, malignant, 3; polyp, adenoma, 6; carcinoma in situ, 1.

Dr. Ackerman: Sections demonstrate fairly well differentiated glands. These glands show loss of nuclear polarity, interglandular budding, and stratification of cells. There is no evidence of real invasion. These changes to me have gone far enough to be called carcinoma in situ and I would suspect that invasive cancer was present. Abdominoperineal resection was recommended and done. Examination of the specimen showed a circumferential tumor which had extended through all layers of the bowel. However, no lymph nodes were involved.

Dr. J. I. Mossberger, Denver: Will you say something about carcinoid tumors of the rectum?

Dr. Ackerman: I believe that all carcinoid tumors are potentially malignant tumors no matter what their location, and what they do clinically is somewhat dependent upon the time of their recognition and their location. In some areas such as in the appendix a carcinoid tumor may be recognized early because of symptoms of appendicitis, or conversely if the tumor is situated in the cecum, it may have an opportunity to grow to a large size before it is recognized; therefore, when first found, a carcinoid tumor may have grown locally all the way through the bowel and may have metastases regionally or distally. The same thing applies in the rectum. I have found on routine rectal examination several instances of incidental carcinoids in which the lesion has been submucosal and measured a centimeter or so, and in those cases thus far I have gotten into no trouble by advising local excision. However, if a carcinoid was found in a rectum and was invasive of any size or depth, I think the operation of choice would be an abdominal perineal resection. I think carcinoids in any location have the capacity to metastasize, and I would not personally divide carcinoids into benign and malignant categories.

Dr. Richard McDonald, La Marque: Can carcinoid tumors be mucin producing? Do they ever show a signet ring appearance?

Dr. Ackerman: Carcinoid tumors in my experience are not mucin producing nor do they ever show a signet ring appearance. There is a case reported by Dr. Robert Horn in the journal *Cancer* in which in one instance the patient had a carcinoid which Dr. Horn thought was mucin producing. But that was such a rare case that I do not believe I would lean on it as evidence that those tumors are mucin

producing. I think if you see a tumor of the rectum that is producing mucin and that has signet ring cells, it is probably an undifferentiated, highly malignant carcinoma.

Col. C. J. Farinacci, Denver, Colo.: Will you please restate what is meant by invasion of the base of a polyp by carcinoma in the case of sessile polyps and pedunculated polyps?

Dr. Ackerman: We are speaking now of epithelial tumors and just when a pedunculated polyp becomes a sessile polyp I am not able to say. If you have a well defined stalk, then if you have tumor extending down that stalk right near the point of excision, that would be a possible indication to do something radical. But if there is no tumor at the point where the surgeon cuts across the stalk and there is a clear area free from tumor, with tumor perhaps in the tip of the polyp, I think that probably you will get into no trouble by doing nothing further. And as I have stated on several occasions, I have never been able to get hold of an example of a patient with a cancer in the tip of the polyp in which the stalk was free and in which there was metastasis. I would like to know whether anyone here has ever had a polyp with cancer in the tip, with stalk free from cancer, and metastases within the regional nodes. I think it could occur, but I think it must be extremely rare. None. Well, I am still looking.

Dr. W. R. Mathews, Shreveport: Have you seen gland formation in carcinoid of the rectum?

Dr. Ackerman: I think that carcinoid tumors of the large bowel often have a pattern of festoons and ribbons as others have described them, but I have not seen true acini. I see what I interpret as false acini.

Dr. Mathews: Have you seen metastasis from a carcinoid of any location in the gastrointestinal tract that was limited to the submucosal zone?

Dr. Ackerman: I do not recall any such case.

CASE 15

Diagnosis.—Adrenal, malignant tumor of the sympathetic nervous system.

Contributor.—Dr. D. A. Todd, The Nix Hospital Laboratories, San Antonio.

History.—The patient was an adult man with symptoms of nervousness present for twelve years. Glycosuria was discovered two years before. Blood sugar was 319 mg. per 100 cc. This responded to diabetic regimen. Blood pressure varied between 110/80 and 140/90. Pain in the right upper quadrant and shock necessitated surgery, at which time a retroperitoneal tumor above the right kidney was seen and removed. Blood pressure and blood sugar postoperatively were normal.

Submitted diagnoses.—Pheochromocytoma, 17; carcinoma, adrenal cortex, 15; adenoma, adrenal cortex, 6; ganglioneuroma, 2; metastatic carcinoma (testes), 1.

Dr. Ackerman: We have adrenal cortex 21, medulla 17, and metastatic carcinoma from the testes. Anything is possible in this world today.

Sections show a tumor with considerable variation in its microscopic pattern. It is highly vascular, and often cells are arranged in ball-like masses separated by small blood vessels. This pattern suggests a pheochromocytoma, or a carotid-body tumor. Individual cells of pheochromocytoma often have large, bizarre nuclei. In the examination of numerous sections collections of ganglion cells and collections of ganglion cells associated with tumor cells are observed. The special stains serve to bring out the vascular pattern, the presence of hemosiderin pigment, and possibly melanin pigment. This lesion represents a tumor of the adrenal, and the differentiation has to be made as to whether it comes from the cortex or the medulla. Examination shows that grossly the tumor was highly hemorrhagic and quite friable. This gross finding is in favor of a tumor arising from the sympathetic system. The cortical adrenal tumors are often rather firm and yellow and may show zones of necrosis. In a cortical adrenal tumor cytoplasmic fat may be present, but the fat stain was negative in this case. Individual cells most closely resemble cortical cells or cells of the fetal adrenal cortex. The microscopic pattern is not always diagnostic in the differential diagnosis between a medullary and a cortical neoplasm.[18] In the pheochromocytoma all the cases that I have observed have been functioning and the patients have shown persistent or intermittent hypertension. This patient's highest blood pressure was 140/90. The glycosuria, with its disappearance after operation, could suggest function.

All things considered, I believe this is a tumor arising from the medulla and that it is malignant. As Wahl[42] pointed out, these tumors vary in their degree of differentiation all the way from a neuroblastoma to a ganglioneuroma. Between these two extremes there are often mixtures. This case suggests this type of pattern because of the collections of adult ganglion cells as well as immature elements. In one of Wahl's cases he described pheochromatous elements in association with well defined elements of the sympathetic nervous system. It is also true that a patient may have more than 1 tumor of the sympathetic nervous system in different locations and in various degrees of differentiation. Dr. Todd, do you have any follow-up on this patient?

Dr. Todd: He is well and going fishing every day during fishing season; his blood sugar has returned to normal; he is looking fine, but I think he is going to get into trouble, as you do.

Dr. Ackerman: What is the time interval between operation and now?

Dr. Todd: It has been about ten or twelve months.

CASE 16

Diagnosis.—Soft tissue, leg; reticulum-cell sarcoma.

Contributor.—Col. C. J. Lind, MC, Brooke Army Hospital, Fort Sam Houston.

History.—This 17 year old girl had a mass present on the left lower leg for twenty-four days with some associated pain. The lesion was firm, questionably fluctuant, tender, and a little warmer than the surrounding skin. The mass was approximately 3 by 2.5 inches in size and somewhat elevated but the borders were poorly defined. Apparently the lesion appeared suddenly. The lesion was locally excised on September 24, 1951. Roentgenograms of the bone were negative. On October 25, the leg was amputated just above the knee.

Submitted diagnoses.—Ewing's sarcoma, 10; lymphosarcoma, 7; sarcoma (lipo-, rhabdo-, round cell, neurogenic), 7; neuroblastoma, 4; synovial sarcoma, 4; melanoma, 3; hemangiopericytoma, 1; dysgerminoma, 1.

Dr. Ackerman: The tumor is highly cellular, made up of cells with rather large nuclei and inconspicuous cytoplasm. Nucleoli are fine. Mitotic figures are normal and abnormal, and abundant. This tumor is infiltrating between muscle bundles and apparently growing in the soft tissue rather than from the periosteum or bone. Special stains are of no help. They show reticulin around the blood vessels with little between individual cells. The Masson trichrome stains differentiate the muscle and the connective tissue. Fat stain is negative. I would feel that this is a fibrosarcoma on the basis of the character of the individual cells, for they do not have a spindle pattern and their reticulin pattern is against this. If it were liposarcoma, it would have much greater variation in the size and shape of cells, and there is no evidence of cytoplasmic fat. Neither does this have the appearance of any of the rhabdomyosarcomas. It is the right location for a synovial sarcoma. However, it does not have the glandular-like nor fibrosarcoma pattern of the synovial sarcoma. I am left with the diagnosis of lymphoma of reticulum cell type. I can see nothing against that diagnosis. The location, the age of the patient, and the microscopic appearance are all compatible. It would be of interest to know of the radiosensitivity of this lesion. Such lesions have previously been reported. I think that if the bones are negative, we would have to rule out Ewing's sarcoma, and I have discussed the differential diagnosis of the different types of sarcoma, and somebody has already asked me how about sympathicoblastoma, which I will discuss later. Hemangiopericytoma—no, this does not have the vascular or reticulum pattern which I think is very important. Dysgerminoma I think is a good diagnosis but again I have given the reasons why I do not think it is that tumor.

Dr. P. T. Flynn, Austin: The follow-up clinical history in this case is important:

Roentgen-ray report of the left femur a few hours prior to surgery on March 26, 1952, showed roentgen-ray evidence of a bone tumor in the distal end of the left femur which radiographically appeared as a giant-cell tumor. The deposits of tumor cells in the soft tissues of the posterior part of the thigh suggested that this was a malignant change. The change in the upper left tibia was probably subsequent to the surgical interference. There was a cystic lesion in the left humerus which appeared new. It is unlikely that any metastatic deposit could have gone to this particular location. The lesion appeared to be cystic and may have been an area of fibrous dysplasia.

Roentgenograms of both forearms showed no abnormalities. The right humerus and the hands were normal. Lateral studies of the skull showed no bony abnormalities. Roentgenograms of the chest showed no definite evidence of any bony abnormalities. There was a questionable area in the anterior end of the seventh rib which might have been due to overlapping vascular markings.

The film of the abdomen showed both normal lumbar spine and normal kidney shadows without evidence of calcification. The pelvis appeared normal without any bony abnormalities. Right tibia, femur, and fibula showed no bony changes. Roentgen-ray study of the left humerus showed a circumscribed cystic lesion in the midshaft of the humerus with definite endosteal erosion on the anterior medial aspect of the shaft. The cyst was fairly sharply demarcated but did not have any sclerotic borders. There was no evidence of any periosteal change about the abnormality. In reviewing the old films on this patient, I was fortunate enough to have the film of the left humerus on a chest study and this lesion was not present at that time.

Roentgen-ray study of the left femur and the left leg showed the previously described operative site to be largely filled in with new bone. The trabecular pattern of the distal end of the femur was somewhat coarser and there may have been some destructive process in the distal femoral end. There had been a fusion between the distal femur and the tibia. Numerous cystlike structures were seen in the shaft of the upper two-thirds of the tibia and these most likely represented changes subsequent to the operative interference. The knee apparently was well fused. There could be seen several soft tissue densities in the posterior aspect of the leg and thigh. These contained irregular strandlike areas of calcification which looked similar to the original tumor noted on the film taken as far back as 1948.

On May 6, 1952, this patient received external irradiation to her left femur and upper tibia through four external ports. She received a tumor dose of approximately 3,840 r in the midportion of the shaft of the femur in fifteen days. The skin dose was in the vicinity of 2,050 r and some erythema in the areas of overlap was expected. The patient tolerated her therapy well.

On May 11, the patient was brought to the emergency room following an automobile accident and roentgen rays revealed a fracture through the ankylosed left knee. The patient was placed in a single long leg hip spica cast. Roentgenograms of the left knee showed a fracture through the previously fused knee joint with the fracture likewise visible laterally and anteriorly. There was no appreciable displacement. The previously described changes in the bone were again noted without any progression or regression in the density since the previous study. The patient was dis-

charged from the hospital June 4. Because the leg failed to heal properly and because of the nonunion and instability of the joint, the patient remained in a hip spica.

On October 22, the blood phosphorus was 2.6 mg. per 100 cc., calcium 12.3 mg. per 100 cc., and alkaline phosphatase 1.7 Bodansky units. On October 23, a roentgenogram of the left humerus revealed no appreciable increase in the size of the cystic lesion; however, there appeared to be more thinning of the cortex on the medial aspect. Roentgenograms of the lower end of the left femur and the upper end of the left tibia revealed no essential change in the cystic lesion in the upper end of the tibia; however, since there was a complication of irradiation therapy to the tumor site plus the additional healing wound of the fracture through the ankylosed joint, it was difficult to interpret the radiographic changes.

Dr. Ackerman: This patient recently died and I looked at the gross specimens. There was tumor in both adrenals and in the lung. Careful examination of the lung showed that the bronchi were free and that the tumor was highly cellular and soft and that it was within the regional lymph node and within the lung but not within the bronchi.

The tumor also was heavily infiltrating the ovary, so the question is whether this patient could have had a primary malignant tumor of the ovary. I do not believe this could be a dysgerminoma of the ovary. It does not have the pattern, but could it be a primary reticulum-cell sarcoma of the ovary? I have seen such lesions on one or two occasions. I know that unfortunately when this patient first came in with a tumor of the soft tissues around the ankle, no pelvic examination was done. And when the patient came in and had advanced disease, a pelvic examination was done and the tumor in the region of the ovary was found. So that information does not help us. I think it would be asking quite a little to have a primary reticulum-cell sarcoma of the ovary have as its first clinical manifestation a soft tissue lesion in the region of the ankle. So, I will stand by my first diagnosis that this is a primary reticulum-cell sarcoma of the soft tissues of the leg with widespread dissemination. It would have been interesting to see what the response of this lesion would have been to roentgen-ray therapy. I would assume that some response would have occurred, but naturally this would not have been of enough value to have helped the patient in the face of such widespread dissemination. I know these sections were sent to Dr. A. P. Stout and it is comforting to me that he made the same diagnosis on this as I did. Are there any questions?

Dr. C. F. Pelphrey, Austin: Have you seen sympathicoblastoma in children regress spontaneously? If so, would you not still give a poor prognosis?

Dr. Ackerman: This is a question that has been brought up on many occasions and it is based on a famous case reported by Gross and Wohlbach. A patient had a tumor in the abdomen which was subjected to biopsy twice and supposedly underwent maturation from relatively undifferentiated to ganglioneuroma. Possibly that occurred, but in the original article there are no photomicrographs; there are only some line drawings. Now, in the review of my patients with tumors of the sympathetic nervous system, the only evidence I have of such an occurrence is that in one case a surgeon removed half of a tumor which was intermediate in differentiation and then later on the rest of it completely disappeared. Also, I have one case in which the patient had a neuroblastoma with liver and bone metastases with radiographic evidence of those lesions with microscopic evidence of liver metastasis in which the patient received roentgen-ray therapy to the liver, and a primary tumor and the bone lesions regressed spontaneously. As you may know, the amount of irradiation necessary to sterilize a neuroblastoma may be relatively little. So, I think it would be possible for a sympathicoblastoma in childhood to regress spontaneously. Has anyone here seen spontaneous regression?

Audience member: I know of an 18 month old girl who received only a biopsy when she was born. The father was a physician and decided against therapy and the thing just disappeared. Then the father went back to Boston, and roentgen-ray therapy was given anyhow.

Dr. Ackerman: That spoiled the experiment. I think it would be possible, as I have said in citing those other cases.

I know of another case in which a patient had a Wilms' tumor and had it removed, and then the patient received large amounts of irradiation which also hit the other kidney and hypertension occurred because of the irradiation of the other kidney. But I would say that if the patient had a neuroblastoma, it would be a real indication for irradiation therapy in view of the fact that Farber now has 6 patients, as you know, with proved liver metastases that are well after irradiation therapy. In that regard I would like to mention parenthetically that I had always thought that if a tumor of the sympathetic nervous system within the mediastinum is well differentiated, it should be removed, but if it is poorly differentiated and cannot be removed, a biopsy should be done and the patient subjected to very thorough irradiation therapy. It will be possible to cure the undifferentiated tumors of the sympathetic system in the same way that it is possible to cure one of the lesions below the diaphragm. I now have this patient with mediastinal tumors that have not gone long enough, but apparently the patient has a good chance of being cured. So that if a diagnosis of neuroblastoma is

made, the prognosis is not necessarily a poor one.

Dr. P. A. B. Cunningham, Galveston: Why do you exclude a highly anaplastic "round-cell" carcinoma of the bronchus as being the primary tumor?

Dr. Ackerman: That is a very good question. I would say that I cannot exclude anything, but all I can do is gather up the things I think are important. I think as pathologists we must realize that pathology is a very inaccurate science based on very tenuous things, and often diagnoses are made according to how forceful a pathologist may be who makes that diagnosis. So, if I seem a little dogmatic, I really hope you will excuse me because I really am not certain of many of these cases. In this particular case I know of no way of excluding, say, a small-cell carcinoma of the bronchus except the sequence of the clinical events, the picture of the tumor in the soft tissue or the thigh, and the fact that none of the tumor as it is growing in any of the sections which I have seen has shown clusters of cells separated by a stromal background. Now I have had a very difficult if not impossible time separating a small-cell carcinoma of the bronchus from a lymphosarcoma when, say, a 40 year old patient that somebody sends me has a large mediastinal mass and a supraclavicular lymph node. The reticulin stain will be of no value and perhaps the microscopic slide will be of no value. And in such cases where I am in doubt, I always advise that the patient receive irradiation therapy. However, I would say in practically all instances that when that patient comes to autopsy, you can decide with certainty whether he had a carcinoma or not by the pattern of its growth in one tissue or another and particularly by picking up tumor cells growing separated by a fibrous stroma in the same way you would do it with a carcinoma of the breast growing within an axillary lymph node. Now, 17 year old white girls do not often get carcinoma of the lungs either. I make the diagnosis on probabilities rather than on certainties.

If there are no further questions, I have enjoyed this brief interlude with you. I think these have been excellent cases with excellent questions.

Dr. A. O. Severance, San Antonio: Thank you. I am sure you can judge by the reaction of the audience how much we have appreciated your efforts and the quality of the work that has been put forth. I am also sure that we can say with certainty that this seminar has lived up to the reputation of those in the past. We would like to invite everybody here to come again in 1953 in the fall and we will have another seminar. Again let me say on the behalf of the local group of pathologists, Dr. Ackerman, we appreciate very much your coming and we would like you to come again. (Applause.)

CASE REPORTS

NONPARASITIC CYST OF THE LIVER

JOHN C. LONG, JR., M. D., Plainview, Texas

NONPARASITIC cysts of the liver are seldom diagnosed preoperatively. The lesion is found when the preoperative diagnosis is some such common condition as acute appendicitis[14] or ovarian cyst.[3] Every surgeon, therefore, must be prepared to treat the lesion whenever the abdomen is entered.

Of the approximately 500 cases reported since the condition was first noted by Bristowe[2] a century ago, only about one-half were recognized before the death of the patient, and exceptionally few of these were recognized prior to operation. Eliason and Smith,[5] in figures compiled from the Philadelphia General Hospital in 1944, found only 2 cases diagnosed during life. Caravati[4] in 1950 found only 1 case of a large solitary cyst of the liver diagnosed preoperatively in 200 cases reported.

A search of the literature further reveals that too little case material has been studied to yield much help in the treatment of nonparasitic cysts. However, it is clear that excision, when possible, is the treatment of choice. Unfortunately in most instances marsupialization appears necessary. One is left the choice of external marsupialization or internal cystenterostomy. The latter method, achieved by suturing the opened cyst to the stomach or to the proximal jejunum, has been tried in 1 case,[10] apparently with success.

The difficulties encountered when cystenterostomy is used in the treatment of a true pancreatic cyst are loculations and incomplete obliteration of the cyst cavity with recurrence of the abdominal mass. The majority of pancreatic cysts are pseudocysts, and these seem best treated by cystenterostomy, if excision cannot be carried out. True pancreatic cysts are rare. Nonparasitic liver cysts are comparable to true cysts of the pancreas. The thorough healing and closure of such cysts which can be insured by marsupialization makes this method of treatment preferable, I believe, particularly when the course of healing can be materially shortened by some such method as instilling Zenker's solution.

External marsupialization has as its main objection the long time necessary for permanent closure and healing. The available data, although vague as to the time necessary, leaves no doubt that it is considerable. The operative mortality in the reported cases varies between 10 and 30 per cent. Montgomery[11] was stimulated to try to shorten the morbidity imposed by external marsupialization. His method, used in the case to be reported, was so encouraging as to merit further trial.

Consideration of the various possible causes discussed by Bland-Sutton,[1] Moschowitz,[12] Kaufmann,[9] and Ewing[6] leads to the conclusion that liver cysts are congenital. Of the various classifications, that of Sonntag[15] is probably the simplest and most generally used. It differentiates (1) blood cysts and degenerated cysts, (2) dermoid cysts, (3) lymphatic cysts, (4) endothelial cysts, (5) cysts due to obstruction of bile ducts, and (6) proliferative cysts. Liver cysts appear to be about four times commoner in women than in men, and there seems to be a predilection for the white race. The average age incidence is about 40 years, although cases have been

reported of patients from 6 months to 80 years of age. The cysts may occur anywhere in the liver but are commonest in the right lobe. They may be either single or multiple and either unilocular or multilocular. The cyst walls are usually smooth and consist of epithelial cells, either flat, cuboidal, or columnar.

Nonparasitic cysts of the liver rarely produce symptoms until they become so large that they exert pressure. Even then symptoms may be vague and obscure because the cysts tend to enlarge gradually. In children the only sign in most cases is the presence of an abdominal mass.[11] Other manifestations include pain in the upper part of the abdomen, nausea, vomiting, a bloated sense of distention, occasionally diarrhea, and rarely jaundice. Tenderness may or may not be present. Carcinoma developing in congenital cysts is rare. The cyst fluid is usually thin and colorless or straw colored, although viscid fluid containing a large amount of true mucin has been found. The largest amount of fluid content reported was 17,000 cc. Analysis of the fluid has been carried out by Burch and Jones.[3]

The case to be reported may be regarded as typical.

CASE REPORT

Mrs. E. W., a 55 year old white woman who was a department store clerk, applied to the gynecology service because of vaginal discharge and irritation. Routine physical examination revealed the presence of a mass, 10 cc. in diameter, in the right upper quadrant of the abdomen just below the costal margin. Specific questioning then revealed that the patient had been aware of the mass for about two months. There was no pain, but the patient had had an aching discomfort in the back for several months. She thought the mass had been increasing in size. The patient was referred to the tumor service on January 20, 1953, with a presumptive diagnosis of a liver cyst.[16]

Physical examination was not remarkable except for the abdomen. The chief complaint of vaginal discharge was found to be due to Trichomonas vaginalis vaginitis. There was a well healed suprapubic midline abdominal incision from a uterine suspension done twenty-eight years previously. An umbilical hernia 4 cc. in diameter was present. In the right hypochondrium was the mass previously described. It was found to be firm but not hard, and moved with deep respiration.

Laboratory data included a 5,400,000 red blood cell count; a hemoglobin of 15.0 Gm.; and 7,850 white blood cells, with 58 per cent polymorphonuclear cells, 38 per cent lymphocytes, 3 per cent eosinophils, and 1 per cent basophils. The urine was negative, and the Kline test was negative. Survey roentgenograms revealed nothing diagnostic. The Echinococcus skin test was negative.

On January 29, operation was carried out through a Kocher incision under nitrous oxide, oxygen, and ether anesthesia. The tumor was found to be a cyst bulging from the right lobe of the liver and measuring 18 by 14 by 12 cm. The largest cyst mentioned in previous reports measured 19 by 18 by 16 cm.[3] The surface and the lining of the cyst were smooth and glistening, and the contained fluid was clear. A portion of the cyst presenting anteroinferiorly had a very thin wall for an area of 8 by 5 cm. The remainder of the cyst was deeply embedded in the substance of the right lobe of the liver. The gallbladder and biliary ducts, although displaced to the left, were free and clear.

The cyst was opened and the cyst fluid collected for laboratory examination. The thin 8 by 5 cm. area of cyst was excised, and marsupilization of the remainder to the central portion of the operative incision was carried out. The remainder of the incision was closed in layers, after the depths of the cyst were packed loosely with about 5 yards of folded fine mesh gauze. The umbilical hernia was repaired, and the patient was in good condition following the operation.

Sections of the cyst wall removed at operation showed it to be composed of what was apparently condensed compressed fibrous tissue and hepatic cords and cells with a mild chronic inflammatory response that was not specific. There was no evidence of hydatid cyst formation and the Echinococcus complement fixation test on the fluid was negative.

The patient's postoperative course was uneventful. The packing in the cyst was gradually removed during the first four postoperative days, and the patient was discharged from the hospital on her eighth postoperative day, to be followed in the clinic. Three weeks postoperatively a sufficient quantity of Zenker's solution to fill the cavity was injected, as suggested by Montgomery,[11] and this procedure was repeated twice weekly thereafter. The size of the cavity gradually decreased, and within twelve weeks after the operation the sinus closed. This represents a much more rapid closure than has been achieved in previously reported cases and lends support to Montgomery's idea of using Zenker's solution as a sclerosing agent in the obliteration of these cysts. The patient was followed for twelve months and remained without evidence of disease or tumor.

SUMMARY

The problem of how to treat a cyst of the liver is discussed.

It is believed that marsupialization remains the treatment of choice when excision cannot be carried out. The time required for permanent healing and closure is materially shortened by filling the cavity with Zenker's solution.

A case so treated is reported.

BOARD EXAMINATIONS

Texas State Board of Examiners in Basic Sciences, Austin, April 23-24, 1954. Mrs. Betty Ratcliff, 407 Perry-Brooks Bldg., Austin, Chief Clerk.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

International Surgeons Examinations

Qualifying examinations for fellowship in the International College of Surgeons will be held May 3-4. Written examinations will be given at Cook County Graduate School of Medicine, Chicago, on May 3; clinical examinations, at Cook County Hospital on May 4. Further details may be obtained from the International College of Surgeons, United States Chapter, 1516 Lake Shore Drive, Chicago 10.

SINGLETON SURGICAL SOCIETY

The first annual scientific program of the Singleton Surgical Society, organized by former residents of the Department of Surgery of the University of Texas Medical Branch to further surgery in the state and to advance the prestige of the department, was held January 23 and 24 in Galveston. Future meetings will be held alternately in Galveston and in some other outstanding university or clinic, the 1955 session being scheduled for Dallas in January.

Charter members of the organization are general surgery residents who trained under Dr. A. O. Singleton during the period from 1927 to 1947 when he was chairman of the department. Active and honorary members have been elected from graduates or members of the department.

Officers of the newly established group are Dr. J. Peyton Barnes, Houston, president; Dr. Norman Duren, Beaumont, vice-president; Dr. Walter B. King, Jr., Waco, secretary-treasurer; and Dr. Truman G. Blocker, Jr., Galveston, and Dr. John C. Kennedy, Houston, members of the council. In addition to these officers, charter members include Drs. W. H. Ainsworth, Galveston; Sam R. Barnes, Trinity; Gustavus A. Bynum, Hattiesburg; Isadore V. Epstein, Pasadena; Harold E. Griffin, Corpus Christi; J. W. Hillsman, Carlsbad, N. Mex.; Adolph Kauffman, III, Fort Worth; O. T. Kirksey, Jr., Galveston; Maynard D. Knight, San Angelo; Joseph P. McNeill, Dallas; J. C. Neel, Dallas; John Peek, Jacinto City; W. H. Pickett, Dallas; F. F. Rogers, Corpus Christi; Ed B. Rowe, Galveston; Robert H. Rowland, Sheppard Air Force Base; C. E. Thomas, Big Spring; George W. Tipton, Austin; Alfred M. Tocker, Wichita, Kan.; Jack L. Walker, Cameron; Sam Wallis, Lihue, Kauai, T. H.; Charles E. Webb, El Paso; Harriss Williams, Austin; and Fred J. Wolma, Galveston.

The scientific program by Galveston physicians included the following presentations:

Present Concepts of Surgical Treatment of Peptic Ulcer—Dr. R. M. Moore.
Surgery of Adrenal Gland—Dr. E. J. Poth.
Varicose Veins; Postphlebitic Syndrome—Drs. J. M. Thiel and Truman G. Blocker, Jr.
Healing of Fractures—Dr. W. H. Ainsworth.
Postoperative Atelectasis—Dr. A. W. Harrison.
Report of Current Research; Activities Relating to Severely Burned—Dr. Blocker.
Future Plans of the Department of Surgery Regarding Resident Training Program; Diagnostic Clinic Policies of New Hospital—Drs. Moore and Poth.
Portal Hypertension—Dr. Poth.

Wives of many of the surgeons were present and participated in a cocktail party, luncheon, and supper.

Texas Society of Pathologists

The Texas Society of Pathologists met January 31 at Galveston and adopted a new constitution and by-laws in compliance with the society's policy to revise completely that document every ten years. Dr. John J. Andujar, Fort Worth, became president; Dr. C. B. Sanders, Houston, president-elect; Dr. A. J. Gill, Dallas, vice-president; and Dr. Lloyd R. Hershberger, San Angelo, secretary-treasurer.

The forty-one members in attendance were presented with the following scientific program: "Paper Chromatography" by J. G. Bieri, Ph.D., associate professor of biochemistry at the University of Texas Medical Branch, Galveston; "Antibiotic Sensitivities" and "Bacterial Problems of Air Conditioning" by Frank B. Engley, Ph.D., associate professor of bacteriology; and following two motion picture films, a conducted tour of the Tissue Culture Laboratory by its director, C. M. Pomerat, Ph.D., professor of cytology.

PERSONALS

Dr. W. H. Bennett recently resigned his position as Marshall Health Officer after twenty years of service. Dr. Bennett gave his age and other practice as reasons for his resignation. *Dr. Roger Harmon* was named to take his place.

Dr. George Aagaard, dean of the Southwestern Medical School, Dallas, has been elected chairman of the American Medical Association's Committee on Medical Motion Pictures.

Governor Allan Shivers appointed two doctors to serve on the state's Advisory Hospital Council for terms ending July 17, 1959. They are *Dr. Raymond E. Sitta,* Chillicothe, hospital administrator member, and *Dr. John M. White, Jr.,* Port Arthur, physician member.

Dr. Stephen B. Tucker has been elected president of the Nacogdoches County Fair and Livestock Exposition.

A new member of the board of directors of the Citizens National Bank, Greenville, is *Dr. Frank J. Little.*

Dr. M. A. King was recently elected "Man-of-the-Year" by the Frankston Lions Club.

Dr. L. Louis Harrop, Harlingen, is the new president of the Gulf Coast Magic Club.

Dr. M. C. Overton, Jr., Pampa, was reelected president of the Top o' Texas Hereford Breeders Association recently.

A special award citation was given *Dr. W. W. Flowers,* Livingston, by the Polk County Chamber of Commerce for his work in the medical field and with veterans, the American Legion, and Boy Scouts.

Mrs. W. H. Barnett, wife of *Dr. W. H. Barnett,* Abilene, died at a local hospital in March after suffering a stroke.

Dr. and Mrs. Wiley Roosth, Tyler, and *Dr. Frances Pierce Lankford and Eugene Lankford,* Grand Prairie, are parents of girls, according to the *Alumni Bulletin,* The University of Texas Medical Branch, Galveston.

New parents of boys, according to the *Alumni Bulletin,* are *Dr. and Mrs. Cecil R. Glass,* Galveston, and *Dr. and Mrs. H. G. Tree,* Texas City.

Wichita Falls Boy Wins Essay Contest

Wichita Falls, El Paso, and El Campo high school students won first, second, and third places in the state essay contest on "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care." Sponsored nationally by the Association of American Physicians and Surgeons, the contest was held in Texas under the direction of the Woman's Auxiliary to the Texas Medical Association with the Association supplying cash prizes.

Milton Copeland, Wichita Falls; David Curry, El Paso; and Kate Wood, El Campo, won prizes of $250, $150, and $100, respectively, in the state contest, and their essays have been forwarded to compete in the national contest. Dr. Royall M. Calder, Owen J. Reamer, Ph. D., and Robert D. O'Callaghan, all of San Antonio, judged the entries in the state competition, for which Mrs. A. O. Severance, San Antonio, was chairman. Dr. Mal Rumph, Fort Worth, is chairman of the national contest committee for the Association of American Physicians and Surgeons, and Drs. Charles D. Reece and Hampton C. Robinson, Houston, are members of the committee.

In addition to the first three awards, the Texas Medical Association provided prizes for essays up to tenth place in the state contest and for each of the fifteen districts, altogether a total of $1,000. These additional prizes were won as follows:

State—fourth, $50, Gerald Richman, Henderson; fifth, $25, Tobye Fram, Baytown; sixth, $10, Carolyn Monaghan,

Waco; seventh, $10, Bernadette Borchers, Laredo; eighth, $10, Sheridan Mott, El Paso; ninth, $10, Helen Meurer, Fredericksburg; tenth, $10, Jackey Lumpkin, Houston.

Districts ($25 each)—1, David Curry, El Paso; 2, Nancy Conway, Big Spring; 3, Norma Friedman, Amarillo; 4, Gladys Ruth Coldewey, Winchell; 5, Helen Meurer, Fredericksburg; 6, Bernadette Borchers, Laredo; 7, Caroline Covington, Burnet; 8, Kate Wood, El Campo; 9, Tobye Fram, Baytown; 10, Billy M. Willis, Nacogdoches; 11, Gerald Richmond, Henderson; 12, Carolyn Monaghan, Waco; 13, Milton Copeland, Wichita Falls; 14, Ernest F. Couch, Dallas; 15, Clara Schell, Longview.

OBSTETRICIANS AND GYNECOLOGISTS MEET

The Texas Society of Obstetricians and Gynecologists held its twenty-fifth annual meeting February 19 and 20 in Waco, with Dr. Carl T. Javert, associate professor of obstetrics and gynecology at Cornell University Medical College, New York, as the society's guest.

New officers named were Dr. G. F. Goff, Dallas, president; Dr. John Delaney, Galveston, president-elect; Dr. Oran V. Prejean, Dallas, vice-president; and Dr. Carey Hiett, Fort Worth, secretary-treasurer.

The scientific program included discussions on pudendal block in obstetrics, pelvic lymphatics and gynecological disease, emotional component in trichomonas vaginalis, induction of labor, present trends in vaginal hysterectomy technique, use of extraperitoneal pelvic lymphadenectomy in female malignancy, transverse lower abdominal incision for pelvic tumors, modern trends in therapeutic abortion, pathology of spontaneous abortion, use of Demerol and scopolamine in labor and delivery, and poliomyelitis as a complication of pregnancy.

Speakers were Drs. J. R. Harris, Jr., Lubbock; S. Foster Moore, Jr., San Antonio; John W. Simpson, Col. (MC) AUS, Fort Sam Houston; Stanley Rogers, Houston; John Thomas Armstrong, Houston; Jack Moore, Houston; Felix Rutledge, Houston; John J. Delaney, Galveston; R. Vernon Colpitts, Houston; G. G. Passmore, San Antonio; E. W. Santa Cruz, San Antonio; Robert K. Gassler, Waco; and Dr. Javert. The resident award paper was given by Dr. Charles R. S. Mackenzie, resident in obstetrics and gynecology at John Sealy Hospital, Galveston.

Discussions were begun by Drs. O. Robert Hand, Lubbock; Walter Morse, Houston; Allen L. McMurrey, Houston; Howard O. Smith, Marlin; S. Foster Moore, San Antonio; Charles William Braselton, Jr., Fort Worth; Milton A. Davison, Marlin; and J. W. Jones, Texarkana.

Approximately 150 members and guests attended.

Cancer Symposium

The eighth annual Symposium on Fundamental Cancer Research was given by the University of Texas M. D. Anderson Hospital and Tumor Institute April 5-6 in Houston. In addition to the usual joint meeting with the South Central Region of the College of American Pathologists, the program included a joint session with the Tissue Culture Association on "Tissue Culture in Cancer Research."

Dr. Peyton Rous, emeritus member of the pathology and bacteriology department of the Rockefeller Institute for Medical Research in New York, received the Bertner Foundation award. Dr. Rous delivered the Bertner Lecture the night of April 5.

Out-of-state patticipants included Dr. George O. Gey, Dr. Frederik B. Bang, and Margaret K. Gey, Baltimore; Mary F. Orr and Dr. Barton McSwain, Nashville; Dr. Joseph Leighton, Bethesda, Md.; Margaret R. Murray, Ph. D., and Dr. Arthur P. Stout, New York; Dr. Austin Brues and Agnes N. Stroud, Lemont, Ill.; Dr. William C. Moloney, Boston; Dr. Leonard Hamilton, New York; Mary L. Petermann, Ph. D., New York; Dr. Edith L. Potter, Chicago; Dr. Frederick N. Silverman, Cincinnati; and Dr. Wylie D. Forbus, Durham, N. C.

Others on the program were Dr. Peter M. Marcuse, Houston; Dr. T. C. Hsu, Galveston; and F. Gonzales, Ph. D.; Jorge Awapara, Ph. D.; Bruno Jirgensons, Ph. D.; and Dr. Grant Taylor, from the M. D. Anderson Hospital. Dr. Taylor is also dean of the University of Texas Postgraduate School of Medicine.

The April 5 program was on "Tissue Culture in Cancer Research," and on April 6 there was a cancer pathology and radiology conference on "Tumors of Infancy and Childhood."

Audio-Digest Foundation

The Audio-Digest Foundation, established to further postgraduate medical education and a nonprofit corporation sponsored and owned by the California Medical Association, offers a new type of service to physicians. Tape recordings of abstracts of current medical literature, which can be played on any tape machine, are available from Audio-Digest for individual physicians, staff groups, or county medical societies. With proceeds going to the American Medical Education Foundation, Audio-Digest issues weekly a one-hour tape for general practitioners, on which is recorded from twenty to thirty abstracts of outstanding current medical information. A second service includes semimonthly digests in the fields of surgery, internal medicine, and obstetrics and gynecology. The new foundation also has available tape-recorded lectures and panel discussions on one-hour reels as a third service.

All articles are screened by a board of medical editors of which Dr. Edward C. Rosenow, Jr., Pasadena, Calif., is editor-in-chief. Headquarters for the Audio-Digest Foundation are at 800 North Glendale, Glendale, Calif.

Texas Club of Internists

The Texas Club of Internists met February 26-27 in Galveston, with seventy-seven members present. Dr. Joseph F. McVeigh, president, presided over the morning meeting February 26, with Dr. L. C. Carter presiding that afternoon. Dr. V. E. Schulze, president-elect, presided over the meeting February 27.

Dr. Lawrence G. May spoke on "Clinical Use of Radioactive Iodine"; Dr. Edward D. Futch, III, "Clinical Manifestations of Torulosis"; Dr. M. R. Hejtmancik and Dr. H. W. Palley, "Electrocardiogram in Congenital Heart Disease"; and Dr. Raymond Gregory, "Diagnosis and Treatment of Hyperadrenocortico States."

Afternoon speakers were Dr. James C. Wright, Jr., who spoke on "Cardiac Arrest and Resuscitation"; Dr. J. E. Johnson, "Blood Volume Studies Before and After Diuretics"; Dr. M. Ruth Baxter, "Effects of Newer Diuretics"; and Dr. Fred Mullins, "Cutaneous Manifestations of Xanthomatous Biliary Cirrhosis."

Dr. G. W. A. Currie welcomed the group to the John Sealy Hospital, where the February 27 meeting was held. "Pulmonary Emphysema-Physiology and Treatment" was the subject of Dr. John W. Middleton, Dr. A. M. Longfield, and Dr. David Miesch. Dr. Bernard R. Cooley spoke on "Angiocardiography and Aortography in Diagnosis of Coarctation of Aorta, Patent Ductus Arteriosus and Tetralogy of Fallot."

TEXAS UROLOGICAL SOCIETY

Eighty-two Texas urologists and forty-five wives were in Fort Worth February 21-22 for the meeting of the Texas Urological Society. The following scientific program was presented for the physicians:

Management of Lower Ureteral Calculi—Dr. Harold A. O'Brien, Dallas.

Cystectomy and Plastic Procedures in Exstrophy—Dr. Harry M. Spence, Dallas.

Testicular Biopsy: Its Indications and Interpretation—Dr. Warren O. Nelson, Iowa City, Iowa.

Experiences With Injection of Radioactive Gold for Carcinoma of Prostate Gland—Dr. Noble S. Malus and Dr. J. Reese Blundell, Houston.

Radioactive Cobalt in Treatment of Bladder Tumors—Dr. Vincent Vermooten, Dallas.

A pyelogram conference concluded the scientific program.

During the business meeting, the society elected Dr. S. J. R. Murchison, Fort Worth, president, and Dr. A. J. Ashmore, Corpus Christi, secretary. It was decided that the next meeting would be held in Corpus Christi, the date to be set later.

A cocktail party and dinner were held February 21. Luncheons were held February 22 for the society and for the ladies.

New Mexico Medical Society

Texas doctors have been invited to attend the seventy-second meeting of the New Mexico Medical Society May 13-15 in Santa Fe. The registration fee is $15.

Eight guest specialists will speak at the scientific meetings, which will begin at noon, May 13, and end at noon, June 15. Thirty technical exhibits, round-table luncheons, and the annual presidential dinner dance will be included in the three-day meeting. Additional information is available from Ralph R. Marshall, Executive Secretary, 223-224 First National Bank Building, Albuquerque, N. Mex.

TEXAS HOSPITAL ASSOCIATION

The twenty-fifth annual convention of the Texas Hospital Association will be held in Houston, May 18-20.

Out-of-state speakers include Dr. Frank R. Bradley, Saint Louis, president-elect of the American Hospital Association, and Dr. Edwin L. Crosby, Chicago, president of the American Hospital Association in 1952-1953. Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, will speak to the group on "National Trends in Medical and Hospital Care." Other Texas speakers include Dr. Everett C. Fox, Dallas, who will speak on "Who Should Pay for the Medical Care of Indigents?"; William L. McGill, Austin, civil defense coordinator for the Texas State Division of Defense and Disaster Relief; E. M. Collier, Abilene, who will report as chairman of the association's Committee on Shortage of Professional Personnel; and Philip R. Overton, Austin, who will speak on national legislation affecting hospitals.

The exhibit show and meetings will be held in the Shamrock Hotel.

TEXAS PROCTOLOGIC SOCIETY

An operative clinic was conducted at Memorial Hospital, Houston, at the February 27 meeting of the Texas Proctologic Society. A three-hour round table discussion of unusual cases was held by the members. Officers elected were Dr. Jack Kerr, Dallas, president and Dr. John McGivney, Galveston, secretary-treasurer.

NATIONAL HEALTH LEGISLATION

A large amount of national health legislation is well advanced, and if Congress holds to an average pace, several bills affecting the medical profession are likely to become law in the next month or so, the Washington staff of the American Medical Association reports. Here is the situation in brief:

Medical Deductions.—Legislation to increase the amount deducted from taxable income for medical expenses is a part of the omnibus tax revision bill which cleared the House by a wide margin but ran into some delay in the Senate. This bill, with the medical deduction liberalization intact, should reach the White House in plenty of time for enactment.

Hill-Burton Expansion.—A move to make important changes in the hospital construction bill developed in the Senate Labor and Welfare Committee after the House had passed its version with some amendments. The American Hospital Association proposed that the rather complicated House legislation be scrapped and instead that the Hill-Burton act be amended (a) to include rehabilitation centers and nursing homes and (b) to place a high priority on hospitals for the chronically ill. The AHA idea immediately attracted support. The new approach meant inevitable, but probably not fatal, delays.

Reinsurance.—The proposal to reinsure health policies, once hailed as the keystone of the Eisenhower administration's health program, continued to encounter opposition. At one stage, of all the national associations to testify on reinsurance only the American Hospital Association was giving it unqualified support. The American Medical Association, United States Chamber of Commerce, and national spokesmen for the insurance industry took about the same position: (1) Reinsurance alone cannot make uninsurable risks insurable. (2) The threat of federal control of medicine is inherent in any program that would bring the federal government in such close contact with medical practice.

Health Grants.—An administration plan would do away with the present categorical grants for identified projects, such as venereal disease control, and substitute funds earmarked for three general purposes, (a) to maintain present programs, (b) to initiate new programs or to expand existing ones, and (c) to finance public or private experimental or pilot programs of national or regional significance. In both committees the question was whether to group the first and second type grants together, with the state health authorities deciding how to divide up the federal money among old and new projects. Funds for the third type of grant—experimental—would be completely controlled by the surgeon general. One suggestion is to require approval of the state health officer for any experimental (type three) grant in his state. Another is to eliminate the third type of grants altogether, letting the National Institutes of Health handle public health as well as other medical research grants.

Social Security.—The American Medical Association, American Dental Association, and a number of other national groups are fighting vigorously to prevent compulsory extension of old age and survivors insurance to physicians, dentists, and most other self-employed. Instead, they want the privilege of deferring income tax payments on that part of earnings placed in restricted annuities—the Jenkins-Keogh plan. AMA also feels that there is no need for the bill's provision that pension rights be frozen during periods when the worker has been medically determined to be disabled. A better suggestion, the Association maintains, is to base pension rates on the ten best working years, thus vir-

tually eliminating the need for the controversial medical examinations. Prospects are good that social security will be extended, either with or without these changes.

Vocational Rehabilitation.—Generally, Senate witnesses favor the administration's proposal to expand the federal-state programs for vocational rehabilitation providing United States grants are not cut. However, with no House bill introduced as of this writing, there is some doubt that, even if the Senate clears the measure, the House can find time to deal with it.

Doctor Draft Amendment.—A bill growing out of the Peress case swept through the Senate without objection. It may be law by the time this is published. It would amend the doctor draft act to permit the services to keep on duty as an enlisted man, assigned to professional tasks, anyone called under the doctor draft act whose loyalty is questioned. The Defense Department has promised to investigate such cases immediately, so that the man can be cleared promptly and offered a commission or discharged. The discharge would state that action was taken on loyalty grounds.

LIBRARY SECTION

ATOMIC MEDICINE

The increasing number of articles in the medical literature dealing with atomic medicine indicates its great value in therapeutics as well as diagnosis. Continuing experiments and clinical experience in this field have helped scientists to understand many of the life processes and mechanisms which were only dimly recognized before.

"The Atom and Medicine," a film recently purchased by the Texas Medical Association Memorial Library, will be of assistance to the physician presenting a program to the lay public on the medical uses of atomic energy.

The following articles and films will be of interest:

Articles and Books

Badenoch, D. M., and Callender, Sheila T.: Iron Metabolism in Steatorrhea—Use of Radioactive Iron in Studies of Absorption and Utilization, Blood *9:*123-133 (Feb.) 1954.

Behrens, C. F.: Atomic Medicine, ed. 2, Baltimore, Williams and Wilkins, 1953.

Bettman, J. W., and Fellows, Victor: Radioactive Phosphorus as Diagnostic Aid in Ophthalmology, Arch. Ophth. *51:*171-179 (Feb.) 1954.

Conklin, Stanley D., and Knisely, Samuel W.: Radioactive Iodine in Thyroid Disease, Guthrie Clin. Bull. *23:* 144-148 (Oct.) 1953.

Dobyns, Brown M., and Brownell, Gordon: Directional Scintillation Counter for Laboratory Study of Thyroid Tumors, Lab. Invest. *3:*39-47 (Jan.) 1954.

Harris, Norman O.: Role of Radioactive Isotope in Bone Metabolism, Mil. Surgeon *114:*108-111 (Feb.) 1954.

Meschan, Isadore, and others: Dosage Tables for Cobalt 60 for Use with Interstitial, Plaque, and Intracavitary Applications, Am. J. Roentgenol. *71:*320-332 (Feb.) 1954.

National Industrial Conference Board: Atomic Energy in Industry, Special Conference, Oct. 16-17, 1952.

Owen, Charles A., Jr.: Laboratory Aids to Medical Practice—Radioactive Isotopes in Diagnosis and Treatment, Minnesota Med. *37:*138-139, 1954.

Taber, Kenneth W.: Scintiscanning Entire Body for Radioiodine, Mississippi Valley M. J. *75:*188-191 (Nov.) 1953.

Films

The Atom and Medicine, 16 mm., sound, 12 minutes.

MOTION PICTURES FOR LOAN

Oral Cancer: The Problem of Early Diagnosis

16 mm., sound, color, 32 minutes.

Clinical illustrations of early lesions of the tongue, floor of the mouth, gingiva, cheek, palate, and lip are presented, and the technique of biopsy and a method of thorough oral examination are shown. Emphasis is on the fact that only by routine, thorough examination of the oral cavity and the nodes of the neck is it possible to discover cancer of the oral cavity in an early stage.

This film is excellent for general practitioners and dentists. It will be of interest also to interns, residents, and medical students.

Conquering Darkness

16 mm., sound, 20 minutes.

Produced in cooperation with the New Jersey State Commission for the Blind, this film shows how blind persons can find their rightful place in the workaday world. It includes education, industrial placement, assistance, home industry, and prevention. The film is excellent for high school students, adult lay audiences, and nursing trainees.

The Role of Gastroscopy in the Diagnosis and Treatment of Gastric Pathology

16 mm., sound, color, 33 minutes.

Gastroscopy and its place in the diagnosis of gastric disease are presented in an informative manner. Following a brief historical introduction, the film shows the development of the modern flexible gastroscope. The indications and contraindications for gastroscopy are clearly defined and evaluated. By appropriate models, roentgenograms, and other illustrative materials, the film clearly depicts the lesions which may be differentiated by gastroscopy. The close cooperation between the gastroscopist and roentgenologist is stressed. Advantages and disadvantages of each procedure are clearly shown.

Athletic Type Injuries, Prevention and Immediate Care

16 mm., silent, color, 45 minutes.

This film is designed to give a more complete understanding of the problems of athletic types of injuries. Starting with the ankle, it shows preventive measures. It also shows methods for the immediate care of athletic injuries to the knee, tendons and muscles, groin and hip bone, rib and shoulder, elbow, wrist, and fingers.

This film will be of interest to general practitioners, medical students, and interns.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library of the following recent gifts:

Bexar County Medical Society Library, San Antonio, 63 reprints.

Dr. Wylie F. Creel, Austin, 103 journals.

Dr. Everett C. Fox, Dallas, 32 reprints.

Dr. Dan B. Hamill, Corsicana, 19 books.

Dr. George R. Herrmann, Galveston, assorted reprints.

Dr. Amedeo Magliolo, Dickinson, 38 journals.

Mr. J. Louis Neff, Texas Division, American Cancer Society, Austin, 1 journal and assorted reprints.

Dr. Henry Renfert, Austin, 29 journals.

Dr. N. L. Schiller, Austin, 16 journals, 3 reprints.

Mrs. G. F. Thornhill, Austin, 159 books.

Dr. Samuel P. Todaro, Austin, 29 books.

BOOK NOTICES

[1]Peptic Ulcer; Pain Patterns, Diagnosis and Medical Treatment

LUCIAN A. SMITH, M. D., M. S. in Med., F.A.C.P., *Assistant Professor of Medicine, Mayo Foundation, and Head of Section Division of Medicine, Mayo Clinic, Rochester, Minn., and* ANDREW B. RIVERS, M. D., M. S. in Med., F.A.C.P., *Late Associate Professor of Medicine, Mayo Foundation, and Consultant, Division of Medicine, Mayo Clinic. Foreword by George B. Eusterman. 576 pages. $12.50. New York, Appleton-Century-Crofts, Inc., 1953.*

This exceptionally complete book on peptic ulcer stresses an approach to peptic ulcer different from the usual. Pain produced by stomach and duodenal lesions in reference to skin sites is particularly detailed and exact. The section on roentgenologic diagnosis is excellent.

The section on treatment of peptic ulcer and its complications is excellent in all aspects.

This book is interesting, readable, and well illustrated and is recommended as a very complete work on peptic ulcer.

[1]*E. S. Rogers, M. D., Nacogdoches.*

Atomic Medicine

Edited by CHARLES F. BEHRENS, M. D., *Rear Admiral (MC) United States Navy; Staff Medical Officer, Eastern Sea Frontier. Formerly Director, Atomic Defense Division, Bureau of Medicine and Surgery, Navy Department; Commanding Officer, Naval Medical Research Institute, National Naval Medical Center, Bethesda, Md. Second edition. 632 pages. $11. Baltimore, Williams and Wilkins Company, 1953.*

The second edition is the work of twenty well known physicians and scientists who are authorities in their fields. The related subjects such as atomic disasters and method of survival are discussed.

The material presented in this new edition is fundamental; its application to medicine is well presented. For physicians seeking only the basic knowledge of the subject the book is exceptionally good.

The Conception of Disease

WALTHER RIESE, M. D. *120 pages. $3.75. New York, Philosophical Library, 1953.*

The various concepts of diseases have been analyzed and in many instances the concept has been traced back to its historical origin.

It is the purpose of this book to unfold and analyze a complete picture of disease, its history, its versions, and its nature. In the chapter on disease and art is found this interesting remark, "A mental disease may be the source of new experiences, representing the contents of disease. These new experiences may be a stimulus to the artist. . . . So far no case has come to my knowledge in which disease itself produced an artist. It is true that psychotic individuals frequently start drawing and painting for the first time during their disease." There is an excellent discussion on the social conception of disease. This is a very interesting and a well written book.

[2]Modern Treatment; A Guide for General Practice

By fifty-three authors, edited by AUSTIN SMITH, M. D., *Editor of The Journal of the American Medical Association, and* PAUL L. WERMER, M. D., *Secretary, Committee on Research, American Medical Association. First edition. 1146 pages. $20. New York, Paul B. Hoeber, 1953.*

In more than 1,000 pages Drs. Smith and Wermer and others, all specialists in their fields, have amassed all the known therapies for the ills of mankind. Their prescribed therapy is lucid, brief, and authoritative. Several different courses of treatment are given in which the therapy is not specific. The first chapter, "The Patient-Physician Relationship," should be read by everyone, as it covers a phase of medical education often heard but not read in text form.

I have found the book very helpful and hope that the authors will revise it within the next two years.

[3]Nervous Transmission

ICHIJI TASAKI, M. D., *Central Institute for the Deaf, St. Louis. 164 pages. $7.50. Springfield, Ill., Charles C Thomas, 1953.*

This monograph presents the author's concept of nervous transmission supported by well illustrated personal experimental data. The author is an experienced investigator in this field and this work should be of considerable value to other researchers. Included is the description of a technique for isolation of a single nerve fiber for study of electrical transmission. Photomicrographs display this technique nicely.

[2]*E. B. Groner, M. D., Corpus Christi.*
[3]*Thomas M. Runge, M. D., Austin.*

[4]**Ballistocardiography**

WILLIAM DOCK, M. D., F.A.C.P., *Professor of Medicine, State University Medical Center at New York City, College of Medicine; Visiting Physician, Kings County Hospital, Brooklyn;* HARRY MANDELBAUM, M. D., F.A.C.P., *Associate in Medicine, Jewish Hospital of Brooklyn; Physician in Charge, Hypertension and Nephritis Clinic at Jewish Hospital of Brooklyn; and* ROBERT A. MANDELBAUM, M. D., *Assistant in Medicine, Jewish Hospital of Brooklyn; Assistant in Cardiology, Beth-El Hospital, Brooklyn. 203 pages. $9.50. St. Louis, C. V. Mosby Company, 1953.*

This is doubtless the best book that has been prepared on ballistocardiography. The book is compact, the printing is excellent, the illustrations are well presented, and the text is as clear as it is reasonable to expect of a subject that is relatively new to the practitioner. Let it be clear that this is no book for general practitioners, nor is it at present a very useful book for specialists in heart disease. The usefulness of the book would be confined to those who are interested in ballistocardiography as a sort of research tool. It has not definitely been determined that this is an instrument of value in clinical medicine. The reviewer spent a day recently with Dr. Isaac Starr, the father of ballistocardiography, who still feels there is a future usefulness for the subject. He did not encourage the reviewer to buy a type of ballistocardiograph used by Dr. Dock and his coauthors because it is impossible to standardize the type of instruments used. Of course, the cumbersome type that Dr. Starr uses can be standardized very well. Despite the fact that the author's instruments cannot be standardized, they measure wave lengths and derive conclusions from them. Certainly, on a research basis, this would be a debatable procedure.

Dr. Dock, the senior author, has been a pioneer in so many adventures in medicine and has been right so many times—though, as with all pioneers, he is sometimes wrong—it would not surprise the reviewer to find that the above statements in regard to the clinical use of this instrument will be archaic some day.

[5]**Modern Clinical Psychiatry**

ARTHUR P. NOYES, M. D., *Superintendent, Norristown State Hospital, Norristown, Pa.; Associate Professor of Psychiatry, Graduate School of Medicine, University of Pennsylvania. Fourth edition. 609 pages. $7. Philadelphia, W. B. Saunders Company, 1953.*

The fourth edition of this standard textbook has been revised considerably. The various entities are classified according to the most recent classification of the American Psychiatric Association, and the text is much more in accordance with present concepts concerning personality disturbances.

The work is definitely one of the better textbooks, designed primarily for the student and the general practitioner. Like previous editions, it covers all of the major entities in a comprehensive fashion, yet in simple enough language so that the nonpsychiatrist physician can understand the terminology. It does retain sufficient dynamic material to be of real interest in spite of this simplification.

All forms of psychiatric treatment are adequately discussed. The reader would do well to keep this as a reference book. The reviewer finds it helpful in organizing material for teaching medical students.

[4]*Samuel A. Shelburne, M. D., F.A.C.P., Dallas.*
[5]*Howard M. Burkett, M. D., Dallas.*

[6]**Mechanisms of Urologic Disease**

DAVID M. DAVIS, M. D., *Professor of Urology Emeritus, Jefferson Medical College, Philadelphia. 156 pages. $4.50. Philadelphia, W. B. Saunders Company, 1953.*

This small book is a new approach to urologic pathology, namely, from a physiologic rather than an anatomic viewpoint. It is organized on the basis of eight different types of pathologic changes: obstruction, infection, stone formation, neoplasm, congenital malformation, trauma, foreign body, and neurogenic, dealing with each as it applies to the entire urogenital tract.

The author, well qualified by a lifetime of teaching and practice of urology, presents a work that beginners and general practitioners can use to systematize the body of urologic knowledge and from which the urologic specialist can benefit in gaining a new viewpoint of urologic pathology. It has a minimum of charts and tables, and the bibliography is rather extensive; hence, it is easy to read and serves well as a lead to further study if one is interested in any particular phase.

[7]**Drug Addiction Among Adolescents**

Sponsored by the Committee on Public Health Relations of the New York Academy of Medicine with the assistance of the Josiah Macy, Jr. Foundation. 320 pages. $4. New York, Blakiston Company, 1953.

This book is a compilation of two conferences held at the New York Academy of Medicine on November 30, 1951, and March 13 and 14, 1952. They were sponsored by the Committee on Public Health Relations and all agencies interested in the problem were asked to attend and to contribute information. The thinking of authorities in medical, psychiatric, sociologic, educational, and law enforcement fields is presented.

The roots of ill health no longer are sought only in the physical environment, but are found in psychologic and social fields. The World Health Organization has defined health as including "physical, psychological, and social well-being." With this in mind, representatives of the physical, biologic, and social sciences are needed in this field of adolescent problems as particularly identified in the use of drugs. There is an urgent need for more effective cooperation between the varieties of professions and agencies in both prevention and treatment of drug users. A result of the conference was the fact that addiction must be seen, not as a problem of moral degeneracy, nor merely as a failure of law enforcement, but rather as one symptom of the serious deprivations suffered by many children in crowded cities.

Medicine has a special role of leadership in this situation because medicine is both a biologic science and a social science, while the newer understanding of psychosomatic relations provides a bridge across the gap which heretofore has so sharply divided the biologic from the social sciences. One fact especially stands out: the continuation of drug use depends to a great extent on the euphoria the individual receives. A new drug, N-allyl-nor-mor-phine, which counteracts the effects of morphine, is being developed. It also can be used in the identification of addicts.

The report of this conference is of interest to any social agency and any lay person interested in the adolescent. Physicians as members of a social order as well as being directly responsible for the well-being of their communities would do well to read it. The psychiatrist and the general

[6]*Emile Maltry, Jr., M. D., Wichita Falls.*
[7]*Mrs. A. B. Pumphrey, Fort Worth, Chairman, Committee on Mental Health, Woman's Auxiliary to the Texas Medical Association.*

practitioner will find much of recent findings in the problems and treatment of the adolescent drug user to help them.

Holt Pediatrics

L. EMMETT HOLT, JR., M. D., *Professor of Pediatrics, New York University College of Medicine; Director, Children's Medical Service, Bellevue Hospital; Rustin McIntosh Carpentier Professor of Pediatrics, Columbia University; and Director of the Pediatrics Service in the Babies Hospital, New York. Twelfth edition. 1542 pages. $15. New York, Appleton-Century-Crofts, 1953.*

The last previous edition of this standard textbook was published in 1940. The new edition has been completely rewritten by the author and sixty-nine collaborators, who have succeeded in presenting a complete, up to date textbook for students which also should be a desk reference for all practicing physicians.

New drugs and their applications are fully discussed. Modern concepts of mental diseases in children are presented in a readable form. The new chapter on disturbed fluid and electrolyte balance is of special interest.

Second Annual Report on Stress

HANS SELYE, M. D., Ph. D. *(Prague)*, D. Sc. *(McGill)*, F.R.S. *(Canada), Professor and Director of the Institut de Médecine et de Chirurgie expérimentales, Université de Montréal, and* ALEXANDER HORAVA, M. D. *(Lausanne), Research Associate and Librarian of the Institut de Médecine et de Chirurgie expérimentales, Université de Montréal. 526 pages. $10. Montreal, Canada, Acta, Inc., Medical Publishers, 1952.*

This is the second annual supplement to "Stress," which was published by Dr. Selye in 1950. The book is divided into two parts, general physiology and pathology of stress and special physiology and pathology of stress. The section on principal objections against the stress concept is well presented and many references are given. The bibliography is arranged alphabetically by author. More than 4,000 publications were noted and the literature for 1951 is reviewed. The book is essentially a reference tool for medical librarians and endocrinologists. The book is easy to use, and the material on any special subject can be found in the detailed subject index.

[8]Antibiotics

ROBERTSON PRATT, Ph. D., *Professor of Pharmacognosy and Plant Physiology, University of California College of Pharmacy; Consultant on Antibiotics; and* JEAN DUFRENOY, D. Sci. *(Paris), Research Associate in Antibiotics, University of California College of Pharmacy. Second edition. 398 pages. $7.50. Philadelphia, J. B. Lippincott Company, 1953.*

This book was written to "present in a succinct, integrated plan the facts and principles of fundamental and permanent value relating to antibiotics." The material as presented in the first edition has been revised and new material included in the second edition in the light of some 7,000 research papers which have appeared in the four year interval following the publishing of the first edition.

The presentation has been organized into four parts: fundamental aspects, industrial aspects, applied aspects, and modification of biologic and social systems. The fundamentals of antibiosis; the production and control aspects; the individual antibiotics with their general uses in the medical, dental, and veterinary fields; resistant strains of microorganisms; and the mechanism of antibiotic action are covered along with some interesting thoughts on the social and economic aspects of antibiotics.

The type of the book is large and easily read, and there are numerous aids in the form of charts, graphs, and diagrams. The volume is sufficiently comprehensive to be informative to one interested in the health sciences and contains numerous references of suggested reading material for the person who wishes to develop the subject in more detail.

[9]Managing Your Coronary

WILLIAM A. BRAMS. *158 pages. $2.95. First edition. Philadelphia, J. B. Lippincott Company, 1953.*

The purpose of this book is to give patients with coronary thrombosis "a better understanding of the nature of their illness, the aim of treatment and the prospects for useful employment after the attack has subsided." Various aspects of incidence, etiology, pathology, diagnosis, therapy, convalescence, and rehabilitation and reemployment are ably discussed in nontechnical language. The subject matter is medically accurate, and where controversial matters are discussed, the author generally prefers the conservative approach but presents the various shades of opinion without bias.

The one objection is the part of the chapter on diagnosis which relates to history taking, physical examination, and differential diagnosis. This could be deleted since it serves neither of the three purposes for which the book was written, adds unnecessarily to its length, and offers the author too great an opportunity to recount his successes in diagnosis and to use the pronoun "I" much too frequently. The mood of this section is evident on page 48: "In the light of this combination of symptoms, his doctor wisely put him to bed and called me in on the case."

Except for this criticism, this book may be read with profit by patients wishing more detailed information about their disease, but the impersonal printed page can never substitute for the specific instructions and warnings directed to the patient by his own physician.

[10]A Textbook of Orthopedics

With a Section on Neurology in Orthopedics. M. BECKETT HOWORTH, M. D., *Clinical Professor of Orthopedic Surgery, New York University Post-Graduate Medical School. 1,110 pages. $16. Philadelphia, W. B. Saunders Company, 1952.*

Dr. Howorth has chosen a Herculean task in presenting a new textbook in a field where so many have failed. The effort is laudable and deserving of praise. However, the reviewer feels that this volume, in its inaugural edition, leaves much to be desired before it finds a niche among the classics.

The author has divided the text into four sections to avoid confusion and repetition. The initial section of "Introduction and Basic Principles" concerns mainly a history of orthopedic surgery and a fundamental description of the anatomy and physiology of the musculoskeletal system. The latter is much too general in scope for value and will undoubtedly be one of the generally unread portions of the text.

The second section concerns regional orthopedics and serves only as a classification to include one of the brighter aspects of the book, that being the fine discussion of the hand written by Dr. J. William Littler, a contributor. It is of significance that twenty-two pages of this section are devoted to posture and obesity with only three pages dealing with the shoulder, shoulder girdle, and elbow.

[8]*Stephen B. Longino, Jr., M. D., Sulphur Springs.*

[9]*Sidney Schnur, M. D., Houston.*

[10]*David R. Oliver, M. D., San Antonio.*

The third section, entitled "Orthopedic Disorders," actually contains the meat of the volume, so far as orthopedic surgery is concerned. The sections on congenital anomalies and metabolic disorders contributed by Dr. Donovan J. McCune are excellent. The author's discussion of congenital dislocation of the hip and slipped femoral epiphysis indicates his thorough knowledge and study of these subjects. The discussion of fractures, infections of bone, and bone tumors is incomplete for advanced students or practitioners.

The final section contributed by Dr. Fritz Cramer and entitled "Neurology in Relation to Orthopedic Surgery" is the highlight of the volume. These 180 pages contain a clear, concise treatise on neurologic conditions of interest to all orthopedic surgeons. If for no other reason, this last section is justification for this textbook.

[11]Fractures and Joint Injuries

SIR REGINALD WATSON-JONES, M. Ch. Orth., F.R.C.S., F.A.C.S. *(Hon.), Orthopedic Surgeon to His Majesty the King; Director of Orthopedic and Accident Service, London Hospital; Senior Surgeon to the Robert Jones and Agnes Hunt Orthopaedic Hospital. Fourth edition. Volume 1, 443 pages. $22 per set. Baltimore, Williams and Wilkins Company, 1952.*

This is the first volume of the fourth edition of Watson-Jones. The preceding sentence sounds much like a biblical reference, and as such it might well be considered. This text, in its past three editions, has become a "Bible of Fractures and Dislocations" in the orthopedic world.

Although the general appearance of this volume is similar to its predecessor, the contents and illustrations are considerably altered, chiefly by addition. New chapters dealing with shock and the adaptation syndrome have been added. The lessons learned in World War II are evident in revised chapters on compound fractures, open reduction (including intramedullary nailing), vascular injuries, and nerve injuries. The unique chapter on clinical and radiologic diagnosis continues, as in previous editions, to be a stimulating method of teaching and information. Many new illustrations, frequently in color, add to the beauty of this new volume.

Because of the concise, often dogmatic, method in which the subject matter is presented, Watson-Jones will always be a favorite with students and orthopedists the world over. This new edition certainly justifies its eminent position in medical literary classics.

[12]Practical Blood Grouping Methods

ROBERT L. WALL, M. D., *Department of Research Medicine, Ohio State University Hospital, Columbus; Formerly, Blood Research Section, Department of Biologic Products, Army Medical Department Research and Graduate School, Washington, D. C. A Monograph in the Bannerstone Division of American Lectures in Hematology. 175 pages. $5. Springfield, Ill., Charles C Thomas, 1953.*

This book represents another monograph in the American lecture series which has embodied many different subjects. As such, it attempts a wide coverage in a short space, making it considerably less informative than the standard works on blood antigens and antibodies and the techniques involved in their manipulations, and possibly making it more comprehensive than the usual reviews in standard journals dealing with this subject. The bibliography is satisfactory. Certain techniques are satisfactorily outlined, but in general interpretation is limited. In view of the availability of more comprehensive works, this book seems best suited as an introduction to the subject for those entering this field. It cannot be recommended as a standard reference.

[13]Therapeutics in Internal Medicine

By Eighty-Four Authorities. Edited by FRANKLIN A. KYSER, M. D., F.A.C.P., *Assistant Professor of Medicine, Northwestern University Medical School, Chicago; Attending Physician, Evanston Hospital, Evanston, Ill. Second edition. 830 pages. $15. New York, Paul B. Hoeber, Medical Book Department of Harper and Brothers, 1953.*

This volume has been prepared by eighty-four authorities whose teaching experience and investigations in the field of internal medicine have been outstanding. The commonly accepted methods of therapy are given in addition to some of the preferences of the authors. Even though this book has been published fundamentally as a reference to treatment of internal diseases, it does have a liberal amount of clinical and basic science considerations to make treatments described more understandable.

The arrangement of the book is excellent and the type easy to read, making quick reference easy. There is in addition a final chapter on symptomatic treatment which is excellent and complete. Even though the treatment of many symptoms is discussed previously in the book, all are collected in one chapter for easy reference. This chapter alone offers many valuable adjuncts for the relief of troublesome and frequently encountered complaints. At the end of the final chapter is an appendix of useful diets and tables. In general the statements on dosage are given clearly, accurately, and in detail. Such an excellent volume as this on therapeutics in internal medicine should find great appeal and usefulness not only to the internist but also to those doing general work who need quick and complete reference to treatment of disorders of internal medicine.

[14]Unipolar Lead Electrocardiography and Vectorcardiography

EMANUEL GOLDBERGER, M. D., F.A.C.P., *Cardiologist and Attending Physician, Lincoln Hospital, New York; Lecturer in Medicine, Columbia University. Third edition. 601 pages. $10. Philadelphia, Lea & Febiger, 1953.*

This textbook of electrocardiography is written in a clear and concise style. It will serve the beginner as well as the more experienced student of electrocardiography in everyday interpretation of electrocardiographs. The first section gives the principles of electrocardiography. A discussion of the normal electrocardiogram comprises the second section. Abnormal electrocardiography patterns are presented in section three. Section four deals with normal and abnormal cardiac rhythms. The final section on vectorcardiography is the best the reviewer has read on this rather complicated subject.

This book is recommended without reservation as a basic text for the clinician who studies electrocardiograms made on his patients and wishes to keep abreast of developments in the field.

[15]Office Management of Ocular Diseases

WILLIAM F. HUGHES, JR., M. D., *Professor and Head, Department of Ophthalmology, University of Illinois College of Medicine; Ophthalmologist-in-Chief, Illinois Eye and Ear Infirmary, Chicago. 452 pages. $9. Chicago, Year Book Publishers, 1953.*

Although this book could much more appropriately be called a "handbook" because it contains much more than

[11]*David R. Oliver, M. D., San Antonio.*
[12]*E. E. Muirhead, M. D., Dallas.*
[13]*Alfred L. Lane, M. D., Corpus Christi.*
[14]*Horace L. Wolf, M. D., Amarillo.*
[15]*James D. McCall, M. D., Mineral Wells.*

pertains to "office management," it is nevertheless a competent work, interesting and useful to both the general practitioner and the specialist. The author has stated in his preface that the chapters on beta irradiation and chemical burns show his special interest; it seems to the reviewer that he might have added two more chapters, those on diseases of the conjunctiva and on the cornea, which are in themselves worth the price of the book. These are done carefully and, although comprehensive in their content, are so constructed that the busy practitioner can use them as a quick reference to almost any phase of the subject matter. It is true that there is some material in the book that could be deleted, such as physiologic optics, but the author has endeavored to include as much diagnostic and treatment material as possible to make this book worth while.

The illustrations and the tables are first rate although it is to be regretted that the former are all black and white. The ophthalmic formulary is the last chapter in the book and seems to be as up to date and complete as one could expect in a textbook of this kind.

As a whole this book is well done and would be an asset to any ophthalmologist's book collection as well as that of the general practitioner.

[16]Diseases of Children

Edited by ALAN MONCRIEFF, C.B.E., M. D., F.R.C.P., *Nuffield Professor of Child Health, University of London, and* PHILIP EVANS, M. D., M. Sc., F.R.C.P., *Physician to the Children's Department and Director of the Department of Child Health, Guy's Hospital. Fifth edition. Volume 1, 1014 pages; Volume 2, 1973 pages. Both volumes $21. London, Edward Arnold and Company, 1953. Distributed by Williams and Wilkins, Baltimore.*

"Diseases of Children" consists of two volumes with contributions from fifty authors. The book, published first in 1913, is an outstanding contribution from Great Britain to pediatrics. Of particular interest is the chapter on vital statistics and administrative aspects, which delves into the early history of infant mortality in England. New sections in this edition include causes of congenital malformations, growth and development, drug therapy, endocrine disorders, and congenital heart disease. The chapter on infant feeding presents views in keeping with newer methods and concepts prevalent in the United States. In general, this edition is similar to standard American textbooks on pediatrics. There are numerous illustrations, tables, photographs, and roentgen-ray prints which add immeasurably to the volume. Of interest is the style in which it is written. This treatise on pediatrics should be a valuable addition to any medical library.

[17]The Obstetrical Forceps

L. V. DILL, M. D., F.A.C.S., *Assistant Professor, Obstetrics and Gynecology, Georgetown University School of Medicine, and Consultant, Obstetrics and Gynecology, Army Medical School and Walter Reed General Hospital, Washington, D. C. 156 pages. $5.25. Springfield, Ill., Charles C Thomas, 1953.*

This book is the first attempt to reach publication devoting itself entirely to this subject. It is a readable book with a large number of illustrations. It covers briefly the history of forceps, indications for their use, technique, and complications. It covers briefly the various types of forceps and gives the author's version of how they should be used.

The mechanics of delivery and forceps application are perhaps oversimplified, and one is left with the impression that the use of forceps is of less importance in general practice than it actually is.

It is hardly the type of book that could be used as a textbook and adds little to what has been written in standard textbooks.

[18]The Radiology of Bones and Joints

JAMES F. BRAILSFORD, M. D., Ph. D., F.R.C.P., F.I.C.S. (Hon.), *Emeritus Director of Radiological Studies in Living Anatomy, University of Birmingham; Consulting Radiologist to the Queen Elizabeth Hospital, Royal Orthopaedic Hospital, Accident Hospital and Warwickshire Orthopaedic Hospital. Fifth edition. 875 pages. $19. Baltimore, Williams and Wilkins Company, 1953.*

"The Radiology of Bones and Joints" is a comprehensive and completely illustrated text on all diseases of the bones and joints. The author has correlated the literature with his long experience in radiology, pathology, and clinical medicine in publishing this textbook.

Each disease in the bones and in the joints is illustrated, and the pathology, along with the diagnosis, is discussed. The book is valuable as a reference text, especially in the fields of radiology, orthopedics, and general practice.

The author is a senior British radiologist whose authority was recognized by an invitation to speak in America. He spent two months speaking in most of the medical centers in 1949.

[19]Diuretic Therapy

ALFRED VOGL, M. D., *Assistant Professor of Clinical Medicine, New York University College of Medicine; Formerly, Associate Visiting Physician, Policlinic Hospital, Vienna, and Clinical Assistant, Guy's Hospital Medical School, London. 248 pages. $5. Baltimore, Williams and Wilkins, 1953.*

This is the initial edition of a small book which should prove useful for the internist, the practitioner of general medicine, and the intern. Dr. Vogl has done a commendable job of distilling clinically helpful information from 725 bibliographic references and from his personal experience with the rational and scientific exhibition of diuretic medications.

Naturally, there are some facets in the treatise concerning which shadings of contrary opinion may be expressed. Some practitioners would be reluctant to administer intramuscularly a certain drug to a patient who had previously manifested a definite hypersensitive systemic reaction to that drug given intravenously. Concerning Decholin it is stated, "There is no evidence of toxicity . . . in man." A recent report of a serious untoward reaction to the injection of a small amount of Decholin probably warrants qualification of this statement. The author's views on safe dosage schedules for the administration of organic mercurial diuretics may be challenged by some as too heroic. The emergence of diuretic carbonic anhydrase inhibitors apparently has postdated the writing of this book.

This reviewer especially appreciated Dr. Vogl's concise and readable literary style, the orderly way in which he organized and presented the essence of a tremendous subject, and the major substance of his views relating to the clinical use and abuse of diuretic agents. The chapter on antidiuretic agents is considered particularly meritorious.

It is felt that there is a deserved space for "Diuretic Therapy" in the library of the physician who has occasion to employ diuretic therapy.

[16]*Donald H. McDonald, M. D., Abilene.*
[17]*M. D. McCauley, M. D., Austin.*
[18]*L. M. Vaughan, M. D., Houston.*
[19]*James Y. Bradfield, M. D., Dallas.*

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

PHYSICIANS STUDY

A preliminary report by the American Medical Association's Council on Medical Education and Hospitals finds that the average practicing physician devotes the equivalent of 83.3 eight-hour days a year to keeping up with what is happening in the field of medicine. This survey is based on data compiled on personal visits to more than 220 institutions engaged in postgraduate medical education and questionnaires filled out by 5,000 physicians from a random sample of 17,000 practicing physicians throughout the country.

The survey shows that more than 41,000 practicing physicians took some form of postgraduate medical course last year. Physicians responding to the questionnaire indicated that about one-third of the time spent in continuing their education is devoted to medical reading and another one-third to professional contacts. The remaining one-third is devoted to hospital staff meetings, attendance and participation in medical society and specialty group meetings at the local, state, and national level, and postgraduate courses.

The chief reason listed for not taking postgraduate courses is the lack of someone to take care of patients while the physician is away. More than 90 per cent of the responding physicians felt that the maximum time they could be away from their practice was less than fifteen days.

The final report on the survey is expected to be ready about the middle of the year.

TEXAS MEDICAL ASSOCIATION

ENTERTAINMENT FOR ALL

In addition to having outstanding guest speakers and a full schedule of scientific meetings at the annual session, a wealth of opportunity for a good time exists for Association and Auxiliary members and guests from the time they arrive at the convention city until the time they depart. The Committee on General Arrangements hopes that each person will take time to attend the parties and entertainment provided.

Perhaps the highlight of the social life at the convention this year will be the President's Party with Buffet, Tuesday, May 4, beginning at 7:30 p. m. This will be held at La Villita, a restored Spanish town with all the atmosphere of "A Night in Old San Antonio," which the entertainment is scheduled to depict. After the buffet Eddie Martinez and his company of 18 performers will entertain, and there will be dancing from 10:30 until 12:00 midnight.

The General Meeting Luncheon Wednesday, May 5, will be open to members of the Association, Woman's Auxiliary, guests, and visitors, as will be the President's Party. This event will be in the Grand Ballroom, Gunter Hotel, at 12:30 p. m.

In addition to the larger group entertainment, banquets for alumni groups have been planned for May 3 at 6 p. m. Banquets have been arranged for the University of Texas Medical Branch, Baylor University College of Medicine, Southwestern Medical School, Tulane University, Louisiana State University, the University of Tennessee, and Vanderbilt University. Dr. William D. Montgomery is general chairman, and Dr. William M. Center is co-chairman.

Fraternities have planned parties for May 4 from 6:30 until 8:00 p. m. Alpha Kappa Kappa, Nu Sigma Nu, Phi Beta Pi, Phi Chi, Phi Delta Epsilon, Phi Rho Sigma, and Theta Kappa Psi fraternities have arranged for parties at the convention. Dr. William J. Johnson, Jr., is general chairman.

Of interest to many Association members will be the Texas Medical Association Golf Tournament at the San Antonio Country Club, May 3, 1:00 p. m. Prizes will be awarded to winners of the golf tournament. The chairman is Dr. John B. Case.

Tickets should be bought or reservations made to participate in these various events promptly. Details for all events appear in the program in the March JOURNAL, pages 172-191.

Williston Becomes Assistant Executive

C. Lincoln Williston assumed the duties of assistant executive secretary of the Texas Medical Association on April 2.

During the past seven years, Williston has been manager of public relations for the University of Illinois Medical Center in Chicago. In addition, he was chairman of the Medical Schools Section, American College Public Relations Association; lecturer in public relations, Northwestern University; and chairman, Section on Public Relations, Tri-State Hospital Assembly.

Williston was awarded the bachelor of science degree by the University of Illinois in 1942 and served as a captain with the United States Air Force on Guam during World War II. He is married and has two daughters, aged 5 and 3 years.

NEW APPOINTEES ANNOUNCED

Dr. Tate Miller, Dallas, a member of the Committee on Medical History of the Texas Medical Association, was named April 5 to the chairmanship, which had been vacant since the death July 31, 1953, of Dr. H. R. Dudgeon, Sr. of Waco. At the same time Dr. Felix P. Miller, El Paso, was appointed to fill the vacancy on the committee.

Also named to serve the Association was Dr. J. C. Terrell, Stephenville, appointed by the President as a special delegate to the Private Hospitals and Clinics Association of Texas.

Dr. J. M. Travis, Jacksonville, resigned April 12 as chairman and a member of the Library Endowment Committee. Dr. Travis is secretary of the Association.

COUNTY SOCIETIES

Bell County Society

February 3, 1954

(Reported by F. M. Hammond, Secretary)

Diagnosis and Treatment of Face Pain—W. A. Johnson, D.D.S., Temple.

Bell County Medical Society met at Temple on February 3 for a business meeting. After Dr. Johnson presented the above paper, J. C. Walker discussed it.

A brief report of the third annual meeting of county medical society presidents and secretaries was given by F. M. Hammond, Jr.

Bowie County Society

January 14, 1954

Ambrose Storck, New Orleans, professor of clinical surgery at Tulane University, gave a scientific lecture at the

January 14 meeting of the Bowie and Miller Counties Medical Societies at Texarkana.

Brazoria County Society

February 25, 1954

(Reported by Carlos E. Fuste, Jr., Secretary)

Chemotherapy of Leukemia—Robert Hettig, Houston.

The Brazoria County Medical Society met at a dinner meeting February 25 at the Community House in Freeport and heard the above speaker. The president, William D. Nicholson, presided over the business meeting.

Cameron-Willacy Counties Society

February 15, 1954

(Reported by Harry A. Miller, Executive Secretary)

Diagnosis in Problem of Gallbladder Disease—Robert Nixon, San Antonio.

The Cameron-Willacy Counties Medical Society met with its auxiliary February 15 for a dinner at San Benito. Seventy-one were present. The above scientific report was given, and a question and answer period followed.

James C. George withdrew as chairman of the board of censors so that he might have more time for his duties as president of the society. John Brown, San Benito, was nominated to serve in his place.

Cass-Marion Counties Society

January 13, 1954

Diseases of Colon and Their Surgical Treatment—William M. Dawson, Texarkana.

Radiological Findings in Colon Disease—Cyrus P. Kline, Texarkana.

After a dinner with the woman's auxiliary, the following officers were elected for Cass-Marion Counties Medical Society at the January 13 meeting in Atlanta: James Brooks, Jr., Atlanta, president; A. J. Woods, Jefferson, vice-president; Roy S. Bucy, Linden, secretary; and William Terry, Jefferson, delegate.

The above scientific program was heard by the society.

Cherokee County Society

January 26, 1954

Mr. N. C. Forrester, Austin, executive secretary of the Texas Medical Association, spoke to the Cherokee County Medical Society at its January 26 meeting in Rusk. Mr. Forrester spoke on forthcoming legislation concerning the medical profession.

New officers of the society are Harbert Davenport, Jr., Jacksonville, president; F. H. Brigham, Rusk, vice-president; and T. H. Cobble, Rusk, secretary.

Clay-Montague-Wise Counties Society

January, 1954

New officers of Clay-Montague-Wise Counties Medical Society are David Bryant, Bridgeport, president; L. L. Pickett, Henrietta, vice-president; Harold Shilling, Bridgeport, secretary-treasurer; J. T. Darwin, Decatur, delegate; J. H. Valcki, Decatur, board of censors; and John Major, Nocona, alternate delegate.

Cooke County Society

January 18, 1954

Allergy—James Holman, Dallas.

New officers of the Cooke County Medical Society were installed at the January 14 meeting at Gainesville. They are Ben Fisch, president; Ira Thomas, vice-president; George Evashwick, secretary; Charles Mills, delegate; and Dr. Thomas, Vincent Cirone, and Silas Yarbrough, censors.

Dr. Holman's speech emphasized new treatment of asthma.

Dallas County Society

January 14, 1954

Frank A. Selecman was installed as president of the Dallas County Medical Society at a dinner January 14 attended by 400 members and their guests. Mr. Clarence Manion, former dean of the law school at Notre Dame University and more recently chairman of the Commission on Intergovernmental Relations, was the principal speaker. Other officers installed were Harry M. Spence, vice-president; R. A. Trumbull, president-elect; Glenn D. Carlson, secretary; and Porter K. Mason, treasurer. W. W. Fowler was named secretary emeritus and presented an appreciative plaque for thirty-four years of service to the society as its secretary.

Falls County Society

January 26, 1954

Falls County Medical Society met in Marlin January 26, and heard Franklin G. Ebaugh, a Denver psychiatrist, speak on what constitutes normality.

Gregg County Society

January 24, 1954

Gregg County Medical Society met January 24 in a joint session with the East Texas chapter of the American Academy of General Practice. Speakers for the meeting were W. P. Devereux, gynecologist; T. Haynes Harvill, internist; and J. E. Miller, Jr., radiologist. The speakers were from the Southwestern Medical School of the University of Texas, Dallas.

Hale-Floyd-Briscoe-Swisher Counties Society

February 9, 1954

(Reported by John C. Long, Jr., Secretary)

Problem of Differential Diagnosis with Patients with Chest Pain—Horace L. Wolf, Amarillo.
Discussion—M. C. Schlecte, Plainview.

At the February 9 meeting of the Hale-Floyd-Briscoe-Swisher Counties Medical Society in Plainview, the above scientific program was presented. N. E. Greer, Lockney, was elected to honorary membership. It was announced that Wa T. Mok, Amarillo, would speak at the March meeting.

March 9, 1954

(Reported by John C. Long, Jr., Secretary)

Treatment of Burns—Dr. Wa T. Mok, Amarillo.

John C. Long led a discussion of the above subject after Dr. Mok spoke. The regularly scheduled April meeting was cancelled so that members might attend the Third District Medical Society meeting.

Harris County Society

February 10, 1954

(Reported by Mrs. W. M. Palm, Public Relations Secretary)

Functional Dyspepsia—Belton G. Griffin, Houston.

The Harris County Medical Society met February 10 at the Baylor University College of Medicine Auditorium, Houston. Following the presentation of the above discussion, the business meeting was held.

The society voted to levy an assessment of $18 for the remainder of 1954 to pay the society's pro rata share of maintenance of the new Houston Academy of Medicine Library Building. An additional $2 assessment was made to employ additional personnel for the executive office.

It was announced that it would be necessary to amend the society's by-laws to fill the office of president-elect, which is vacant due to the sudden death of L. E. Williford. The amendment was read, and the election will be held at an early date.

The medical jurisprudence and public relations board and the veterans affairs committee announced a special meeting which they will sponsor on February 24, with a distinguished panel of speakers discussing current problems facing the medical profession. Ernest B. Howard, Chicago, assistant secretary of the American Medical Association, will speak on the "President's Health Program and the AMA Position." F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, will discuss "Implementing the Program on a Local and State Basis," and Everett C. Fox, Dallas, will speak on the "Veteran Problem."

Hidalgo-Starr Counties Society

January 15, 1954

Aspects of Blood Coagulation—H. E. Whigham, McAllen.

Paul H. Frenzel, Donna, was installed as president of the Hidalgo-Starr Counties Medical Society at a January 15 meeting at Pharr. Separate business meetings were held after a joint dinner by the society and its woman's auxiliary.

Limestone County Society

January 5, 1954

New officers were elected at the Limestone County Medical Society meeting January 5 at Mexia. T. R. Wilson, Groesbeck, was reelected president; G. C. Smith, Jr., Mexia, was named vice-president; and Stanley Cox, Groesbeck, was reelected secretary.

Lubbock-Crosby Counties Society

February 2, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Vaginal Hysterectomy Without Prolapse—Joseph Kelso, Oklahoma City.
Discussion—Charles Nash, Sam Dunn, and Warren B. Poole, Lubbock.

The Lubbock-Crosby Counties Medical Society met February 2 in Lubbock for a business and scientific session.

A telegram from the chairman of the Council on Medical Jurisprudence of the Texas Medical Association was read urging members to send requests for support of the Bricker Amendment to Texas Senators.

An invitation from R. A. Reid, Levelland, secretary of the Lamb-Bailey-Hockley-Cochran Counties Medical Society, was read inviting society and auxiliary members to hear Clifford Snyder, Galveston, speak on February 5 in Levelland.

Warren B. Poole introduced the guest speaker, who delivered the above discussion and presented a film of the surgical procedure. Dr. Kelso also showed slides demonstrating foreign bodies found in his practice.

March 3, 1954

(Reported by Richard K. O'Loughlin, Secretary)

Treatment of Acute Hand Injuries—William Waldrop, Oklahoma City.

The Lubbock-Crosby Counties Medical Society met March 3 in Lubbock to hear Dr. Waldrop's speech, which was accompanied by slides demonstrating hand and finger injuries and surgical repair.

Frank C. Goodwin, president, reported on the third annual Conference for County Society Presidents and Secretaries.

Nueces County Society

February 9, 1954

(Reported by Gerald S. Ahern, Secretary)

At the February 9 meeting of the Nueces County Medical Society in Corpus Christi, John Howard, assistant professor of surgery at the Baylor University College of Medicine, Houston, discussed his experiences on the Korean battle front.

Polk-San Jacinto Counties Society

January 8, 1954

Ivison Grimes, Camden, was elected president of Polk-San Jacinto Counties Medical Society at its January meeting in Livingston. Also elected were Joe T. Dabney, Jr., Livingston, vice-president, and Paul C. A. Singleton, Corrigan, secretary-treasurer.

Runnels County Society

January 7, 1954

Runnels County Medical Society met January 7 in Ballinger and elected John E. Green, Jr., president; Lloyd Downing, vice-president; Glenn Jones, secretary-treasurer; O. H. Chandler, board of censors; and Charles F. Bailey, delegate. All of the officers are from Ballinger.

Tarrant County Society

February 2, 1954

(Reported by S. W. Wilson, Secretary)

Symposium on Diagnosis and Treatment of Hemoptysis—James O. McBride, Douglas E. Bibby, and John Wiggins, Fort Worth.

Seventy-three members of the Tarrant County Medical Society heard the above scientific discussion when the Tarrant County Medical Society met February 2 in Fort Worth.

Elected to membership were Darrell W. Boren, R. L. Campbell, Werner H. Frietsch, Lee Ray Lawson, James H. Mann, Virginia G. Russell, Henry G. Stephenson, Jr., and Raymond R. Thomas.

Ernest E. Anthony, Jr., gave a detailed report for the legislative committee.

February 16, 1954

(Reported by S. W. Wilson, Secretary)

Tarrant County Medical Society met February 16 in Fort Worth to hear the telephone broadcast originating in Austin, "Recent Advances in Internal Medicine."

Henry G. Gardiner, Jr., was elected to membership in the society.

March 2, 1954

(Reported by S. W. Wilson, Secretary)

Bundie Branch Block—Demetrio Sodi, Mexico, D. F.
Hemodynamics of Compressed Heart by Constrictive Pericarditis—Rudolfo Limon, Mexico, D. F.

At the March 2 meeting of Tarrant County Medical Society in Fort Worth the above scientific program was given by Dr. Sodi and Dr. Limon. Both are professors of medicine at the University of Mexico.

Tom Green-Eight County Society

January 11, 1954

(Reported by Joe L. Cornelison, Secretary)

A called business meeting of the Tom Green-Eight County Medical Society was held January 11. It was decided that the society would not participate in the February or March telephone broadcasts sponsored by the Texas Medical Association. Bills before Congress which would affect health were considered at the San Angelo meeting.

February 1, 1954

(Reported by Joe L. Cornelison, Secretary)

Mental Health—Stephen Weisz, Dallas.

Meeting in joint session with the woman's auxiliary, the Tom Green-Eight County Medical Society heard the above

discussion February 1 in San Angelo, following its business meeting.

Thirty-two members attended the business session, presided over by R. M. Arledge. A motion was passed to allow Mr. John Webb Graham to address the society again regarding his telephone answering service for local physicians.

The society decided that the question of inviting laymen and nonmembers to attend its regular meetings should be decided by the public relations committee.

The society also passed a motion permitting the Planned Parenthood Clinic to have biopsies of and to cauterize cervices when necessary.

March 1, 1954

(Reported by Joe L. Cornelison, Secretary)

At the March 1 meeting of the Tom Green-Eight County Medical Society in San Angelo, the society approved the experimental use of a new poliomyelitis vaccine in San Angelo. Jerome Smith was elected to honorary membership in the society. The scientific program was a discussion on low back pain.

Travis County Society

December 15, 1953

New officers of the Travis County Medical Society were elected at the December 15 meeting at the Texas Medical Association headquarters building in Austin. J. M. Coleman was elected president; Harold L. Williams, vice-president; C. H. McCuistion, secretary; and Sam N. Key, Jr., John F. Thomas, and Charles B. Dildy, delegates.

February 16, 1954

(Reported by C. H. McCuistion, Secretary)

Travis County Medical Society participated in the February 16 telephone postgraduate broadcast on "Recent Advances in Internal Medicine" as the program for the group's meeting at the Texas Medical Association headquarters building in Austin. Members of the faculty of the University of Texas Medical Branch, Galveston, comprised the panel. A film from the American Cancer Society, "Living Insurance," was shown also.

March 9, 1954

(Reported by C. H. McCuistion, Secretary)

Symposium: Diet in Disease—Henry M. Winans, Dallas, Moderator.
Diet in Cardiovascular Disease—Donald Seldin, Dallas.
Diet in Metabolic Disease—Edwin L. Rippy, Dallas.
Diet in Gastrointestinal Disease—Tate Miller, Dallas.

Travis County Medical Society heard the above program, given by Dallas physicians, and broadcast by telephone throughout the state, at the Texas Medical Association building in Austin on March 9.

Wichita County Society

January 12, 1954

Wichita County Medical Society met at the Wichita Falls Country Club January 12 and heard John Goode, professor of surgery at the Southwestern Medical School of the University of Texas, Dallas, speak on surgery in the aged.

James Lee, president, presided over the business meeting at which the society adopted resolutions favoring the Bricker amendment.

Wharton-Jackson-Matagorda-Fort Bend Counties Society

March 9, 1954

(Reported by S. E. Thompson, Secretary)

A panel discussion on anesthesia in general practice, under the direction of C. R. Allen and Leo Duflot, faculty members at the University of Texas Medical Branch, Galveston, was presented at the March 9 meeting of Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society in Richmond.

Wilbarger County Society

January 12, 1954

F. B. Steele was elected president of the Wilbarger County Medical Society January 12 at Vernon. J. J. Slaugenhop is vice-president, and C. Curtis Allen was reelected secretary-treasurer. The official delegate to the 1954 state convention will be A. L. Borchardt.

DISTRICT SOCIETIES

First District Society

February 12, 1954

(Reported by H. D. Garrett, Secretary)

Control of Pain in Childbirth—Celso C. Stapp, El Paso.
Early Diagnosis and Treatment of Congenital Dislocation of Hip—C. A. Robinson, Kermit.
Newer Hypertensive Agents—Ben Cooley, El Paso.
Some Common Eye Conditions That Should Be Recognized in General Practice—Newton F. Walker, El Paso.
Congenital Renal Anomalies as Cause of Pain and Disease—Robert F. Thompson, El Paso.
Early Diagnosis of Tumors of Lung—Maynard S. Hart, El Paso.
Surgical Treatment of Thyroid Disease—Leigh E. Wilcox, El Paso.

The program outlined above was presented at Pecos on February 12 at the annual meeting of the First District Medical Society after a luncheon with the district woman's auxiliary.

New officers were elected as follows: Charles E. Oswalt, Jr., Fort Stockton, president; H. M. Gibson, El Paso, vice-president; and H. D. Garrett, El Paso, secretary-treasurer.

Before the dinner, at which George Turner, El Paso, President of the Texas Medical Association, was speaker, cocktails were served by the Reeves-Ward-Winkler-Loving-Culberson-Hudspeth Counties Medical Society.

Forty-seven members attended.

Mrs. E. W. Coyle, San Antonio, President of the Woman's Auxiliary to the Texas Medical Association, spoke at the auxiliary meeting. About forty wives attended.

Ninth District Society

March 25, 1954

(Reported by Lyman C. Blair, Secretary)

Observations on Tubal Pregnancies—S. D. Coleman, Navasota.
Peptic Ulcer Problem—William T. Arnold, Houston.
Backache: When Can a Urologist Help?—Michael K. O'Heeron, Houston.
Present Status of Steroid Therapy in Rheumatoid Arthritis—Jesse W. Hofer, Houston.
Intra-Articular Use of Hydrocortisone Acetate in Rheumatic Diseases—M. D. Levy, Jr., Houston.
Diagnosis of Herniated Lumbar Disk—Robert J. Goodall, Houston.
Modern Therapy of Severely Injured Patient—John D. Staub, Houston.
Comparative Efficacy of Various Oral Diuretics—Ralph V. Ford, Houston.
Convulsions: Their Significance in General Practice—Henry S. Meyer, Houston.

The program outlined above was presented to members of the Ninth District Medical Society when they met March 25 in Brenham. Guest speaker was Dr. Troy Shafer, Harlingen, chairman of the Committee on Public Relations of the Texas Medical Association.

Thomas H. Giddings, Brenham, was elected president: Joseph T. Dabney, Jr., Livingston, vice-president; Lyman C. Blair, Houston, secretary-treasurer. J. T. Billups, Houston, was nominated Councilor of the district.

AUXILIARY SECTION

COUNTY AUXILIARIES

The *Nueces County Auxiliary* recently conducted an educational program designed to teach the different types of free medical services available to county residents. Tours were conducted through Driscoll Foundation for Children, the Crippled Children's Hospital, and Memorial Hospital during the first week of March by members of the auxiliary. At the February 19 meeting in Corpus Christi, Mrs. E. King Gill was installed as president of the Nueces County Auxiliary. Mrs. Paul Gray is president-elect.

Speakers for the *Travis County Auxiliary* at its January 19 meeting in Austin were Miss Ruby Neubauer, administrator of the Johns Clinic and Hospital in Taylor, who talked on vocational nursing, and Miss Elizabeth King, nursing arts director at Brackenridge Hospital, who discussed professional nursing.

Tarrant County Auxiliary had a guest day luncheon and style show March 12 and a "Tonics and Sedatives" variety show March 27 for the benefit of its nurse scholarship fund. Talent was from auxiliary and medical society members. More than $600 was raised.

The *Bexar County Auxiliary* heard Dr. W. W. Bondurant, Jr., speak on "Community Nursing Service" at its March 12 meeting. The mental health committee furnished a team of workers for the financial drive of the Guidance Institute and Bexar County Society of Mental Health.

Another auxiliary having a program on nursing was *Cass-Marion Counties Auxiliary*. Meeting at the home of Dr. and Mrs. H. L. D. Jenkins, Hughes Springs, on March 10, members heard Mrs. Eva Rabitarle, American Red Cross nurse, speak on home nursing.

Horace Cardwell, administrator of Memorial Hospital, spoke on nurse recruitment to the *Angelina County Auxiliary* at the home of Mrs. T. A. Taylor, Lufkin, January 26. Plans were made for the nurse recruitment drive at the January 15 meeting of *Armstrong-Donley-Childress-Collingsworth-Hall Counties Auxiliary* at the home of Dr. and Mrs. Jack Fox, Childress.

Mrs. K. W. McFatridge was elected president of the *Wichita County Auxiliary* at a dinner meeting January 12 in Wichita Falls. Dr. Bailey R. Collins spoke on "The World Beautiful," illustrating his speech with pictures made during his travels.

Mrs. J. W. Ward spoke on "Medical Legislation" at the January 2 meeting of *Hunt-Rockwall-Rains-Delta Counties Auxiliary* in the home of Dr. and Mrs. S. D. Whitten, Greenville.

Galveston County Auxiliary met January 19 for a business meeting and luncheon. Mrs. John Otto was chairman.

Plans for a tea with proceeds going to the Heart Fund Drive were made at the meeting of *Brown-Comanche-Mills-San Saba Counties Auxiliary* January 12 at the home of Dr. and Mrs. Ernest F. Cadenhead, Brownwood. A film, "How to Catch a Cold," was shown.

Mrs. Ellis McInnis, representing the American Cancer Society, spoke about the necessity for a yearly physical check-up to members of *Taylor-Jones Counties Auxiliary* at the home of Dr. and Mrs. Earl R. Cockrell, Abilene. Officers elected were Mrs. Virgil A. Pate, Jr., president, and Mrs. J. M. Hooks, Jr., president-elect.

Camp-Morris-Titus Counties Auxiliary met January 27 in the home of Dr. and Mrs. R. L. Johnson, Pittsburg, for a business meeting and film, "Good Mental Health." Mrs. William A. Taylor was elected president of the auxiliary at the meeting.

Smith County Auxiliary met February 3 in the home of Dr. and Mrs. S. W. Bradford, Tyler, and heard Mrs. Thomas J. Jarmon discuss state schools for the deaf, blind, and feeble-minded.

Mrs. Haskell D. Hatfield was elected president of the *El Paso County Auxiliary* and Mrs. W. W. Schuessler, president-elect at the March 8 meeting honoring past presidents. The program included a speech by Dr. John Sharp, Texas Western University, on the go-back-to-church movement and a book review, "Dr. Pygmalion," by Mrs. James Gorman. El Paso County Auxiliary is sponsoring a course in nursing and first aid on television.

A luncheon in Denison honoring Mrs. E. W. Coyle, San Antonio, State Auxiliary President, was given by *Grayson County Auxiliary* January 8. Other honored guests were Mrs. Frank Haggard, San Antonio, Past President of State, Southern, and National Auxiliaries; Mrs. O. W. Robinson, Paris, Past State President; Mrs. John Glecker, Denison, First Vice-President of the State Auxiliary; and Mrs. Emmett Essin, Sherman, president-elect of the Fourteenth District. At the Grayson County Auxiliary's February meeting, held in the home of Mrs. Jack McGhee, Sherman, a film on "The Effects of the Atomic Bomb" was shown.

DISTRICT AUXILIARIES

First District Auxiliary

New officers of the Woman's Auxiliary to the First District Medical Society were elected at the February 12 meeting in Pecos. Mrs. A. J. Eck, El Paso, was elected president; Mrs. Hugh Martin, Pecos, vice-president; and Mrs. Charles E. Oswalt, Jr., Fort Stockton, secretary-treasurer. Special guests were Mrs. E. W. Coyle, San Antonio, State President, and Mrs. George Turner, El Paso, National President-Elect.

Twelfth District Auxiliary

The Woman's Auxiliary to the Twelfth District Medical Society met in Waco January 12, with Mrs. Milton Spark, president, presiding over the business session. The slate of officers submitted by the nominating committee was unanimously elected as follows: Mrs. G. V. Brindley, Jr., Temple, president; Mrs. E. B. Fine, Waco, vice-president; Mrs. S. J. Barron, Corsicana, secretary-treasurer; and Mrs. C. R. Miller, Ward, reporter.

A memorial offering was contributed in memory of Dr. O. C. Bowmer and Dr. J. E. McClung, Corsicana; Dr. V. M. Longmire, Temple; and Dr. Howard Dudgeon, Sr., Waco.

The auxiliary joined the society for a luncheon, at which Dr. F. J. L. Blasingame, Wharton, President-Elect of the Texas Medical Association, was guest speaker. His address was "Can Private Practice Survive?"

Those serving on the nominating committee were Mrs. S. H. Burnett, Corsicana; Mrs. F. F. Kirby, Waco; and Mrs. J. H. Johnson, Temple.—Mrs. C. L. Gary, Jr., Corsicana.

Mrs. E. W. Coyle, San Antonio, State Auxiliary President, who spoke on "The Doctor's Wife in Public Service," was a guest at the *Dallas County Auxiliary* meeting February 2. Also honored were Mrs. James Atchison, president of the Woman's Auxiliary to the Fourteenth District Medical Society, and county presidents of District 14.

DEATHS

J. M. JACKSON

Dr. Jacob Marcus Jackson, Port Arthur, Texas, died December 17, 1953, of diabetes, uremia, and hypertensive heart disease. He had suffered a stroke about a year ago, and recently had returned to Port Arthur from a hospital in Louisiana.

Dr. Jackson was born December 6, 1892, at Ratcliff near Crockett and attended Ratcliff public schools before being graduated in 1917 from the University of Tennessee College of Medicine, Memphis. He practiced at Ratcliff for one year, Lufkin for three years, and Port Arthur for more than thirty years. Dr. Jackson maintained an office in Port Arthur, but had not practiced recently because of ill health.

A member of the American Medical Association and Texas Medical Association through Jefferson County Medical Society, Dr. Jackson previously had belonged to Angelina County society, and had been a member of the Phi Chi medical fraternity. He belonged to the Elks Club and the Baptist Church.

Survivors include two daughters, Mrs. Virginia Reese, Houston, and Mrs. Lillian Cooper, Lufkin; a son, John Marcus Jackson, Austin; two sisters, Mrs. Jewel Mackey, Wharton, and Mrs. Claire Logston, Houston; and three grandsons.

C. M. HENDRICKS

Dr. Charles McChristie Hendricks, El Paso, Texas, died December 9, 1953, of cancer.

Dr. Hendricks was born December 5, 1878, in Gratis, Ohio, the son of Dallas C. and Elenora (McChristie) Hendricks. He attended Gratis schools and Miami University, Oxford, Ohio. He was graduated from Medical College of the University of Ohio, Cincinnati, Ohio, in 1905. He interned at National Jewish Hospital in Denver.

An honorary member of the Texas Medical Association since 1952 and a member almost continuously since 1908, Dr. Hendricks was past president of the El Paso County Medical Society and served as chairman of the Committee on Tuberculosis of the Texas Medical Association. He also belonged to the American Medical Association. Dr. Hendricks was past president of the American College of Chest Physicians, and he was awarded its medal for furthering progress in the field of diseases of the chest in 1948. He was a member of the American Trudeau Society, an honorary life member of the Pan American Medical Association, a member of the United States Committee of World Medical Association, director of Research and Education Council of College of Chest Physicians, and executive director of the Common Cold Foundation. He was first editor of *Diseases of the Chest.* He was former medical director of Baldwin and El Paso Sanatoriums and Hendricks-Laws Sanatorium, which he founded. Dr. Hendricks had practiced medicine in El Paso for forty-six years.

Dr. Hendricks was a member of Phi Delta Theta fraternity and the Sons of the American Revolution. He was a charter member of El Paso Rotary Club, an honorary member of Kiwanis, a member of the Masonic Order, past chairman of the American Red Cross in El Paso, and past president of the Gate Way Club. Dr. Hendricks was a member of the Presbyterian Church. He was one of the founders of the Sun Carnival Association.

A colonel in the United States Army Reserve Medical Corps, Dr. Hendricks served during World War I as a lieutenant colonel with the Ninetieth Regiment in San Antonio, Europe, and the Army of Occupation in Germany.

Dr. Hendricks was married to Miss Edith Louise Duguid in Toledo, Ohio, in June, 1905. She survives, as do four daughters, Mrs. James M. Campbell, Jr., Burbank, Calif.; Mrs. George N. Broderson, Jr., El Paso; Mrs. Don B. Thurman, Havana, Cuba; and Mrs. Charles H. Caldwell, Dallas; and three sisters, Mrs. Fred Clawson, Glendale, Calif.; Mrs. H. S. Ebbinghouse, Richmond, Ind.; and Mrs. D. P. Swain, Columbus, Ohio.

M. A. RAMSDELL

Dr. Marshall Albert Ramsdell, San Antonio, died February 22, 1954, in a local hospital of acute leukemia.

Dr. Ramsdell was born in Salado April 4, 1887, the son of Charles Henry and Augusta (Halley) Ramsdell. He was educated in the Salado and Austin public schools; the University of Texas, Austin; and the University of Texas School

DR. MARSHALL A. RAMSDELL

of Medicine, Galveston, from which he was graduated in 1916. Dr. Ramsdell served an internship at John Sealy Hospital, Galveston, and practiced medicine in Santa Anna and Eagle Pass before settling in San Antonio in 1926. He did general practice until moving to San Antonio, when he began specializing in pediatrics. He did postgraduate work at Barnes Children's Hospital, St. Louis.

A member of the American Medical Association and the Texas Medical Association through Bexar County Medical Society, Dr. Ramsdell was also a member of the local and Texas Pediatric Societies. He formerly had been president of the Coleman County Medical Society and secretary of the Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala Counties Society.

An obituary ordinarily will not be published more than four months after date of death. Cooperation in reporting deaths of physicians and in furnishing appropriate biographical material promptly is solicited.

A member of Phi Chi medical fraternity, Dr. Ramsdell helped to found the San Antonio Blood Bank. He served as secretary and director of the local Kiwanis Club, was a Mason, served as director of the Oak Hills Country Club, and was a member of the Central Christian Church. In 1911 he was captain of the University of Texas football team and was chosen All-Southwest Conference tackle the same year. He was well known as a local amateur golfer. Dr. Ramsdell was a captain in the Army Medical Corps in World War I.

He married the former Miss Evelyn Lenz February 7, 1917, in Galveston. Surviving Dr. Ramsdell are his wife; a daughter, Mrs. G. J. Laughead, San Antonio; a son, W. H. Ramsdell, Houston; a sister, Mrs. R. L. Adamson, Glendale, Calif.; and a brother, R. L. Ramsdell, Havertown, Pa.

L. T. WALLER

Dr. LeRoy T. Waller, Commerce, Texas, died December 16, 1953, at his home of coronary occlusion.

The son of Monroe and Allie (Hanson) Waller, Dr. Waller was born October 15, 1875, in Grayson County. He attended Nashville Medical College, Nashville, Tenn., and was graduated from Louisville Medical College, Louisville, Ky., in 1906. Beginning his practice in Sarepta, La., Dr. Waller moved to Paoli, Okla., in 1911. He practiced in Pickton from 1914 until he moved to Commerce in 1935. At the time of his death he was city health officer of Commerce.

Dr. Waller, a member of the Texas Medical Association through Hunt-Rockwall-Raines-Delta Counties Medical Society, was a Mason and a member of the Methodist Church. He was surgeon for Missouri-Kansas-Texas Railroad and for Cotton Belt Railroads for many years.

DR. LEROY T. WALLER

Dr. Waller was married to Miss Mittie Ann Crow near Homer, La., May 7, 1899. She survives, as do a daughter, Mrs. Howard Miller, Brownsville; four sons, Martin M. Waller, Dallas; Dr. Alvin L. Waller, Brownwood; Ray L. Waller, Corsicana; and J. D. Waller, Malakoff; two sisters, Mrs. W. W. Dean, Minden, La., and Mrs. Ed New, Alexandria, La.; two brothers, Jessie D. Waller, Sarepta, and Reed R. Waller, Tulia; and five grandchildren. The youngest son, Louis Waller, was killed in the New London school explosion in March, 1937.

J. A. SEAY

Dr. Joseph Amsa Seay, Wichita Falls, Texas, died January 28, 1954, at his home of a heart attack. He had been in retirement and a semi-invalid since suffering a stroke in 1946.

Born in Fountain Run, Ky., on March 13, 1879, the son of Joseph A. and Sally (Childress) Seay, he moved with his parents to Bonham when he was quite young. He attended school in Bonham and Fort Worth and was graduated in 1904 from the Kentucky School of Medicine, Louisville, which later merged with the University of Louisville School of Medicine. Dr. Seay did postgraduate work in New York City in proctology, the field in which he specialized during the latter years of his career. He began practicing in the Indian Territory and practiced in Clarksville from 1909 to 1921, when he moved to Wichita Falls.

DR. JOE A. SEAY

An honorary member of the Texas Medical Association since 1949, he had been a member of Wichita County Medical Society almost continuously since 1926. He was a member of the Baptist Church. Dr. Seay was an ardent sportsman and loved the out-of-doors.

He married the former Miss Gladys Wave Paup on September 4, 1929. She survives, as do a daughter, Mrs. Jack Roberts, Jr., Crowell, and a sister, Mrs. Virgie Cowart, Whitewright.

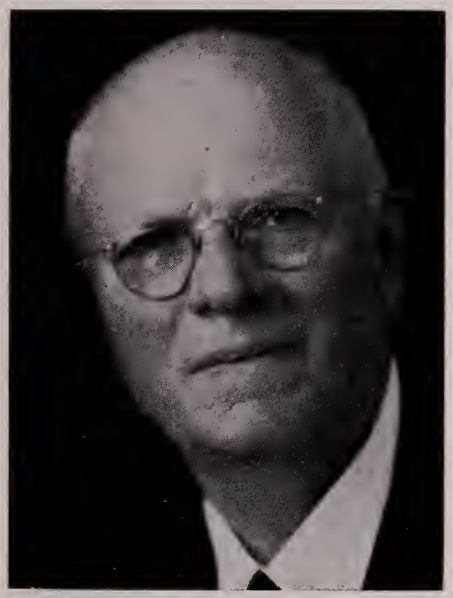
C. H. RULFS

Dr. Carl Henry Rulfs, San Augustine, Texas, died January 11, 1954, at a local hospital from the results of a stroke suffered the preceding November.

Born September 26, 1878, in Wurtemberg, Germany, the son of D. and Johanna (Boschen) Rulfs, he moved to this country with his parents in 1880, settling in Nacogdoches County. He attended the Nacogdoches public schools and Barnes Medical College, Saint Louis, and was graduated from the Tulane University School of Medicine, New Orleans, in 1905. Dr. Rulfs began practicing in Nacog-

doches in 1906 and moved to Lufkin in 1908 to be company physician for Evan's Lumber Mill. Following this, he was company physician for Long-Bell Lumber Company for fifteen years. He moved to San Augustine and practiced there from 1923 until his death, at one time serving as both city and county health officer. Dr. Rulfs retired in 1942, but because of a shortage of doctors during World War II, he began practicing again shortly after his retirement.

An honorary member of the Texas Medical Association since 1952, Dr. Rulfs had been a member of Nacogdoches County Medical Society continuously since 1938. He was a member of the American Medical Association, the Association of American Physicians and Surgeons, and the Southern Medical Association. He was a Mason, being a Knight Templar, and a senior warden of Christ Episcopal Church in San Augustine. Dr. Rulfs served during the Spanish American War as a private with the Second Texas Infantry Division.



DR. C. H. RULFS

He was married to the former Miss Anna Taylor of Nacogdoches, granddaughter of one of the signers of the Texas Declaration of Independence, on January 30, 1907. She survives; as do three sons, Carl Henry Rulfs, Jr., Lamar, Mo.; Lawrence D. Rulfs, San Augustine; and Dietrich Rulfs, Nacogdoches; a daughter, Mrs. Anna Kathryn Holbrook, San Augustine; a brother, John Rulfs, Arlington; and three grandchildren. One son, Milam Irion Rulfs, was killed in 1943 while serving with the United States Marine Corps.

J. R. NICHOLS

Dr. James Routte Nichols, Austin, Texas, died March 2, 1954, of coronary occlusion in a local hospital.

Born in Bastrop, July 26, 1870, the son of James Robert and Josephine Frances (Garth) Nichols, Dr. Nichols attended Sarah Jane Orgain School in Bastrop and public school in Giddings. He was graduated from Texas Agricultural and Mechanical College in 1889 and from Smith's Commercial College, Lexington, Ky., in 1890. He attended the University of Virginia Department of Medicine, Charlottesville, and was graduated from Tulane University of Louisiana School of Medicine, New Orleans, in 1893. Beginning his practice at Greenville in 1894, Dr. Nichols was Hunt County physician and health officer and local surgeon for the Texas Midland Railroad. He worked for the Terrell State Hospital from 1899 to 1907. He then took postgraduate training in eye, ear, nose, and throat at New York Polyclinic Medical School. Soon after returning to Greenville, he was appointed superintendent of the San Antonio State Hospital in 1909. He moved to Austin in 1911 and practiced there until 1947, when he discontinued the practice of medicine. He served as visiting oculist and aurist to several state hospitals after coming to Austin.

Dr. Nichols was a member of the Texas Medical Association and American Medical Association through Travis County Medical Society, which he had served as president,

DR. JAMES R. NICHOLS

and formerly had been a member of Kaufman, Hunt, and Bexar Counties Societies. In 1953 he was elected to inactive membership in the state organization. He was a member of the Presbyterian Church, Masonic Order, Woodmen of the World, Elks, board of directors of the American National Bank, and board of directors of the Security Trust Company, and a former member of the Rotary Club and the Austin Country Club. Dr. Nichols was deeply interested in politics and considered himself a "brass collar" Democrat.

Dr. Nichols married Miss Annie David Fry December 19, 1894. She died in 1910, and he married Miss Anna Douglass Young May 14, 1923. Dr. Nichols is survived by his wife; four daughters, Mrs. Marvin C. Nichols, Fort Worth, and Mrs. Will E. Watt, Mrs. Ben F. Jones, and Mrs. Jess Ashford, all of Austin; two sons, James Wood Nichols, Coral Gables, Fla., and Douglass Young Nichols, Austin; and a brother, Joseph Francis Nichols, Greenville.

G. W. EDGERTON

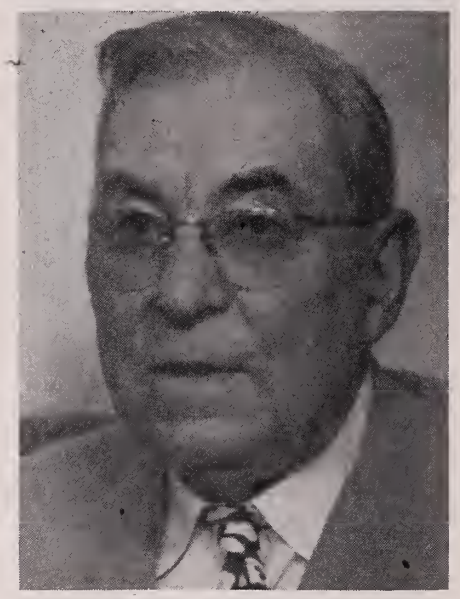
Dr. George W. Edgerton, Corpus Christi, Texas, died January 16, 1954, in a local hospital of congestive heart failure and uremia. He had not been well for several years and had been confined to bed since April.

A native of Plattsmouth, Neb., Dr. Edgerton was born in 1887. He came to Texas as a boy with his parents and finished high school at Sherman, where he also attended

Austin College. He was graduated from the University of Texas, Austin, and the University of Texas School of Medicine, Galveston, receiving his medical degree in 1910. He did postgraduate work at Johns Hopkins University, Baltimore; Mayo Clinic, Rochester, Minn.; Cook County Hospital, Chicago; and in California.

For thirteen years at the start of his medical career he practiced in Rio Grande City. He had patients in Northern Mexico as far away as Monterrey and served as United States health officer along the border during World War I. He practiced in San Benito before moving to Harlingen in 1933. He had lived in Corpus Christi since 1941. Dr. Edgerton was chairman of the Corpus Christi City-County Health Board in 1946 and was instrumental in preventing a threatened poliomyelitis epidemic in that year. He was the first local doctor named to the draft board in Corpus Christi and was a state director of Selective Service.

He was a member of the American Medical Association and Texas Medical Association through Nueces County Medical Society, previously belonging to Grayson, Hidalgo, and Cameron Counties Societies. In 1930 he was president



DR. G. W. EDGERTON

of Cameron County Medical Society. He was a Methodist, Mason, Shriner, and member of the Harlingen Kiwanis Club, serving at one time as its president. He had oil interests near Abilene and in California.

Survivors include his wife, Betty; five children by a former marriage, Mrs. Estrella Raybourn, Harlingen; G. H. Edgerton, Austin; Charles H. Edgerton, New Braunfels; Joe Edgerton, San Antonio; and Robbie H. Edgerton, Corpus Christi; a step-daughter, Mrs. R. O. McCarty, Jr., Grand Isle, La.; and seven grandchildren.

T. N. GOODSON

Dr. Thomas Neavitt Goodson, health officer of Bexar County for twenty years, died January 11, 1954, in Waco, Texas, of coronary thrombosis. Dr. Goodson had been ill since his retirement from the post in San Antonio in 1947.

The son of Greene Herbert and Nora (Neavitt) Goodson, Dr. Goodson was born March 27, 1883, in Hamilton. He was graduated from Texas Christian University, then in Waco, and the University of Texas School of Medicine, Galveston, receiving his degree from the latter institution in 1908. After serving an internship at Santa Rosa Hospital, San Antonio, Dr. Goodson entered private practice in that city. In 1917 he became assistant county health officer, and in the twenties, health officer. He is credited as having set up a permanent, wholesale immunization program in the county schools during his term of office.

A member of Bexar County Medical Society, the Texas Medical Association, and the American Medical Association throughout his career, Dr. Goodson also was a member of the city and county boards of health and of the Christian Church. He saw overseas service in France during World War I and was active in county politics for years.

Dr. Goodson's wife, the former Mrs. Katherine Turner, whom he married in 1911, was killed in an automobile accident March 23, 1953. Several nieces and nephews survive.

J. D. MOTHERAL

Dr. Jefferson Davis Motheral, Katy, Texas, died February 4, 1954, in a Houston hospital.

The son of John and Tennie (Martin) Motheral, Dr. Motheral was born September 29, 1878, near San Marcos, where he attended public school and the old Coronal Institute. He went to Vanderbilt University, Nashville, and received his medical education at the old Hospital College of Medicine, Louisville, Ky., being graduated in 1904. From 1904 until 1911 he practiced in Cotulla; from 1911 until 1913 in Bloomington; and from 1913 to 1917 in Angleton. For the next two years he was in the Army Medical Corps, serving in the European theater and being promoted to the

DR. J. D. MOTHERAL

rank of major. Returning to private practice, Dr. Motheral was in Houston from 1919 to 1939 and in Katy since then. He had retired from active practice in 1951.

A member of Harris County Medical Society and the Texas Medical Association, Dr. Motheral was named to honorary membership in the latter organization in 1951. He was a lifetime member of the Methodist Church, a charter member of the Katy Rotary Club, and a Mason.

Miss Julia E. Howard and Dr. Motheral were married June 12, 1906, in Devine. She survives, as do two sons, J. D. Motheral, Katy, and George E. Motheral, Fort Worth; a daughter, Mrs. Edwin P. Neilan, Wilmington, Del.; a sister, Miss Tennie Motheral, Katy; and four grandchildren.

President's Page

AN INVITATION

I should like to begin my initial monthly message by extending an invitation for greater participation in the affairs of our Association by its members. Every physician has numerous demands on his time; but it is reasonable to expect him to give some of his energy and effort to organized medicine.

Membership in our Association for the past fiscal year was the largest in its history and totalled 6,725; but there continues lack of interest on the part of many member physicians. Attendance at county, district, and state meetings is generally poor. In many quarters, there is apparent lack of understanding of the policies and programs of our Association.

Specialty and general practice groups have formed and meet some professional needs. Hospital staff meetings are numerous and often semicompulsory. Large postgraduate assemblies have developed in three of our large cities and produce attractive programs.

Yet, most thoughtful physicians recognize that our Texas Medical Association is the primary and fundamental part of organized medicine in Texas and the only group through which all physicians can meet and express themselves and help to determine the policies and programs in medical affairs in Texas.

Over 100 years of experience has seasoned our Association. Its central office and staff, its councils, and its committees are set up to be of service in health matters in our state.

While it is primarily a scientific body and must continue ever to be such, our Association, of necessity, must concern itself also in prob-

lems of the socio-economic environment in which medicine is practiced if many of its traditional benefits are to be preserved.

A position of leadership must be maintained by our Association; but it can do so only by increasing its vitality and by increasing its effectiveness through service to our profession and to our citizens.

An Advisory Committee

To this end, I have requested that an Advisory Committee to the President be formed. This committee is composed of the President-Elect, the Vice-President, the Speaker of the House of Delegates, the President of the Woman's Auxiliary, the Chairman of the Board of Trustees, the Chairman of the Board of Councilors, the Chairman of the Council on Scientific Work, Chairman of the Council on Medical Jurisprudence, Chairman of the Council on Medical Economics, Chairman of the Council on Medical Defense, Chairman of the Council on Medical Education and Hospitals, and Chairman of the Committee on Public Relations. The members of this committee have agreed to give of their time and attention to forward the affairs of the Texas Medical Association.

It is my considered opinion that this committee will serve to coordinate the various functions of our Association. Through this committee every part of the Association will know the current problems and the needs of the other portions of the Association. Meetings of this committee will be held as circumstances require. Opportunity for prompt and necessary discussion of problems and policies will make for decision and action, thus implementing the program of our Association. This committee will stand ready to give attention to your constructive suggestions.

Your help is invited.

J. J. L. Bloomfield, M.D.

PR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: The eighty-seventh annual session of the Texas Medical Association, San Antonio, May 3 through 5, presented one of its most interesting sessions to date.

On the PR side of meeting were two able speakers. William Alan Richardson, Medical Economics' editor from Rutherford, N. J., underscored the necessity for and benefits of sound PR programs, on both individual and organizational levels. He pointed out that the seed of public distrust is often unintentionally planted in the busy physician's office. He covered results of this distrust when he assured listeners that the first stop-gap for encroachment of socialization, both business and professional, is favor in the public mind.

Assemblage at the general meeting luncheon heard Roger Fleming, secretary of the American Farm Bureau Federation, Washington, D. C. He warned medics that the favorite technique of those who favor maximum political intervention in the economic field is to try to put those who support the American system of private enterprise on the defensive.

An advisory committee to the President formed and met on last day of meeting. Committee is composed of President-Elect, Vice-President Speaker of House of Delegates, President of Woman's Auxiliary, and chairmen of key boards, councils, and committees. Members' background variety in special interests and geographical areas will afford better coordination in various functions of the Association. Endeavor: to strengthen county and state societies.

Detailed attendance survey of county medical societies, conducted at request of President F. J. L. Blasingame and analyzed by C. Lincoln Williston, new assistant executive secretary, brings to light speculative results, pinpoints weak areas, and provides a starting point from which to develop more interest, better attendance. Results showed higher attendance ratio in societies listing less than ten on their membership rolls.

MAJOR HEALTH LEGISLATION MOVING IN CONGRESS: On a number of health bills, attention will shift shortly from committees to House and Senate floors; the Hill-Burton bill and Public Health Service grants bill already have passed the House.

From questionnaires checking actions by delegates to the AMA House of Delegates, the Iowa State Medical Society has released figures showing that 89 per cent of Iowa doctors approved AMA's stand against treatment of nonservice connected disability cases in Veterans Administration hospitals; 95 per cent favor the Keogh-Jenkins bills, allowing physicians to set aside retirement funds exempt from current taxation; 83.5 per cent agree that more liberal deductions for medical expenses should be made under federal income tax laws.

FROM OVER THE STATE: Tarrant County Medical Society assisted its auxiliary in the production of a variety show, "Tonics and Sedatives," recently. Active cooperation between these allied groups resulted in $600 supplement to the auxiliary's nurse scholarship fund and interesting entertainment for all.

Travis County Medical Society joined forces with local unit of American Cancer Society in day-long presentation of brief educational films on cancer. Doctors were in attendance to answer questions of lay audience. Local firms were asked to allow employees thirty minutes during day to view film facts.

AMA makes this observation on rating of the "Ask Your Doctor" show being televised each Sunday by the Lubbock-Crosby Counties Medical Society over KCBD-TV: says the panel-type program competes with the network's Omnibus production and is currently running a higher audience rating than this stiff competition. Dr. William H. Gordon, Lubbock-Crosby Society's TV committee chairman, sums up the program's PR value by saying: "I think it has done more in the past few weeks to help improve public relations in our community than any other possible project."

Harris County Medical Society joins forces with Houston's Museum of Natural History group in producing two programs for their "Nature in Action" series. In addition, the society is launching its own sequence, "Focus on Health." Program titles prove to be important promotional pegs. "The Biggest Little Pump," "A Tale of Two Teeth," and "TB Need Not To Be" are both eye and ear catching - provide viewer with hint at subject matter.

TIP OF THE MONTH

Building good television relations is as important to a medical society as establishing good press relations. TV contacts pave the way not only for securing public service time for regular shows - - but also for arranging "spot" interviews with outstanding medical men who may visit the community from time to time.

Volume 50 | Austin, Texas, May, 1954 | Number 5

DR. F. J. L. BLASINGAME

Taking office as the eighty-ninth President of the Texas Medical Association, Dr. F. J. L. Blasingame of Wharton on May 5 accepted the gavel of office from his predecessor, Dr. George Turner of El Paso, in the closing moments of the 1954 annual session in San Antonio.

Son of John Mitchell Coleman Blasingame and Lillian Adams White Blasingame, native Texans, Dr. Blasingame was born January 17, 1907, in Hot Springs, Ark., where he lived only two years. He spent the remainder of his childhood in Hempstead, which he considers his "home town." It was there that he received his early education and from there that he went to the University of Texas, Austin, where he was granted a bachelor of arts degree in 1929, and to the University of Texas Medical Branch, Galveston, where he obtained a doctor of medicine degree in 1932.

Dr. Blasingame says that he had a particular attachment to the medical school in Galveston because of circumstances which happened long before his birth. His Grandfather White was killed by lightning while he was herding cattle one day on Galveston Island. His wife, left to provide for herself and her family, moved near the medical school at the other end of the island and opened a boarding house for the faculty and students. Dr. Blasingame's mother, an infant when her father was killed, spent a number of years in the environment of the medical school and came to know many of its staff and students. Later, she and her husband encouraged their son to seek a good education, and these earlier contacts pointed the way to the Medical Branch at Galveston.

Since the time of his graduation from the University of Texas Medical Branch, Dr. Blasingame has maintained active connection with it as a teacher of anatomy. He began with the rank of instructor, became an associate professor, and now holds the title of lecturer. His interest in educational institutions is reflected also in his membership on the Wharton County Junior College board of trustees, which he has chaired since its establishment eight years ago.

Dr. Blasingame served an internship in Henry Ford Hospital, Detroit, and has been engaged in the private practice of medicine at Wharton since August, 1937. He is a senior member of the staff and part owner of the Rugeley and Blasingame Clinic and Hospital, where he does general practice with special interest in surgery.

Dr. Blasingame is nationally known as an earnest and effective participant in professional organizations. He is a member of the Wharton-Jackson-Matagorda-Fort Bend Counties Medical Society, Eighth District Medical Society, Texas Medical Association, American Medical Association, Southern Medical Association, and United States Committee of the World Medical Association. He served as Councilor of the Eighth District from 1941 until his election to the Board of Trustees of the Texas Medical Association in 1947. In 1946 he introduced into the House of Delegates a resolution which eventually led to passage by the Texas Legislature of the minimum standards law which now applies to all Texans practicing a healing art.

In 1949 Dr. Blasingame was elected to the Board of Trustees of the American Medical Association. One of the youngest physicians to hold such an important post with the AMA, he has exerted considerable influence in the promotion of active programs aimed toward providing better health for American people. For almost three years he headed the AMA's Legislative Committee. On a number of occasions he has represented the American Medical Association before committees of the Congress in presenting testimony on proposed legislation affecting health matters. He now is a member of the three-man Executive Committee of the AMA Board, which serves as the Finance Committee and the interim functioning unit for the Trustees. Last year he was one of the AMA representatives at the first World Conference on Medical Education in London and was alternate delegate at the World Medical Association assembly at The Hague.

Dr. Blasingame is a fellow of the American College of Surgeons; president of the board of trustees of the Blue Cross and Blue Shield plans in Texas; and a member of Phi Chi medical fraternity and Alpha Omega Alpha honorary medical fraternity. He is an active member of the Episcopal Church, a member of the Masonic Order including the Scottish Rite and Shrine, and a member of Wharton Country Club.

An able speaker, Dr. Blasingame has found time to publish articles in state and national publications, his topics ranging from technical medical subjects to discussion of current socio-economic problems.

Dr. Blasingame's wife, the former Miss Dorothy Isbel Rugeley of Wichita Falls, whom he married June 8, 1932, in Austin, has shared her husband's interest in the medical profession. A member of the Woman's Auxiliary to the county and state medical organizations, Mrs. Blasingame has held various official positions including that of district council woman. The Blasingames have five children, Mary Lillian, Betty Nan, John Chester, Rebecca Louise, and James Edward. Dr. Blasingame's mother lives in Hempstead. He has one brother, John Gray Blasingame of Los Angeles.

A vigorous man imbued with enthusiasm for his profession and engrained with the ideals which have made America great, "Bing" Blasingame, as his friends affectionately call him, did not wait until the mantle of the presidency fell about his shoulders before considering the job seriously. He spent much of his year as President-Elect conferring with members of the Association and its staff to determine wherein weakness lay and through what means the program of the Texas Medical Association might be strengthened and made more effective during his administration. He has extended a hearty invitation to his colleagues to

work with him in the next twelve months to further the goals of the Association and to spread the base of participation not only in the state organization, but also in the county society. Anyone with the energy, the vision, and the talent that Dr. Blasingame has cannot fail if the cooperation which his program deserves is forthcoming.

AT SAN ANTONIO

San Antonio seemed to be full of doctors and doctors' wives the first week in May when the Texas Medical Association and the Woman's Auxiliary held their annual conventions. The consensus was that the meetings ran smoothly, that the hosts and hostesses were gracious and adept at their tasks, and that a good time was had by almost all. Details of the meetings will appear in the June and July issues of the JOURNAL.

The business sessions of the House of Delegates of the Association were singularly free of controversy. A proposal introduced a year ago to increase the number of Trustees and to elect them from geographical districts was defeated, but approval was given to the elimination of dues for honorary, inactive, and military members. Several Constitutional amendments pertaining to membership were introduced for final action next year. The House approved the stand of the American Medical Association relative to care of veterans and adopted a resolution recommending that further steps toward cooperation and amalgamation with doctors of osteopathy be delayed until the osteopaths express greater interest in such a move. The House also took a stand against further expansion of social security on a compulsory basis. A special committee to make a study of maternal mortality was authorized.

Naming Dr. A. L. Thomas of Ennis as General Practitioner of the Year, the House of Delegates elected a full slate of officers and council members by acclamation. Dr. J. L. Cochran, San Antonio, formerly Councilor of the Fifth District, was chosen President-Elect; Dr. J. C. Terrell, Stephenville, Vice-President; and Dr. Troy A. Shafer, Harlingen, Trustee. Dr. F. J. L. Blasingame, Wharton, took office as President, succeeding Dr. George Turner of El Paso.

The Woman's Auxiliary named Mrs. Joseph H. McCracken, Jr., of Dallas as President-Elect. Mrs. Mark H. Latimer, Houston, is the new President, filling the post held last year by Mrs. Edward W. Coyle of San Antonio. Mrs. George Turner, El Paso, a former president of the State Auxiliary and now President-Elect of the Woman's Auxiliary to the American Medical Association, and Mrs. Sam Thompson, Kerrville, a past president of the State Auxiliary and, with Dr. Thompson, a generous donor to the Library of the Texas Medical Association, were made honorary life presidents. Special tribute was paid at a luncheon meeting to Mrs. E. H. Cary of Dallas, first president of the State Auxiliary; Mrs. Cary was unable to be present, but sent a letter to the membership. The Auxiliary adopted extensive revisions in its Constitution aimed at providing a more effective organizational framework and voted to hold Executive Board meetings each fall in Austin.

Special guests of the Association and Auxiliary included Dr. Simeon T. Cantril, Seattle; Dr. George T. Harrell, Jr., Gainesville, Fla.; Dr. Harold D. Palmer, Denver; Dr. E. Stewart Taylor, Denver; Roger Fleming, Washington, D. C.; William Alan Richardson, Rutherford, N. J.; and Mrs. George D. Feldner, New Orleans. Two other guests were unable to be present, Dr. Robert L. Sanders, Memphis, Tenn., because of his own illness and Mrs. Leo J. Schaefer, Salina, Kan., because of her husband's illness. Other out-of-state speakers were featured on the programs of the more than a dozen specialty societies which met in San Antonio in conjunction with the annual session of the Texas Medical Association.

A departure from traditional entertainments honoring the Association's President, the buffet and party held in the patio at La Villita the evening of May 4 attracted well over 400 persons, all of whom seemed to enjoy the bountiful food and drink and the Mexican-flavored floor show despite unseasonably cool weather which had the women reaching for wraps.

Final registration figures gave a total of 2,114, of which 1,209 registrants were members, 6 guests, 180 visitors and students, 182 exhibitors, and 537 Woman's Auxiliary members and guests.

Plans already are under way for the 1955 annual session, which will be held in Fort Worth, April 25, 26, and 27. The invitation of Galveston County Medical Society for 1956 was accepted; dates have not been set yet.

CURRENT EDITORIAL COMMENT

INDISCRIMINATE USE OF CORTISONE IN OPHTHALMOLOGY

While the internist has become weary of the indefinite results of cortisone in arthritis, the ophthalmologist has found more and more uses for the drug. In the treatment of acute iritis, acute choroiditis, vernal catarrh, phlyctenular keratitis, some types of marginal ulcers of the cornea, reduction of scar formation in late wound healing, and collagen diseases, cortisone is effective. Inevitably, such a beneficial drug often will be used in diseases where it can do no good, and to use cortisone in such a fashion is to invite disaster.

Clinicians and research workers have emphasized repeatedly that cortisone is not an antibiotic. Although bacterial infection responds dramatically to cortisone, which blocks the inflammatory reaction, it should be remembered that cortisone does not attack the cause of the disease, and symptomatic control should not lull the physician into a false sense of security.[12] Early workers had the feeling that cortisone was an addition to the body defense, that it brought forth added defensive mechanisms that helped to fight disease. This concept has changed, and it is now believed that what cortisone actually does is to block the inflammatory and exudative phases of allergic reaction, as well as nonallergic reaction.[11] Because of this blocking of the inflammatory reaction, the patient is not annoyed by the toxins of his infection and will scarcely know he is sick.[2]

Probably the most insidious part of the improper use of cortisone in ophthalmology is the soothing effect it has upon the eye and the fact that objectively the eye appears to be healing well. One can administer cortisone to a patient with panophthalmitis, and while the eyeball progresses to a bag of virulent pus, it will scarcely look inflamed. Or one can commence to use cortisone immediately after an operation, and with the eye appearing white and uninfected, bacterial invasion may progress to a point at which the eye is hopelessly lost.

In cases of corneal grafts, cortisone has proved of great value in the secondary stages of healing to prevent blood vessel and scar formation,[7] and in other cases of corneal scarring, cortisone will lessen the scar, but it must be used in the secondary stages of healing and not while fibrin is forming. Healing is delayed unduly if cortisone is administered too soon.[10] One should not be confused by the fact that a wound often will heal when cortisone is given, say, three times daily. Such infrequent use is not always sufficient to prevent healing. Cortisone, to be really effective, should be used every hour or two.

Perhaps in no other condition has the misuse of cortisone been more disastrous than in the treatment of virus diseases of the eye. Vari-

This department of the JOURNAL *presents editorial comments on current items pertaining to the science, art, and practice of medicine, contributed by members of the Texas Medical Association and scientists closely associated with the medical profession of Texas. Invitation is hereby extended to any member of the Texas Medical Association to submit such discussions for this department. The discussions should not be more than 500 words in length.*

ous researchers[5, 8] have observed no or poor results from cortisone in virus conditions. Thygeson, Hogan, and Kimura cited 4 cases, including 1 of their own, in which herpes zoster resulted in corneal perforations following the use of cortisone.[9] Adult mice ordinarily immune to coxsackie virus infection may be lethally infected if first given cortisone,[6] and cortisone applied to the cornea when a dendritic ulcer begins will spread the lesion to the entire cornea.[3, 4] Allen reported disastrous results in 3 cases of dendritic ulcer treated with cortisone.[1] I have observed in 2 cases of dendritic ulcer treated with cortisone the development of ring keratitis and cloudiness of the cornea with eventual vision in 1 patient of only 20/60 and in the other of only light perception, the poor results probably caused by the use of cortisone.

Because of its wide field of usefulness and its tendency to relieve pain and soreness, cortisone has come to be used in an indiscriminate fashion in ophthalmology. It is not an antibiotic but may give a false sense of security. It will prevent excessive vascularization and scar formation, but will delay wound healing if used too soon. It is deleterious to virus disease. Care must be taken in the choice of cases and in the method of administration of cortisone to prevent serious visual loss from its misuse.

GAMMA GLOBULIN

The Department of Health, Education, and Welfare has announced plans for the distribution of gamma globulin for use against poliomyelitis during the coming season. Poliomyelitis gamma globulin is being kept and issued separately from the gamma globulin furnished for the prophylaxis of measles and infectious hepatitis.

Forty-five per cent of the supply of gamma globulin available for the prophylaxis of poliomyelitis will be set aside in accordance with each state's proportionate share of the national aggregate number of reported poliomyelitis cases during the five year period from 1949 to 1953; 45 per cent of the supply will be set aside in accordance with each state's proportionate share of the total population under the age of 15 years in counties which had annual crude poliomyelitis attack rates at least four times the national poliomyelitis crude attack rate during any of the years 1949 to 1953; and 10 per cent will be held as a contingency reserve for issuance to state and territorial health officers on special request.

The first allotment of gamma globulin for use against poliomyelitis became available to all state health departments on April 7, and the second allotment will be ready for distribution on or about June 1. State health departments have been instructed to submit requests for gamma globulin for use against poliomyelitis to the Division of Civilian Health Requirements, Public Health Service, Department of Health, Education, and Welfare, Washington 25, D. C.

CORRECTION

At the time the Current Editorial Comment, "A Challenge to Leadership in Mental Health," appeared in the April, 1954, issue of the JOURNAL (pages 208-209) the author, Dr. Don P. Morris, was professor of psychiatry and mental health at the University of Illinois, Urbana. Dr. Morris formerly was professor of neuropsychiatry at Southwestern Medical School of the University of Texas, Dallas, and will be in private practice in Dallas within the next few weeks.

Committee to Study Subsidy of Education

William V. Houston, Ph. D., president of Rice Institute, Houston, is one of thirteen members of an advisory committee appointed by the National Science Foundation, Washington, D. C., to consider the effects of government support to colleges and universities on their research and teaching functions, *The Journal of the American Medical Association* reports. According to the foundation, 225 educational institutions received some federal support for development and research in the year 1951-1952. In the year ending June 30, 1952, educational institutions received almost $300,000,000 from federal agencies for development and research.

ORIGINAL ARTICLES

IS DEAFNESS GOING UNRECOGNIZED?

WAYMAN B. NORMAN, M. D., Longview, Texas

THIS provocative title is not meant to condemn but to call attention to the fact that all of us are guilty of the sin of neglect and thereby share responsibility for many partially deaf children each year. How can this be possible? We simply fail to recognize serous otitis media. This is one of the most frequently and unfortunately missed diagnoses in otolaryngology today.

Synonyms are numerous because of etiologic confusion—acute catarrhal otitis media, tubotympanitis, eustachian salpingitis, otitis media with effusion, tubotympanal catarrh, tympanic hydrops, secretory otitis media, serous otitis media, and fluid ear. The two terms otitis media with effusion and serous otitis media are more apropos than secretory otitis because in many cases surely there is a transudation of fluid rather than an actual secretion. Perhaps when the real cause of the many different types of this disease is found, we will have several etiologic names.

Historically speaking, Adam Politzer deserves the credit for first accurately describing this condition in 1869;[6] however, if the truth were known, it might well be that Sir Astly Cooper actually was employing one of our modern methods of treatment in 1802, when he described paracentesis as a successful method of relieving deafness due to eustachian tube obstruction. It is interesting to note that paracentesis of the drum head was being employed to relieve deafness before myringotomy was used for infectious ears.[9]

Anatomically, the eustachian tube, tympanic cavity, attic, antrum, and mastoid cells are entodermal derivatives of the first pharyngeal pouch.[11] The eustachian tube in the adult is 35 mm. long with an outer bony part of 10 mm. and an inner cartilaginous part of 25 mm.[1] The mucous membrane of the middle ear is of the low cuboidal type and no goblet cells are present, whereas the eustachian tube is lined by columnar ciliated epithelium which reveals many goblet cells in the cartilaginous part.[2]

In physiologic function, the eustachian tube acts as a flutter valve for the middle ear; that is, if pressure changes take place, the air can exit from the cavity much easier than it can enter.

Read before the Dallas Academy of Ophthalmology and Otolaryngology, June, 1953.

The following is an attempt at an etiologic classication:[7, 8]

I. Eustachian tube obstruction.
  A. Lymphoid tissue in the nasopharynx.
  B. Enlargement of peritubal lymph nodes.
  C. Eustachian tube obstruction due to vasomotor imbalance involving the nose and nasopharynx.
    1. Allergy.
    2. Hypothyroidism.
    3. Menopausal vasomotor rhinitis.
    4. Pregnancy.
    5. Psychogenic vasomotor rhinitis.[3]
  D. All infection of upper respiratory tract.
    1. Acute.
    2. Chronic with superimposed sinusitis.
  E. Dental malocclusion.
  F. Carcinoma of nasopharynx.
II. Barotrauma.
III. General hydropic states such as severe renal disease and cardiac failure.
IV. Postantibiotic deafness.

DIAGNOSIS

The symptomatology of serous otitis media is typical. Indeed, the patient usually will make the diagnosis for the alert physician by making the following common statement:

"When I speak, it seems as if my head is in a barrel or in a well; I hear my own voice. There is a roar in one of my ears and a deafness. I feel numb all over one side of my head. My condition came on suddenly; one day I was normal and the next day I was deaf. I can hear normally when I first get out of bed in the morning but very soon thereafter my hearing leaves me."[10]

Needless to say, if the condition is bilateral, the patient is in a state of depression regarding his hearing, and as in any other partial conductive deafness he hears better in a noisy place than in a quiet one. Frequently he reports that the condition came on a few days after a severe infection of the upper respiratory tract.

The physical examination is extremely revealing, especially in the unilateral case. Brief tuning fork examination reveals a partial conductive deafness in the affected ear; the Weber test lateralizes strongly to the affected ear. The Schwabach reaction is prolonged and the Rinne test is negative. The appearance of the drum head is typical, and I prefer to use reflected light to get a better differentiation in the color of the two drums. The normal ear drum has the usual bluish white appearance, whereas the

affected ear reveals a variation from yellow to amber; occasionally a deep bluish tint is present. Hoople has called attention to the chalk whiteness of the handle of the malleus and the sharp prominence of its lateral process.[4] This difference in appearance is well illustrated by T. E. Walsh, who compared the appearance of the handle of the malleus in a normal ear to a piece of cigarette paper lying over a match on top of a table and in a fluid ear to a cigarette paper lying over a match floating over a surface of water, thus causing a close adherence of the paper to the match.[12] These are the findings in a physical examination if the ear is completely filled with fluid. Of course if there is a meniscus or an obvious bubble, the diagnosis practically leaps out at the observer.

Occasionally in a bilateral case the patient has the symptoms; however, the drums are so thickened either by previous disease or by calcium deposits that the observer is doubtful as to whether or not fluid is present. Hoople[4] advocated auscultation to ascertain the presence of fluid, but I have never found this to be necessary. A small paracentesis is relatively painless, entirely safe, and absolutely conclusive. Indeed if one decides by auscultation that fluid is present, he probably will do a paracentesis anyway; therefore, I believe that I will not be strongly criticized for making the dogmatic statement that it is safe in certain selected difficult cases to do an exploratory paracentesis to ascertain whether or not the fluid is present.

As a general rule the audiometer findings are that of a flat curve between 25 and 30 decibels down. After removal of the fluid the curve rises to within 5 to 10 decibels of the normal, and within two weeks, if no trouble ensues, the hearing is absolutely normal.

Roentgen-ray findings are interesting in that almost all of these cases definitely show mastoid haziness[5] and in the cases following upper respiratory conditions the maxillary sinus reveals clouding on the same side.

TREATMENT

The most gratifying thing about serous otitis is the remarkable immediate relief the patient gets when the fluid is removed from the ear. Therefore, the removal of the fluid by any method is of primary importance. To accomplish this removal, I make a paracentesis of approximately ⅛ inch in length in the postero-inferior part of the drum head near the annulus. The puncture can be made in one quick movement with a small bayonet knife.

Local anesthesia of the drum can be attempted with Bonain's solution or with Pontocaine Hydrochloride; however, the paracentesis is not painful and most physicians do not attempt local anesthesia. If there is definite evidence of an external otitis, it is best to postpone paracentesis until the ear is clean. After the paracentesis is made, it is wise to apply gentle pressure back and forth with a Siegle otoscope to tell definitely whether or not fluid is present. A needle and syringe are used by some physicians, but in my hands this has been more painful.

As a general rule there are two specific types of fluid encountered, one is a thin, rather oily, yellowish fluid and the other is thick, mucoid, and tenacious. Amazing amounts of the thin type fluid sometimes are found and can be removed easily by placing a large pledget of cotton against the paracentesis opening and applying negative pressure to the external auditory canal with the Siegle otoscope. Several large pledgets of cotton may be saturated completely by the fluid. Surely all otolaryngologists have experienced the actual removal at one time of larger amounts of fluid than possibly could be held in the middle ear cavity alone, thus indicating that some mastoid cells have been emptied. If the fluid is found to be of the thick, tenacious type, spot suction is almost always necessary to be certain that complete evacuation of the ear has been achieved.

The dramatic moment is over; the patient is hearing, his roar has stopped, the hollow sound in his head has stopped, and he is agreeably amazed, as is the physician, at the relief obtained. Now is the real testing time when the cause must be found. For this I go back to the original classification and examine the nasopharynx for lymphoid tissue, which is removed either by adenoidectomy or by irradiation. In adults the search is made for vasomotor obstruction of the eustachian tube including allergy, hypothyroidism, menopause syndrome, and pregnancy. The psychogenic diagnosis is made after repeated attacks that are definitely associated with emotional trauma after all other examination is negative. In stubborn cases frequently one maxillary sinus is full of pus and the removal of it is the answer to the problem. The temporomandibular joint syndrome occasionally is found, and of course the physician must be ever alert for the fossa of Rosenmüller cancer. As was learned in World War II, many dive bomber pilots suffered severe barotrauma because of retained lymphoid tissue in the nasopharynx, and this condition responded nicely to irradiation. Of course if the patient is ill enough to have some general hydropic state, it will be obvious.

The otolaryngologist's real opportunity to be of help is when the patient is a child. In preantibiotic days if a child had otitis media, the drum was opened and he was watched carefully. However, today a drum head seldom is opened. When otitis media is diagnosed early, an antibiotic is given and the child is not seen again. In many unfortunate cases the in-

fection is conquered but fluid remains in the middle ear. Occasionally parents notice the child's difficulty in hearing; indeed, I have seen children given penicillin repeatedly to clear up the hearing loss. These cases are usually bilateral.

The main causes of the disease in children are large adenoids, regrowth of adenoids, and allergy, or a combination.

One has to go largely by his own experience in examining these children's ears to ascertain whether or not fluid is present. If there is absolutely no indication that anything should be done surgically in the nasopharynx, the child briefly should be put under an anesthetic and the fluid removed, just as in the adult. This procedure should be repeated as often as necessary, always bearing in mind that the fluid must not be left in the middle ear because in certain cases it will thicken and adhesive deafness will develop. In many cases repetitious or original adenoid surgery can and must be performed. Many types of well made palate retractors and adenoid curets have been fashioned to facilitate better cleaning of the adenoid area. After the definite mechanical block is removed, allergy should be ruled out and treatment rendered as indicated. Here again irradiation is a great ally in cases that do not respond to surgery alone.

CASE REPORTS

Four brief cases are cited to illustrate different types of cases.

CASE 1.—Mrs. G. A. W., a 47 year old white woman, had a history of right sided deafness for three months following influenza. All symptoms and signs pointed toward serous otitis media. Roentgenograms revealed clouding in both mastoid and sinus on the right side. Hearing returned to normal after one paracentesis, but the ear refilled in one week. Another paracentesis and removal of fluid was performed and in addition pus was washed out of the right antrum. No more fluid reformed in the ear.

CASE 2.—Mrs. B. C., a 52 year old white woman, had a history of bilateral deafness five days after hay fever season started in August, 1951. Allergy treatment without paracentesis was to no avail. Paracentesis was performed. Allergy treatment continued and the fluid did not reform. This patient repeated the same cycle in August, 1952. She was desensitized in 1953 in preparation for the hay fever season.

CASE 3.—Mrs. B. C. D., a 48 year old white woman, represents the psychogenic type of serous otitis media. The husband of this patient has a recurrent type of heart disease and has had three major attacks. Approximately one week after each attack the patient has become deaf. Only one paracentesis and adequate medications with Tolserol have been effective in relieving her attacks. There are no positive physical findings otherwise.

CASE 4.—B. W., a white boy with a history of tonsillectomy and adenoidectomy at the age of 3, did well until January of his eighth year, at which time he had a severe earache which responded to penicillin therapy. Two weeks later his parents got a note from his teacher stating that the child did not seem to be hearing well. More penicillin was given but the hearing did not clear up. Another course of penicillin was given two weeks later and again two weeks after that, but the hearing still did not clear up. In the early part of March, bilateral serous otitis media was diagnosed and a regrowth of adenoid tissue was discovered. The adenoid tissue was removed surgically and at the same time the fluid was removed from the child's ears. The fluid returned in three weeks. Irradiation to the nasopharynx was done and fluid again was removed from the patient's ears. The patient was seen again twelve months later, at which time the fluid had not returned and hearing was normal.

CONCLUSIONS

Surely the only way that we as physicians can have a clear conscience through the years is for a great awakening to take place. This is the age of antibiotics, and as bacteria become resistant to present antibiotics, perhaps new ones will be developed. Therefore it behooves us to take warning that we can let a far more formidable enemy creep up under our very noses while we are helping combat the old enemy of infection. We must examine every child routinely two weeks after an infectious ear is treated as well as listen carefully while a patient tries to tell us that he has fluid in his ear.

MEDICAL SCHOLARSHIP INFORMATION

A booklet containing information regarding all types of medical scholarships and loan funds, listed by state, was scheduled for release in April by the American Medical Association's Council on Rural Health in cooperation with the Department of Public Relations. The booklet, which contains information about all types of medical scholarships and loan funds now available through medical society, governmental, and other special funds, may be obtained from the Council on Rural Health.

THE CRANIOVERTEBRAL SYNDROME

ROBERT O. WHITSON,* M. D., F.A.C.S., Baytown, Texas

THE purpose of this paper is to call attention to a syndrome that is frequently seen but seldom given adequate treatment. When patients suffering with this symptom complex consult regular physicians, too many are told that they are psychoneurotic. They then fall into the hands of cultists or medicate themselves with various nostrums. An answer to all the problems involved has not been found, but an attempt has been made to review and define them. The basiocciput and first two vertebrae with the soft parts nearby have been given the name "craniovertebral region."[3] Here skeletal motion is accomplished with five complicated, interrelated joints. The upper portions of the vertebral artery and cervical plexus are closely related to these joints, and numerous muscles important in maintaining posture surround them. If it is shown that derangements of these structures are responsible for a clinical entity, its name should be "the craniovertebral syndrome."

LITERATURE

Most authors reviewing the headache problem list lesions of the cervical spine as a possible cause, but pain above the occiput is rarely attributed to lesions in the neck. On the other hand, neck lesions are described as causing pain in the suboccipital region with radiation into the shoulders and arms. Harstock[1] in 1940 and Kelly[5] in 1942 described lesions in the first three cervical segments producing suboccipital pain which, when severe, radiates forward into the vertex and orbit. Jostes[4] in 1942 described the technique of laminagraphy in the diagnosis of lesions in the craniovertebral region. His case histories included patients complaining of pain in the orbit, difficulty in swallowing, tinnitus, and vertigo. Special techniques for roentgen-ray visualization of the first and second cervical rings have been described by various authors. In the middle forties a series of cases were described from South America[2] with the chief complaint of headaches and ocular distress. Osteoarthritis of the occipito-atloid joints was given as the underlying disease. Following this, several papers appeared in foreign journals dealing primarily with headache and occipito-atloid lesions. A survey of the indices uncovers but a few titles associating headache with the craniovertebral region.

ANATOMY

Figure 1 shows the craniovertebral joints in median section. It may be noted that the anterior longitudinal ligament is continued upward as the anterior atlanto-occipital membrane. There is a facet on the back of the anterior arch of the atlas which articulates with a corresponding facet on the front of the dens. There is also a facet and synovial cavity where the transverse ligament of the atlas passes behind the dens. The posterior longitudinal ligament is extended upward, well into the skull, as the membrana tectoria.

Read before the Ninth District Medical Society, April 1, 1953, Baytown, Texas, and the Texas Orthopedic Association, April 27, 1953, Houston.

**Instructor in Orthopedic Surgery, Baylor University College of Medicine, Houston.*

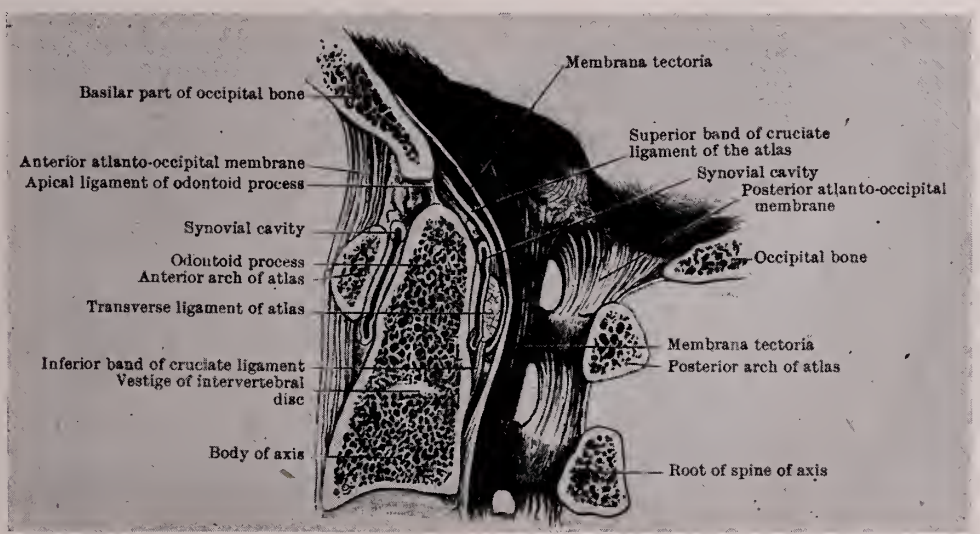

FIG. 1. Median section through the atlanto-occipital and atlanto-axial region. (After Brash, J. C., editor: Cunningham's Textbook of Anatomy, ed. 9, London, Oxford University Press, 1951, fig. 316.)

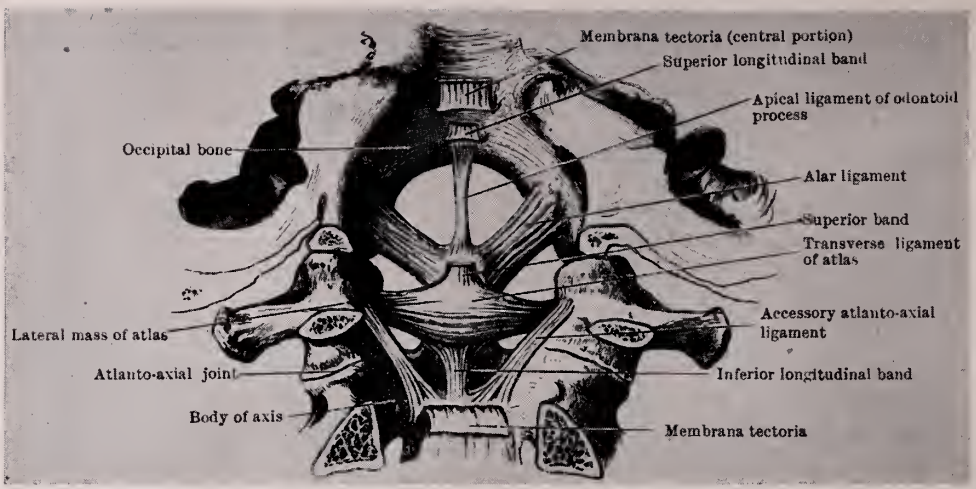

FIG. 2. Dissection from behind of the ligaments connecting the occipital bone, the atlas, and the axis with one another. (After Brash, J. C., editor: Cunningham's Textbook of Anatomy, ed. 9, London, Oxford University Press, 1951, fig. 317.)

Each posterior atlanto-occipital membrane arches over a vertebral artery as it lies on the posterior arch of the atlas.

Figure 2 shows a dissection of the ligaments. The strong transverse ligament of the atlas prevents anterior displacement on the axis. The inferior and superior longitudinal bands serve as check ligaments limiting nodding. The alar ligaments and the accessory atlanto-axial ligaments limit rotation of the occiput on the atlas and of the atlas on the axis, respectively. One can see that motion of the head on the neck is a complex mechanism.

Figure 3 shows the cervical plexus. The trunks of the first and second cervical nerves are closely related to the capsules of the occipito-atloid and atlo-axial joints, respectively. Each hypoglossal nerve passes close to an occipito-atloid joint. The communicating arch from the first to the second cervical nerve supplies afferent and efferent connections with the sympathetic and parasympathetic systems. A recurrent meningeal branch reenters the skull. The second and third cervical nerves contribute fibers to the ansa hypoglossi, accessory nerve, the occipital and auricular nerves, and the anterior cutaneous nerve of the neck.

Figure 4 shows the vertebral artery arising from the subclavian and ascending through the foramina transversaria of the sixth through the first cervical vertebrae. Here it courses over the posterior arch of the atlas against the capsule of the occipito-atloid joint to enter the skull by the foramen magnum lateral to the medulla. It pierces the dura and arachnoid to lie in front of the medulla and lower border of the pons. Within the skull vertebral arteries from each side unite to form the basilar artery, which extends upward and forward to end by dividing into the posterior cerebral arteries. The cerebellar, pontine, and posterior cerebral arteries are part of the vertebral system. It is readily apparent that autonomic phenomena secondary to irritation of the vertebral arteries might have widespread distribution.

PATHOLOGY

The variations which are found in the craniovertebral area suggest that it is transitional, though per-

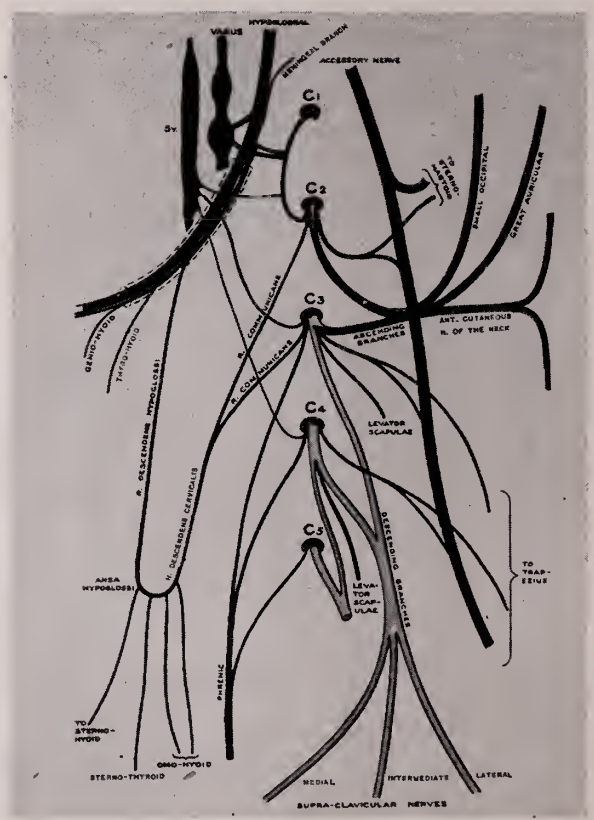

FIG. 3. The left cervical plexus. (After Brash, J. C., editor: Cunningham's Textbook of Anatomy, ed. 9, London, Oxford University Press, 1951, fig. 919.)

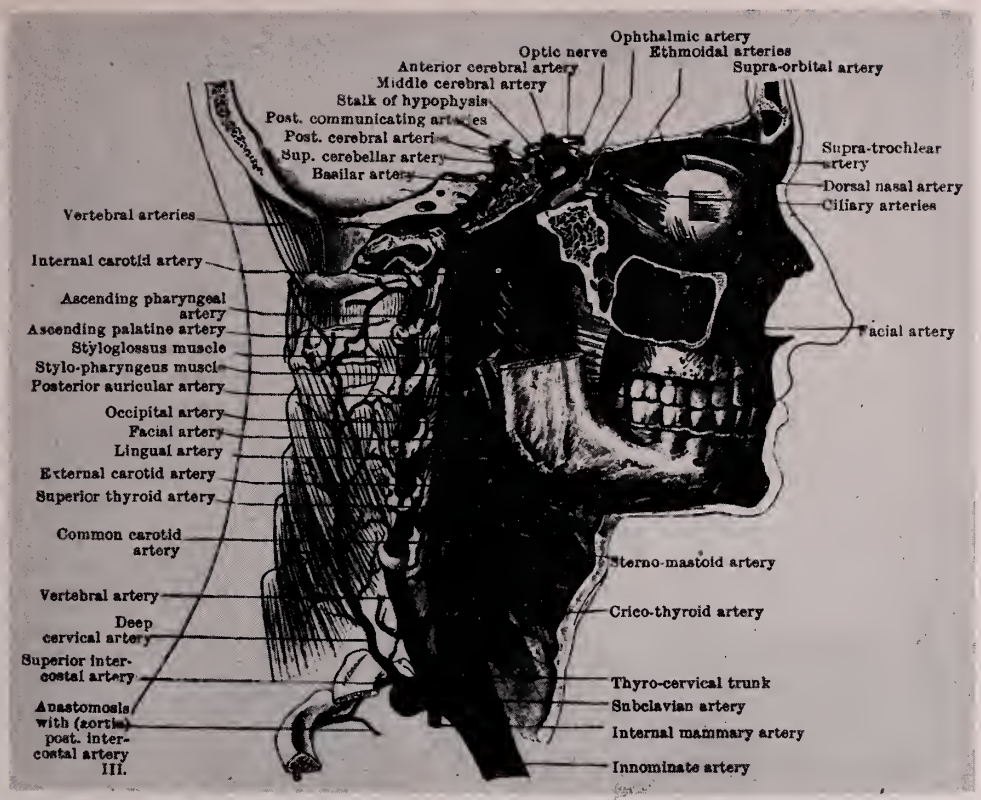

FIG. 4. The vertebral artery and main branches. (After Brash, J. C., editor: Cunningham's Textbook of Anatomy, ed. 9, London, Oxford University Press, 1951, fig. 1083.)

haps not to the same extent as the lumbosacral region. The two most common variations are manifestation of the occipital vertebra (fig. 5a) and assimilation of the atlas (fig. 5b). Other anomalous conditions seen in the craniovertebral region are bipartite or double facets on the occipital condyles, a midline anterior tubercle on the occiput articulating with the dens, incomplete fusion of the posterior arch of the atlas, a shift in position of the occipital condyles, and other forms of asymmetry.[3]

Suppurative processes in the upper part of the neck may spread by extension to involve the craniovertebral joints. Osteoarthritis of the craniovertebral joints appears to be fairly common. Involvement of the craniovertebral joints by rheumatoid arthritis has not been described; however, there is no reason that these joints should be exempt. Fractures and ligamentous tears in the craniovertebral region result in a derangement of the intricate mechanical system and, in time, degenerative changes. Disorders of function without anatomic changes, such as chronic postural strain, are the cause of some of the symptoms to be described.

Further study might reveal that the craniovertebral region is in many respects analogous to the lumbosacral region, with headache being the counterpart to sciatica. A review of the anatomy of the region demonstrates that inflammation of the ligaments and membranes about the craniovertebral articulations could cause distant pain. The cause of this symptom complex is probably the irritation of the sympathetic plexus surrounding the vertebral arteries. If this is true, it provides an explanation of the causalgic type of pain and autonomic phenomena. Anyway, there

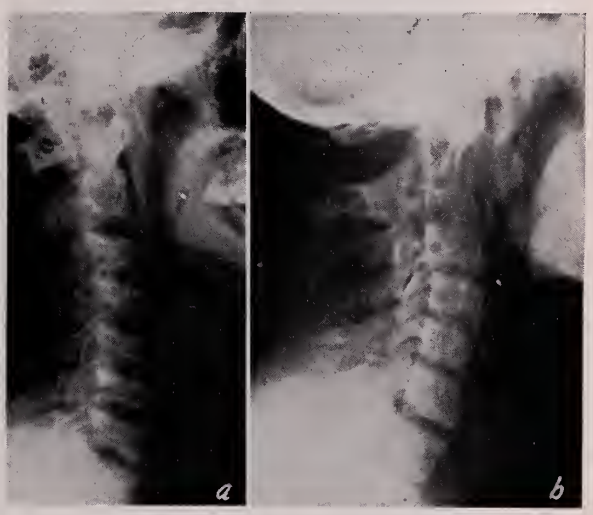

FIG. 5a. Congenital variation in the craniovertebral region which may represent "manifestation" as described by anatomists.
b. Congenital variation in the craniovertebral region which probably represents "assimulation" as described by the anatomists.

are multiple possible mechanisms by which lesions in the craniovertebral region might produce the symptom complex to be described.

HISTORY AND EXAMINATION

Patients with headaches as part of the craniovertebral syndrome usually give a history of past trauma to the head or neck or of severe infection about the neck. The patient may complain of headache in the temporal or orbital regions. On questioning, however, it can be brought out that the headaches usually start with a feeling of tightness and aching in the suboccipital region. The pain is often neuralgic in character. The headaches frequently develop during sleep, and many patients relate that they cannot use a firm pillow. Sustaining the head in a strained position and constant readjustment of head balance precipitate attacks. Ocular symptoms include photophobia, lacrimation, conjunctival injection, and pain around the orbit. Aural symptoms include earache and popping or buzzing in the ear. Occasionally patients have pain in the region of the throat. Intermittent attacks of acute torticollis are common. Dizziness and mild vertigo are frequently mentioned, but never syncope. Usually the precipitating stress immediately precedes the attack. The attacks may be infrequent or may occur almost daily. Many of the patients find that certain positions of the neck tend to aggravate or relieve the pain and discover trick maneuvers for partial relief. Because of the ocular symptoms, many have had frequent changes of glasses without benefit. Psychoneuroses develop in some as a result of chronic pain with uncertainty as to its cause.

Patients with the craniovertebral syndrome have tenderness beneath the occipital protuberance and behind the mastoid processes. They may have tenderness beneath the superior nuchal ridge and be-

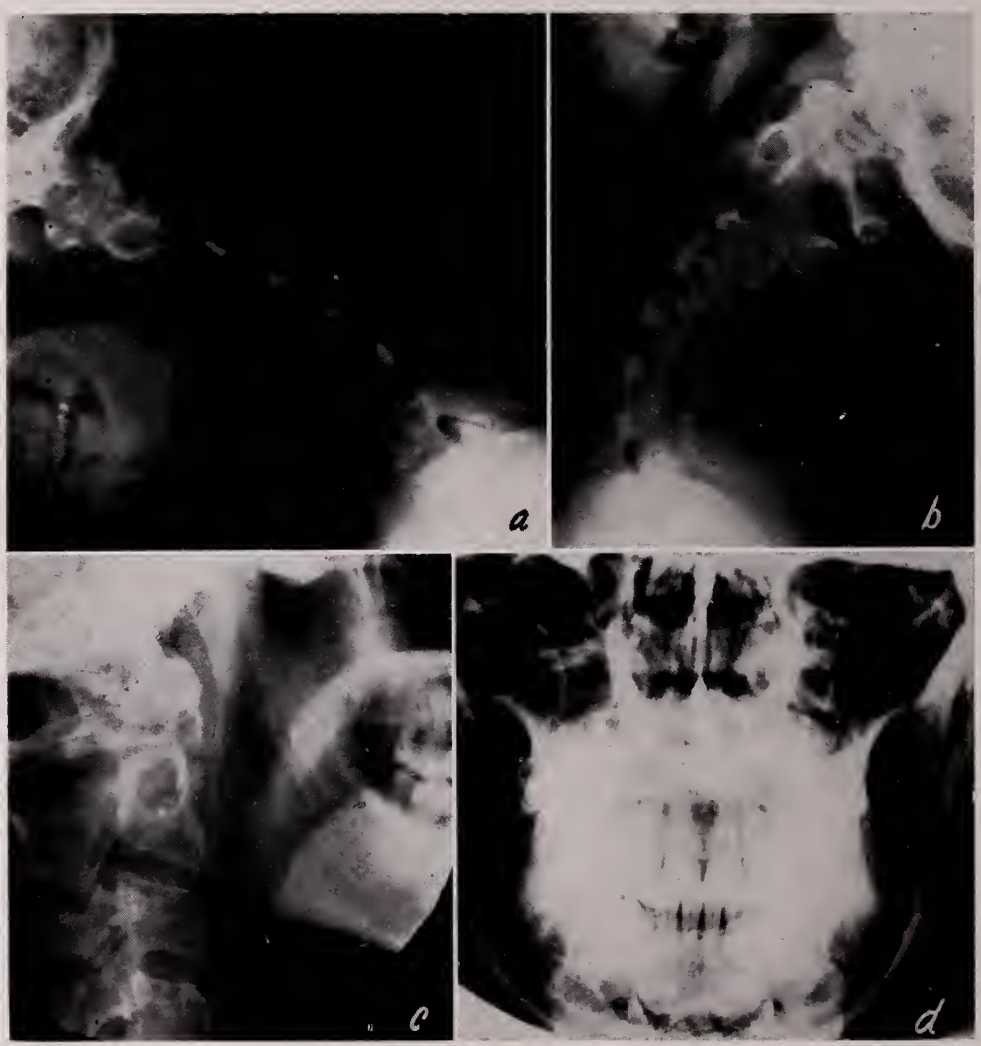

FIG. 6a and b. Case 1. Lateral views of the cervical spine in flexion and extension.

c and d. Case 2. Coned lateral and postero-anterior views of the craniovertebral joints.

tween the scapulae. There is limitation of flexion and extension. Limitation of rotation and lateral bending is usually asymmetrical. Hypesthesia of the scalp or face is inconstant. Crepitation of the cervical spine frequently can be demonstrated at will, and the compression test is generally positive. The autonomic phenomena during acute attacks may be dramatic. However, if the patient is seen between attacks, there may be few physical findings.

Frequently the symptom complex associated with osteoarthritis of the cervical spine, namely, suboccipital and neck pain radiating into the shoulder and arm, is also manifest. The craniovertebral syndrome indicates a pathologic condition at the junction of the skull and neck. The cervicobrachial syndrome indicates involvement of the lower cervical vertebrae.

Difficulties encountered in adequate roentgen-ray demonstration of the craniovertebral joints undoubtedly account for the lack of interest in this region. The usual routine roentgenography fails to demonstrate lesions that might be significant; therefore, careful positioning, technique, and interpretation should be employed. If more of these cases are carefully studied, the following roentgen-ray findings

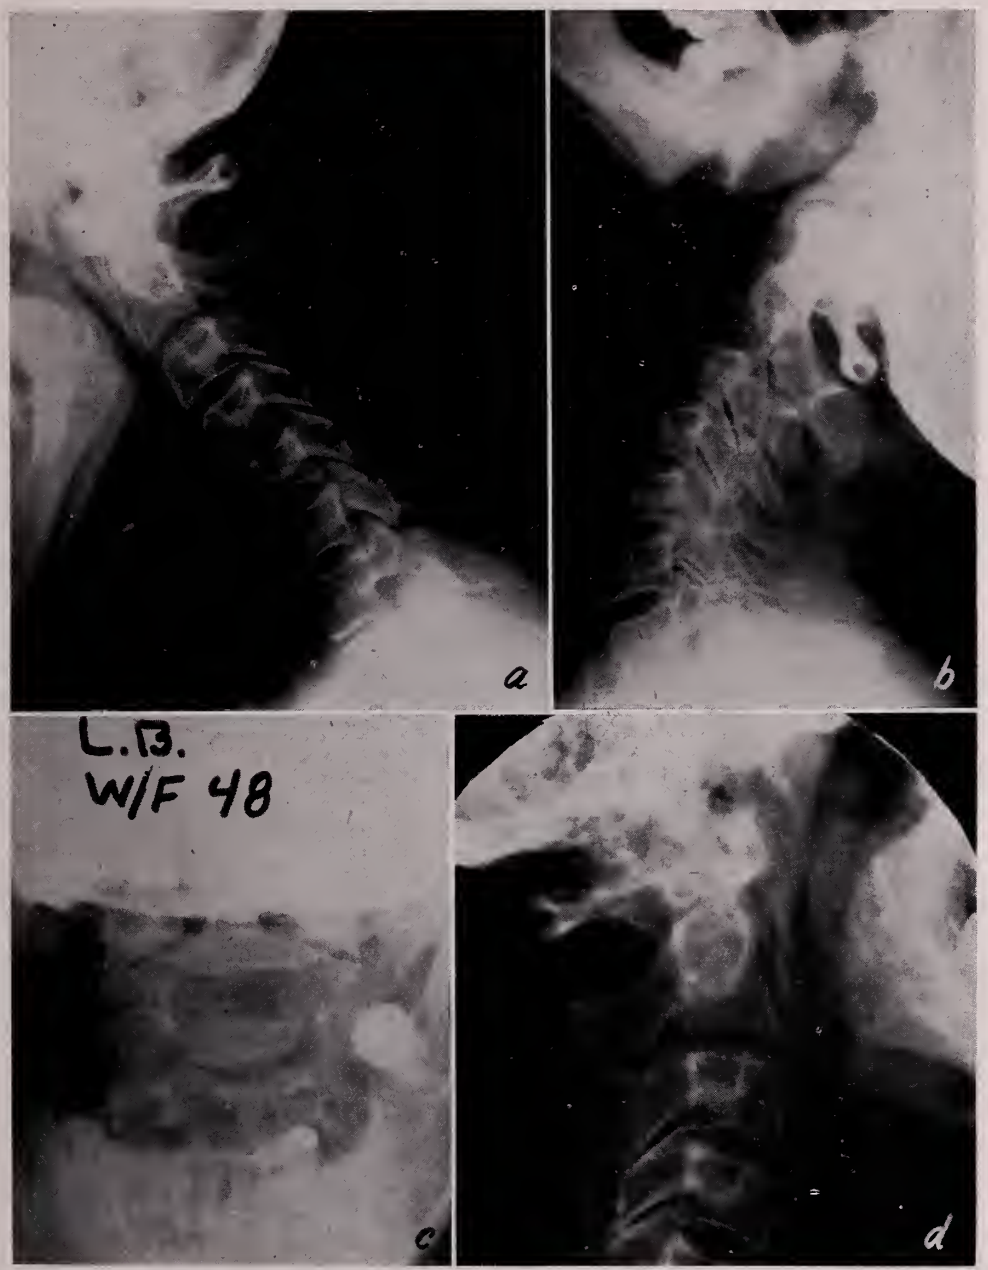

FIG. 7a and b. Case 2. Lateral views of the cervical spine in flexion and extension.

c and d. Case 2. Coned anteroposterior and lateral views of the craniovertebral joints.

may prove to be significant: (1) a range of motion of less than 1 cm. between the posterior arch of the atlas and the base of the occiput on films made at 72 inches; (2) when motion is reduced at the occipito-atloid joint, an increased range of motion, with subluxation, at the median atlo-axial joint; (3) osteoarthritic changes about the atlo-axial and occipito-atloid joint; (4) calcification of the posterior occipito-atloid membrane over the vertebral artery; (5) ossification of the anterior occipito-atloid membrane; (6) narrowing and marginal lipping in the antero-posterior projection of the occipito-atloid and atlo-axial joints; and (7) subluxations of these joints. These findings are often disregarded because they are so common in roentgenograms of persons past middle life. Cervical films of young persons without head or neck complaints rarely show them. When static or acute stresses are added to these structural imperfections, they must be considered a cause for symptoms.

TREATMENT

Treatment is not always easy. Many patients are discouraged and anxious because of previous failures and conflicting diagnoses. Reassurance and explanation help to alleviate nervous tension. Mephenesin, salicylates, and vitamins are useful. Analgesics may be necessary for short periods.

Rest, manipulation, heat, and irradiation form the basis of treatment. Rest is provided by means of a Thomas collar and special pillows. Manipulative therapy is most conveniently and safely applied by means of the canvas head halter. Intermittent vertical traction, with restricted flexion, extension, and lateral motion, is highly beneficial. Horizontal traction up to 7 to 10 pounds is restful. Prolonged periods of continuous cervical traction are not desirable as they frequently aggravate the complaint and produce increased nervous tension. Heat, in any form, hastens the patient's response. Roentgen-ray therapy is worthy of trial in selected cases. Once the patient has become convinced that something can be done for him, he should be instructed in the tech-

c and d. Case 3. Coned postero-anterior and lateral views of the craniovertebral joints.

niques of treating himself at home and advised that ordinary aspirin is his medication of choice. By judicious self management and avoidance as much as possible of the precipitating activities, these patients obtain satisfactory results from conservative treatment.

ILLUSTRATIVE CASES

These cases were selected to try to demonstrate some of the findings encountered. Unfortunately, features discernible on the original roentgenograms have been partially obscured in reproduction.

CASE 1.—O. A., a white woman aged 29, complained of severe neck pain. She had suboccipital and frontal headaches and complained of pain in her throat. There was crepitation in the ears. Neurologic examination was negative. There was marked tenderness over the occipito-atloid joint. Neck motion was markedly limited in all directions. The patient was provided with a cervical brace and started on traction, experiencing considerable relief. Roentgenograms in flexion and extension (fig. 6a and b) revealed no motion at the occipito-atloid joint. Lateral views coned on the occipito-atloid joint (fig. 6c) revealed calcification of the anterior ligament. The postero-anterior view (fig. 6d) revealed narrowing of the atlo-axial joint, particularly on the right, with spur formation on the left. The occipito-atloid joints were symmetrical but the joint spaces were narrow.

CASE 2.—L. B., a white woman aged 48, complained of pain between the shoulder blades with occasional paresthesia into the left arm. She also complained of suboccipital headache radiating into the frontal and orbital regions. This patient gave the story of receiving a severe jolt while riding in a car and being relieved of a headache with which she was suffering at the time. Examination revealed moderate limitation of cervical motion in all directions. Neurologic examination revealed mild hypesthesia over the left little finger. Her reflexes were equal and normal. Lateral roentgenograms of the cervical spine in flexion and extension (fig. 7a and b) revealed some reduction of motion at the occipito-atloid joint with superior subluxation of the median atlo-axial joint and degenerative changes. The coned anteroposterior and lateral views (fig. 7c and d) showed the degenerative changes better. This patient obtained satisfactory relief with local heat, salicylates, and a neck pillow. Explanation and reassurance contributed greatly to this patient's improvement.

CASE 3.—W. A. E., a white man aged 60, complained of suboccipital and frontal headaches present since an automobile accident about a month previously. There had been some conjunctival injection and photophobia on the left. Examination revealed tenderness from the suboccipital region to the spinous process of the second thoracic vertebra. Flexion was limited. Lateral bending and rotation were asymmetrical. Lateral roentgenograms of the cervical spine in flexion and extension (fig. 8a and b) revealed reduced motion at the atlo-occipital joint with a superior subluxation at the median atlo-axial joint. Postero-anterior projection of the atlas (fig. 8c) revealed a mild subluxation on the right with marginal lipping. The diagnosis of traumatic aggravation of craniovertebral and cervical osteoarthritis was made and the patient improved on mephenesin, salicylates, and head traction.

CASE 4.—M. J. S., a white man aged 31, complained of intermittent occipital and orbital headaches occasionally associated with ocular symptoms. There was mild discomfort on full flexion but clinically no limitation of motion. Lateral rotation was reduced asymmetrically. Lateral views of the cervical spine in flexion and extension revealed reduced motion at the occipito-atloid joint with superior subluxation at the median atlo-axial joint. Coned views of this region (fig. 9) revealed partial ossification over the vertebral artery. There was hypertrophic lipping at the lower margins of the median atlo-axial joint. There was also narrowing of the lateral atlo-axial joints, most marked on the left. This patient improved with heat, salicylates, neck pillow, and head halter traction.

My experience is based on private patients on whom systematic follow-up examinations have not been accomplished; therefore, a compilation of end results is not possible at this writing.

COMMENT AND SUMMARY

There is a definite symptom complex of suboccipital pain which, when it becomes severe, radiates toward the vertex and orbit. When it becomes intense, the headache and ocular symptoms may overshadow the suboccipital complaints. Frequently there are manifestations indicating involvement of the autonomic nervous system. In many of these patients, the symptoms can be shown to be due to arthropathy

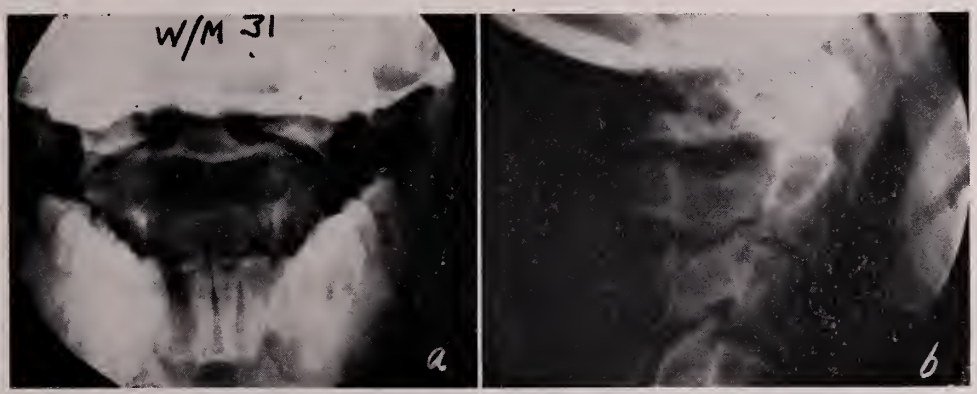

FIG. 9a and b. Case 4. Coned anteroposterior and lateral views of the craniovertebral joints.

of the occipito-atlo-axial joints. Others may be due to postural dysfunction without anatomic derangement. "Craniovertebral syndrome" is suggested as a name for this symptom complex. Whatever the cause, many of these patients respond to traction, heat, rest, mephenesin, and salicylates. The possibility of rheumatoid involvement in the craniovertebral region should not be overlooked as further studies along this line might help to clarify the etiology of idiopathic migraine.

Mysoline in Epilepsy

LUDLOW M. PENCE,* M. D., Dallas, Texas

A CLINICAL investigation of a new anticonvulsant drug, Mysoline,† was undertaken at Parkland Hospital in December, 1951. The first month of the investigation was under the direction of Dr. Thomas Farmer, formerly of Southwestern Medical School of the University of Texas,‡ using hospitalized patients. Then the project was moved to the Parkland Hospital Epilepsy Clinic under my direction. Experiences in the past twenty-six months have given considerable evidence that Mysoline is a relatively nontoxic, effective anticonvulsant drug.

Mysoline chemically is 5-phenyl-5 ethyl hexahydropyrimidine-4: 6-dione. It is closely related to phenobarbital but belongs to a chemical type that has not been used previously as an anticonvulsant drug. The first report on the clinical use of this drug was prepared by Handley and Stewart.[2] Other references are listed in the bibliography.

Patients chosen for this study had been known by me for periods ranging from six to twenty-six months. During this time various anticonvulsants had been used including Dilantin, Mesantoin, phenobarbital, Mebaral, Tridione, and Milontin. For this study 30 patients were chosen out of a total of some 140 patients regularly attending the clinic. An additional group of 18 private patients also were included. These 48 patients were not considered as being under control with previous medications. This method of selection gives a new drug a rather rigorous trial, but it is not always feasible to change a well controlled epileptic patient to a new drug of unknown value.

The patients were started first on Mysoline in gradually increasing dosage with a gradual decrease in previous medication over a period of about two weeks. It was found that the effect of Mysoline could be noted within a week in most cases. The dose varied from 1 to 9 tablets per day (250 mg. in each tablet). The average patient required 4 tablets per day. It is desirable to use the least medication that will give control; hence variations in the amount used occurred. It was found that small children were able to tolerate 3 tablets per day as well as an adult.

It was observed that certain patients seemed to become quite drowsy when Mysoline was being used along with Dilantin and phenobarbital during the change-over period. Further reduction of Dilantin and/or phenobarbital obviated this difficulty.

RESULTS

A total of 48 patients have been observed over a period of six to twenty-six months. Of these 48 patients, 42 are still taking Mysoline. The other 6 have been dropped from the study for various reasons. Three of these 6 received no benefit from Mysoline. The other 3 failed to return for follow-up visits.

Of the 45 patients who have participated in this trial satisfactorily, 32 obtained excellent results; 10 were improved; and 3 were unimproved.

AGE AND SEX

The youngest patient in this series was 3 years old and the oldest 58 years; 15 patients were less than 15 years of age; 28 were between 15 and 40 years of age; and 5 were past 40. Twenty-two were male and 26 female.

*Clinical Instructor in Neurology, Southwestern Medical School of the University of Texas.

†Mysoline was furnished by Ayerst, McKenna, and Harrison, Ltd., New York.

‡At present Dr. Farmer is with the University of North Carolina Medical College, Chapel Hill.

DOSAGE

Wide variations in the amount of Mysoline needed and tolerated occurred. No attempt was made to increase the dosage to toxic levels. The upper dose limit was set by the results obtained. It was found that when the maintenance dose was reached, the patient could remain under control without having to increase the dose further.

Mysoline was used alone in 11 out of the 48 cases. In the other 37 cases, it was combined with phenobarbital, Mebaral, Dilantin, or Mesantoin. The average patient required 3 tablets per day. However, many required 5 or 6, and 1 patient, 9 per day. It was noted that smaller doses of Mysoline were needed when it was combined with one of the other anticonvulsants.

When Mysoline was used alone, 8 patients had excellent results, 1 was improved, 1 showed no change, and 1 was dropped from the study because of failure to take medication regularly. Table 1 gives the results of various combinations.

TABLE 1.—*Results of Medication with Mysoline Alone and in Combination in 48 Epileptic Patients.*

Medication	Excellent	Improved	Poor	Unknown
Mysoline	8	1	1	1
Mysoline + phenobarbital	1	1	1	0
Mysoline + Dilantin	5	2	0	0
Mysoline + Phenobarbital + Dilantin	7	1	1	0
Mysoline + Mebaral	5	0	0	1
Mysoline + Mebaral + Dilantin	5	5	0	1
Mysoline + Mesantoin	1	0	0	0
	32	10	3	3

It should be understood that all 48 of the patients were uncontrolled on previous standard medication. This means that they were either changed from their previous medication to Mysoline or else Mysoline was added to the list. In all cases when Mysoline was added to the regimen, the other medications could be reduced. It appears that Mysoline alone or combined with a hydantoin or with Mebaral gave the best results. Table 1 shows that 32 out of 48 patients obtained excellent results.

TYPES OF SEIZURES

Although the absolute classification of the type of seizure may be impossible since the physician rarely ever witnesses an attack, an attempt was made to break the patients down into categories: grand mal, petit mal, focal seizures, and psychomotor epilepsy.

In evaluating the results with Mysoline in relation to the type of seizure, it was found that the greatest reduction in number of seizures occurred with grand mal and with psychomotor attacks. Out of 19 patients having grand mal seizures, 16 experienced complete relief from the seizures. These patients were taking Mysoline alone or in combination with Dilantin or with phenobarbital and Dilantin.

With the type of seizure considered to be petit mal, 9 out of 12 patients reported profound reduction in spells and 2 reported about 75 per cent reduction. In general, Mysoline plus Dilantin and phenobarbital gave the best results. Mysoline alone was beneficial in only 1 out of these 12 cases.

In the patients with focal seizures, including the post-traumatic group, brain tumor, temporal lobe seizures, and minor motor attacks, only 5 out of a total of 15 patients were completely relieved of attacks. In 2 cases, the medication had no beneficial effect. In the other 8 patients about 80 per cent reduction in spells occurred. It therefore appears that the symptomatic convulsive group with focal seizures may be benefited the least.

There were 2 patients with psychomotor seizures. In both cases, Mysoline alone produced a complete cessation of attacks, and this happy situation has continued to exist for more than a year in both cases. In 1 of these cases, as many as one seizure daily had been occurring on previous medications up to toxic levels. Phenurone was not tried in either case.

TOXIC EFFECTS

Practically all anticonvulsant drugs will produce toxic effects if used in large enough amounts. Mysoline is not an exception, but it appears that its anticonvulsant action is great enough that relatively nontoxic doses may control seizures. Out of these 48 patients only 2 developed what they considered to be serious side effects. In both cases, marked drowsiness occurred after the first tablet was taken, and the patients refused to continue the medication. However, the drug was readministered to both patients later without the same trouble.

Ten patients noted an undesirable reaction consisting of drowsiness, dizziness, slight ataxia, and in 1 case, diplopia. One patient experienced a sharp increase in irritability and suspiciousness. This ceased in about four days after medication was reduced. Only 1 patient experienced nausea. Toxic effects were noted when 4 to 6 tablets were taken daily. The side effects developed within a week after the drug was started. In all cases these complaints ceased after reduction of the dosage. Consequently, after the proper dose was established, Mysoline was well tolerated without side effects.

Repeated urinalyses and blood counts failed to reveal any abnormalities. No skin rash was noted. Where gum hypertrophy had been present from Dilantin, the addition of Mysoline permitted reduction of the Dilantin so that the hypertrophy improved.

Many patients who had been taking large doses of phenobarbital and Dilantin without control of seiz-

ures were well pleased with the results obtained when Mysoline was substituted for all or part of their previous medication. In many patients as little as 1 of the 250 mg. tablets of Mysoline along with Dilantin or Mebaral produced excellent results. They felt that they were much more alert and capable of going about their duties on Mysoline. This is a subjective improvement, but it is of great significance to any person with epilepsy.

SUMMARY

Mysoline, a new anticonvulsant drug, appears to have definite usefulness in the control of epileptic attacks of all varieties.

Mysoline may greatly enhance the effectiveness of barbiturates and hydantoins when used in combination with them.

It appears to be a relatively nontoxic drug and it did not produce any known serious side effects in a group of 48 patients.

Neomycin-Erythromycin Ointment in the Treatment of Pyodermas

J. FRED MULLINS, M.D., Galveston, Texas

SINCE it is apparent to date that no single antibiotic is effective against all strains of pus-forming organisms, a combination must be sought which will cover the majority of strains of gram-positive and gram-negative bacteria. The object of this paper is to help corroborate, in a minor way and from a strictly clinical standpoint, the extensive in vitro and in vivo work with the combination of neomycin and Erythromycin in pyogenic infection of the skin done by Livingood.[1] He found by in vitro tests that the combination of neomycin and Erythromycin was potentially superior to other antibiotic combinations. Erythromycin, which was derived from Streptomyces erythreus and first described by McGuire,[3] is extremely effective against hemolytic Staphylococcus and hemolytic Streptococcus, particularly those strains which have been resistant to other antibiotics. Since neomycin is effective against all gram-negative organisms, it was decided to use a combination of these two antibiotics for the treatment of pyogenic infections of the skin.

In addition to having superior bactericidal properties, an ideal combination should give a low sensitization rate when locally applied and should be composed of agents that are not being routinely used parenterally since this last factor seems to increase the sensitizing powers of the antibiotics. If in vitro sensitivity tests could be executed on each organism isolated from a pyoderma and from the results the specific antibiotic selected and used, the cure rate of lesions would be greatly enhanced. However, this is impractical and uneconomical in the majority of cases, and this leads to a trial and error system. Sulfonamides, penicillin, streptomycin, Aureomycin, Chloromycetin, polymyxin, bacitracin, and neomycin are all very potent antibiotics, and most have a rather broad spectrum of activity, but no single one is effective against all strains of gram-positive and gram-negative organisms.

Livingood and Mullins[2] found that neomycin was extremely effective in Micrococcus pyogenes var. aureus (Staphylococcus aureus hemolyticus, coagulase positive) infections; very good against Proteus, Pseudomonas, and other gram-negative bacteria; but only moderately effective against certain strains of hemolytic Streptococci. Polymyxin B was a superior agent in Pseudomonas infections but relatively ineffective against the other gram-negative organisms. Neomycin was a good over-all agent against both gram-negative and gram-positive organisms but stiill left something to be desired; that is certain strains of hemolytic Streptococci were very resistant. Chloromycetin was used effectively systematically, but we did not evaluate its local properties. The efficacy of Terramycin locally has been well shown in the work by Wright.[4]

In the series reported in this paper, four separate ointment bases were used containing 4 mg. per gram each of neomycin and Erythromycin. Parabens, meth-

From the Department of Dermatology and Syphilology, University of Texas School of Medicine.

The Neomycin-Erythromycin preparations utilized in this study were furnished by the Upjohn Company, Kalamazoo, Mich.

yl, and so forth and N-butylparahydroxy-benzoate were added to three of the ointment bases to inhibit Monilia albicans, which sometimes occurs following the use of these antibiotics. It is still not definitely known whether the sterile field created by these antibiotics allows the growth of Monilia or the monilial growth is actually enhanced by these drugs. The first and second bases were a mixture of mineral oil, petrolatum, and lanolin. The third base was plain petrolatum, and the fourth was a cholesterolized base without wool fat. All except the first contained parabens.

As shown by table 1, there were 88 cases in the series, and they were principally primary pyodermas and secondarily infected dermatoses. Primary pyodermas, such as impetigo contagiosa, ecthyma, folliculitis, and acute paronychia, responded readily to treatment in periods varying from two to seven days with the majority clearing in three to four days. In 1 case of severely infected, denuded stasis dermatitis of the lower legs, which had existed and been subjected to many therapeutic agents for forty-two days previously, there was complete healing in five days. The cases of impetiginized dermatitis were contact dermatitis, dermatophytosis, eczematous dermatitis, and so forth which presented secondary infections that had to be eradicated before the basic disease could be treated. Surgical wounds following minor surgery were dressed with these preparations, and no secondary infections occurred. Certainly this small number of cases has no great statistical significance but deserves further investigation.

TABLE 1.—*Results of Treatment of Pyodermas with Neomycin-Erythromycin Ointment.*

Diagnosis	No. Cases	Results		
		Excellent†	Fair‡	Poor§

Total	88	74	7	7

*Secondarily infected eczematous dermatitis, superficial fungi, and so forth.
†Healed within 2 to 7 days.
‡Healed within 10 to 12 days.
§Healed in more than 2 weeks or no improvement.

The four different ointment bases were equally divided among the cases and were routinely applied three times daily. Not a single case of primary irritation or sensitization was observed although many of these cases were vulnerable to such an occurrence. Livingood[1] has observed primary irritation but no sensitization in a small number of his series, but this irritation was found to be due to the ointment base. No cases of moniliasis were observed in the series reported here even though many of the cases of eczematous dermatitis would have served as a suitable invasion site for Monilia albicans.

There were approximately 250 cases which are not included in this series upon which these ointments were used to evaluate the possibilities of primary irritation or sensitization. None in this particular group showed either of these untoward reactions, and the respective pyogenic elements were readily eradicated.

CONCLUSIONS

Eighty-eight cases of primary pyoderma or impetiginized dermatitis were treated with ointments containing 5 mg. per gram each of neomycin and Erythromycin. Various ointment bases were used to determine the one which was least likely to give irritation or sensitization, but no significant difference was noted.

Excellent results were observed in less than seven days in the majority of cases, particularly the primary pyodermas.

No cases of moniliasis were observed, and no cases of primary irritation or sensitization were found.

Although this is a small series of cases, this combination appears superior in cutaneous pyogenic infections to any single or combination of antibiotics that I have had an opportunity to use to date.

Bureau of State Services

The Bureau of State Services, the principal operating arm of the service for federal-state, interstate, and international health activities, has been reorganized by the United States Department of Health, Education, and Welfare. The number of operating divisions has been cut from sixteen to six and includes the Divisions of General Health Services, Special Health Services, Sanitary Engineering Services, International Health, Dental Public Health, and the Communicable Disease Center, Atlanta, Ga.

EFFECT OF A COBALT-IRON MIXTURE ON THE ANEMIA OF PREMATURITY

J. J. QUILLIGAN, JR., M. D., Dallas, Texas

THE action of cobalt in stimulating normal marrow to produce a polycythemic state[3, 4] suggested its possible use in the anemia of prematurity. The effect in such a group of patients not only could give information regarding the value of cobalt but also might possibly help in a better understanding of its mode of action. It was with these points in mind that the present study was undertaken. The results to date are promising enough to warrant a presentation of them at this time.

MATERIALS AND METHODS

The study group was composed of 38 premature infants in the Parkland Hospital premature unit.* They were placed on the basis of serial admissions in one of three groups: Group 1, 12 prematures who received no special medication and acted as a control group. Group 2, 10 prematures who received 75 mg. of ferrous sulfate in a 0.6 cc. mixture every day. Unfortunately the number in this group is too small for significant observations. Group 3, 16 prematures who received 0.6 cc. daily of a cobalt chloride–ferrous sulfate mixture, a commercial preparation† containing 40 mg. of cobalt chloride and 75 mg. of ferrous sulfate per dose.

Blood counts were obtained by heel puncture at approximately weekly intervals while the babies were in the premature unit. Follow-up studies were done at ten day intervals whenever possible after discharge from the unit. Unfortunately the number seen as follow-ups was small and will not be included beyond the sixty day period in the present report. The babies were closely observed daily for ill effects of the medication while at the premature unit and when they returned for check-ups. None of them showed harmful effects despite the large doses. However, it should be noted that during the study mild diarrhea was noted sporadically in the premature unit. The incidence of cases was as great in the control group as in the cobalt-iron group. A few of the babies receiving the cobalt-iron preparation have been followed for more than 100 days with no ill effects noted.

Hemoglobins were read as oxyhemoglobin in the Evelyn photoelectric colorimeter. Two red blood cell counts were done on each patient using United States Bureau of Standard certified equipment. Hematocrit levels were obtained in heparinized capillary tubing which was sealed on one end and centrifuged in special tubes at 3,000 rpm for thirty minutes and measured with a microscopic vernier. The average of two or three capillaries was used for each determination. Reticulocyte counts were made from dry cover slip preparations stained with brilliant cresyl blue stain; 500 cells from each cover slip were averaged and the results were expressed as percentages.

The determinations for all infants in a group were averaged for each time period as shown in the tables. Unfortunately the numbers in each group finally became so small that data beyond a sixty day interval were not significant. The standard deviation of the means for each time period and the significance of the differences of the means between the control and the treated group were calculated by use of the following formulas:

$$(1)\quad \text{Standard Deviation of the Mean} = \sqrt{\frac{\Sigma d^2}{n(n-1)}}$$

$$(2)\quad X = \frac{M_1 - M_2}{\sqrt{SD_1^2 + SD_2^2}}$$

Σ = sum of
d = difference of a single determination from the mean
n = total number of determinations in a given instance
M = mean value
SD = standard deviation
X = significance of the difference of the means

X was then converted into a P value (probability of X being due to chance*) by consulting the table of ordinates of the normal distribution in Fisher and Yates.[2]

RESULTS

Weight.—Table 1 shows the mean weights for each time period expressed as a fraction of the mean initial weight. It can be seen that the group receiving the cobalt-iron did not gain as rapidly as the control group. The differences in the eleven to

From the Southwestern Medical School of the University of Texas and the Children's Medical Center.

Presented in part before the Texas Pediatric Society, Corpus Christi, October 2, 1953.

Aided in part by grants from the W. W. Caruth Foundation and Lloyd Brothers, Cincinnati, Ohio.

I wish to thank Mrs. Sarah Miller and members of the nursing staff of the premature unit at Parkland Hospital for their kind cooperation in this study.

†*Roncovite supplied by Lloyd Brothers.*

**For example, a P value of .01 could be interpreted as indicating that the probability of the difference observed being due to chance is 1 in 100.*

twenty day period are significant, indicating that the cobalt-iron group did not gain as fast as the control group. However, the differences at later ages do not show significance, suggesting that the early effect of the cobalt-iron is overcome with continued growth.

TABLE 1.—*Mean Weight Gain of Premature Infants.*
(Expressed as fraction of average birth weight.)

Group	Time in Days 0-10	11-20	21-30	31-40	41-50
Control	1.06	1.25	1.44	1.58	1.81
Co-Fe	1.03	1.15	1.31	1.54	1.68

Hemoglobin.—The results of hemoglobin determinations are shown in table 2, where the first differences are observed in the twenty-one to thirty day interval. At this point a difference in the means can be noted; it is not yet significant but indicates a trend established more clearly in the next time interval when the average values show highly significant differences. It is of some interest that the differences observed in the forty-one to fifty day period are not as great as the intervals immediately before or after. This may be because the small number of prematures in the control group influenced the significance of the values. However, there can be no doubt that the average hemoglobin values in the other time periods beyond forty-one days are greater in the cobalt-iron treated group.

Hematocrits.—The data in table 3 show the mean hematocrit values, which show agreement with the hemoglobin determinations in that the cobalt-iron treated groups show higher hematocrit values at twenty-one days and that this difference is significantly larger except for the forty-one to fifty day interval when the P value is greater than 0.05. Again, the lack of significance here may be due to the small number of observations in the control group.

Red Blood Cell Counts.—The mean values of red blood cell counts in the control and the cobalt-iron treated groups are shown in table 4. Even though the hemoglobin and the hematocrit values give significant differences between the control and the cobalt group, the red blood cell counts do not. The only time interval in which differences of any magnitude can be noted is from thirty-one to forty days. However, when the difference is tested for significance, none obtains.

%	1.9	1.4	1.4	2.3	4.0	1.9
No. detns.	11	12	13	6	9	6

Reticulocytes.—Data on reticulocytes are shown in table 5. The maximum response in the control group occurred during the thirty-one to forty day interval and in the treated during the forty-one to fifty day interval. These are average figures, and it is possible that with more data these figures will change. However, the degree of reticulocyte response is never very great and lags by twenty days behind the first detectable differences in hemoglobin values.

SUMMARY

The cobalt-iron treated group show less of a drop in the hematocrit and hemoglobin values than the control group. The lack of difference in the red blood cell counts of the two groups points more to an effect on cell volume rather than number and indirectly refutes dehydration as a possible explanation of the differences observed in the hemoglobin and hematocrit figures. The fact that the maximum reticulocyte response occurs ten days after the hemoglobin changes are first noted is of considerable interest. It appears that the greater hemoglobin and hematocrit values in the cobalt-iron group could be

due to the continued presence of red blood cells that in the control group have been destroyed. The idea that cobalt interferes with erythrophagocytosis has been postulated by other investigators[1] and supported to some extent by observations of Rohn and Bond.[5] Whether or not this is a factor in the premature infant must await further studies which are in progress.

The mode of action appears to be a dual one in delaying the red blood cell breakdown as well as in actually stimulating marrow as postulated by others.[3, 4] The mechanism of stimulation is of considerable interest; in addition to the factors of absorption and utilization of iron, the problem of fetal-adult hemoglobin is encountered in the premature and should be elucidated, for the opinion has been held that formation of adult hemoglobin is not as efficient as usual in the presence of large amounts of fetal hemoglobin.

CONCLUSION

Preliminary observations on a group of 12 premature infants who received no special medication and 16 prematures who received a commercial preparation of cobalt chloride–ferrous sulfate shows significantly greater values in the mean hemoglobin and hematocrit levels of the treated group.

It is a pleasure to acknowledge the excellent technical assistance of William Gollihar, Mrs. J. T. Long, Ace Powers, and William Terry.

COAGULATION TIME AND PROTHROMBIC ACTIVITY

Laboratory Tests in Controlling Anticoagulant Therapy

LOUIS S. SMITH, M.D., Dallas, Texas*

THE estimate of prothrombin by present methods is not precise but sufficiently accurate for clinical work. The reporting of "prothrombin time" in seconds does not reflect the true relation of the activity of these substances as there is not a constant relation between the number of seconds required for plasma clotting and the amount of prothrombin-like substances present in the patient's blood. Rather this relation varies at different concentrations and, in addition, may be materially altered in the individual laboratory and between various laboratories according to the thromboplastin and the control patient used as a reference.

When laboratories first began routine prothrombin determinations several years ago, some reported the "per cent of normal" based on the simple calculation of patient's time in seconds divided by control time in seconds. This was erroneous as it assumed a linear relationship between prothrombin and seconds. In actual fact, the relationship forms a curve with the critical portion of the curve placed directly at the level of the therapeutic range. For these reasons more laboratories now are reporting the results in "percentage of prothrombic activity." This is based on constructing the control curve for each new batch of thromboplastin or for any change in laboratory technique and applying the time obtained for each patient to this variable curve. It is intrinsically different from the old report method of "per cent of normal" and easier to use clinically than time in seconds. It is of note that not all of the prothrombin in blood is in an active form and, in addition, factors other than prothrombin may act as prothrombin as determined by present laboratory methods; hence, the term prothrombin time is thus replaced by prothrombic activity.

The normal value of prothrombic activity is 70 to 100 per cent. The therapeutic maintenance level is 15 to 35 per cent. The results are reported from 100 per cent to 10 per cent of prothrombic activity as the nearest multiple of 5 per cent and below 10 per cent of prothrombic activity as "less than 10 per cent."

Vitamin K is (1) formed in the bowel via the flora, for the most part, (2) absorbed by the intestine, and (3) converted to prothrombin by the liver. A defect of any of these steps leads to a decreased prothrombin activity of the blood plasma. Also, caffeine (coffee, tea, cola drinks) will increase the ac-

* *Clinical Pathologist, St. Paul's Hospital.*

tivity, and salicylates (including aspirin) have about one-twentieth the anticoagulant effect of Dicumarol and decrease the activity (lengthen the time).

It follows that a person in need of anticoagulant therapy may already have a low prothrombic activity. Without knowledge of this the physician may prescribe the usual dosage of anticoagulant based on weight and reduce the activity to "less than 10 per cent," subjecting the patient to hematuria or possible fatal cerebral hemorrhage.

No anticoagulant can be prescribed safely without the previous knowledge of the ability of the blood to control hemorrhage.

BEGINNING TREATMENT

Once the prothrombin activity is known, dosage of any of the Dicumarol-like drugs (Dicumarol, Tromexan, Cumopyran, Phenylindanedione, and so forth) is given, according to prothrombic activity, weight, and previous response, if known. As there are wide variations of response, daily estimations of the prothrombic activity are required until the patient is completely stabilized. With the newer trends toward very prolonged therapy (many months and years) the determinations may eventually decrease from daily to every second day, every third day, every fourth day, every fifth day, every week, every ten days, every two weeks, or every month.

The individual response differences are striking at times: normal prothrombic activity in a patient given one average initial dose of anticoagulant may drop to the hemorrhagic level (less than 10 per cent). Exceptional patients bleed in the therapeutic range; hence an occasional urine determination for red blood cells (microscopic examination) and hemoglobin (benzidine and guaiac tests) may be prudently requested. Bleeding practically always appears first in the form of hematuria from Dicumarol-like drugs. On the other hand some patients do not show lowering of prothrombic activity until two to three times the usual dose has been taken.

It is desirable, as a rule, to have anticoagulant effect induced as soon as the diagnosis of thrombosis is made. Some may be misled into a sense of comfort after the dose has been prescribed, yet the thrombus continues to grow until the effect of the drug has reached a satisfactory level. Dicumarol may take two to five days. Tromexan is better at eighteen to twenty-four hours and Cumopyran at twenty-four to thirty-six hours. Phenylindanedione is usually complete in its anticoagulant effect in twenty-four hours. Heparin given intravenously acts immediately. Some workers in the field give heparin intravenously with a Dicumarol-like drug, thus handling both immediate and prolonged requirements of the patient.

Heparin therapy is never controlled with determinations of prothrombic activity; though heparin may decrease the activity, it does so sporadically and the relationship is not stoicheiometric. Heparin therapy is controlled only by coagulation time determinations. Dicumarol therapy is controlled only by prothrombic activity determinations.

The patient may have a Lee-White coagulation time determination made immediately upon hospital admission and heparin given intravenously; the effect is immediate. Normal Lee-White coagulation time is five to twelve minutes (depending on the diameter of the tube the laboratory uses, coating with silicone, and so forth). The therapeutic range (with heparin) is two and one-half to three times the normal or a maximum of thirty-six minutes.*

Whereas heparin given intravenously has an immediate anticoagulant effect, this effect lasts only about four to six hours. With heparin given intramuscularly the effect begins within about one hour and lasts four to six hours. Depo-solution heparin lasts eighteen to twenty-four hours. Therapy with heparin as a rule is more expensive than that with Dicumarol-like drugs. However, some claim that vasodilatory and analgesic actions of heparin are valuable side effects.

THERAPEUTIC SCHEME

Manifestly, with the wide choice of modern anticoagulant drugs many schemata are available to the physician according to his desires. An example of one such schema providing both immediate and prolonged therapy would be as follows:

A patient is admitted as an emergency and the diagnosis of myocardial infarction is established. A coagulation time determination (Lee-White) "Stat" and a prothrombic activity test are ordered. The coagulation time is eight minutes and the prothrombic activity is 80 per cent. One hundred mg. of aqueous heparin is administered intravenously immediately and 100 mg. of Depo-solution heparin is given in the buttocks. In addition 150 mg. of Cumopyran is given orally. The first heparin is given to have an immediate effect and last four hours; the second heparin will cover for up to twenty-four hours; by then, the Cumopyran will have taken over. Additional doses of Cumopyran are based on the prothrombic activity determinations, keeping in mind that the second determination may be unduly low because of the irregular and unpredictable depression caused by the doses of heparin. Hence, proportionate larger doses may be offered the second

**The number of tubes used in the Lee-White method varies and is a technical requirement of the method of procedure. It has no bearing on the clinical problem.*

day and the third. Most workers prefer to stabilize the patient onto a single morning dose of oral anticoagulant. For Tromexan the dosage may be 1,200, 900, then 600 mg. daily; some claim greater ease of stabilization and fewer laboratory determinations for this product. Phenylindanedione has a usual initial dose of 200 mg. (divided morning and night), 300 mg. for the patient weighing more than 70 Kg.; the maintenance dose varies from 25 to 100 mg. depending on the laboratory report.

The well known cumulative effect may be observed as a failure of the prothrombic activity to be diminished for a few days even on a presumably adequate dosage of Dicumarol-like drug. It may be tempting for the physician to become impatient and order an overwhelming dosage. Once the response begins there may be a severe depression of the prothrombic activity that has been ascribed to a peculiar reaction on the part of some patients which seems as if a threshold level must be reached before effect is noted. On the other hand some are sensitive, and a small dose goes a long way.

The laboratory report sheet may show the determinations in a saw-toothed pattern indicating that the drug is markedly toxic to the patient's production of prothrombin, but at the same time the patient shows unusual ability later to detoxify the drug. It may be wise in these cases to try another type of anticoagulant. Many saw-toothed patterns have been induced by patients not taking the pills even though the nurse gives the medicine on schedule. One patient denied this accusation while daily the "red pills" were taken out of the wastebasket from her room. Some have hidden them in a purse, drawer, or pillow case or even had a relative take them home. One patient saved them for three days, then took them all at once. Those who advocate heparin claim the advantage of confirmed administration of drug (unless the new heparin linguets are employed). Patient understanding is essential. Some research teams have a physician place the drug in the patient's mouth, then examine the mouth afterwards. The laboratory has been held in error for a sudden rise in prothrombic activity when it was forgotten to withhold coffee from the diet (or at least until the morning blood sample has been drawn). One patient had his wife bring in a large dose of aspirin and the laboratory was held inaccurate for a sudden low percentage. Another was a rheumatic patient on salicylate therapy which was not taken into account.

If the coagulation time is increased to more than thirty-six minutes or the prothrombic activity is "less than 10 per cent," the most prudent course is simply to withhold therapy until the values return to therapeutic range. Examinations of the urine are indicated. In the event that untoward results are expected from such low levels, whole blood may be administered to counteract either heparin or the Dicumarol-like compounds. However, whole blood, as well as the specific anti-anticoagulants, tends to raise the prothrombic activity out of therapeutic range and induce the "swinging of the pendulum" which is exceptionally difficult to stabilize and frequently results in the patient's having been without therapy for a few days before stabilization is reached again.

Vitamin K is the specific drug to combat overdosage of Dicumarol-like compounds. The most positive and predictable results are obtained with the fraction known as vitamin K_1; 10 to 200 mg. may be given intravenously or intramuscularly.

With heparin overdosage, whole blood, protamine sulfate, or toluidine blue may be used in that order of preference. Protamine sulfate in particular is readily available and may be administered intravenously using from 50 to 100 mg.

LOWERING MORTALITY

It is a general feeling that the patient who comes to autopsy from overdosage of drug is the personal responsibility of the physician in charge of the case. Although this is so, this occurrence is so rare as to be almost nonexistent nowadays. Surely the greater error is in the other direction where less than adequate therapy is given or maintained and the patient goes on to die of the "natural course of his disease." In the latter case the physician may feel that he has done all that is possible and releases himself psychologically from responsibility. Several large series of cases suggest that more radical anticoagulant therapy should be used on a broader scale to obtain the minimal mortality rates from certain types of clotting diseases. If anticoagulant therapy is used, it is urged that adequate levels by laboratory control be maintained. The physician may well ask himself whether or not he would want anticoagulant therapy for his own "coronary" and what scheme he would want followed for himself.

Dr. Joseph H. Gast, professor and chairman of the Department of Biochemistry, Baylor University College of Medicine, Houston, Texas, is thanked for his guidance in the preparation of this article.

MUSCULAR DYSTROPHY RESEARCH

A grant of $5,000 was made to Southwest Foundation for Research and Education, San Antonio, by the National Muscular Dystrophy Research Foundation for the project entitled "Individual Metabolic Patterns for Families Having a History of Muscular Dystrophy." Biochemist Roy B. Mefferd is supervising the project.

Physicians wishing moderate grants-in-aid may apply to the executive secretary of the foundation, 709 Main Street, Liberty, Texas, announces Dr. A. L. Delaney, Liberty, president.

CASE REPORTS

EXTREME SUPRAVENTRICULAR TACHYCARDIAS IN INFANCY

Etiologic Factors and Report of a Case Associated with Rhabdomyomas of the Heart and Sepsis

M. F. GRAHAM, M. D., Dallas, Texas

SINCE Hubbard's comprehensive review of the syndrome of paroxysmal tachycardia in young infants,[7] the literature has become replete with case reports pertinent to the subject. No less than 65 case references, many of them in foreign literature, were encountered in the preparation of this paper. The following case will serve to focus attention on the possible role of infection and especially of primary cardiac lesions in the extreme supraventricular tachycardias of infancy.

CASE REPORT

Baby A. was the product of a normal nine months' gestation in a gravida 4, para 3 mother. She presented as a frank breech, delivery was spontaneous and uncomplicated, and the infant was apparently normal at birth. The obstetrician had observed no fetal tachycardia. The baby weighed 2,976 Gm. at birth, and the temperature shortly after delivery was 99 F. by rectum. Shortly before I first saw the infant, she became mildly cyanotic and was placed in oxygen in an incubator. When I saw her first, about twelve hours after delivery, she was slightly cyanotic even in oxygen. Though rather lethargic, she responded well to stimuli.

The pertinent findings on physical examination were a rapid, shallow, rather irregular respiration, and a heart rate in excess of 200 beats per minute (accurate count not possible) with a regular rhythm. No thrills or murmurs were present. No abnormalities in either lung field were noted on percussion or auscultation. The abdomen was slightly distended with gas, with no masses or resistance to palpation notable. The neuromuscular reflexes were normal for a newborn infant, and the anterior fontanel was not tense or bulging. Skin turgor was good. Genitalia were not remarkable. There was a slightly raised, 2 by 3 cm., light-reddish nevus on the volar aspect of the left forearm.

Lumbar puncture was attempted on two different occasions, but gross blood (thought to be of traumatic origin) was obtained each time. A digitoxin preparation (Crystodigin, Lilly), 0.02 mg., was given orally, to be repeated every six hours for four doses. Lactose water was started orally in small amounts. When she was seen later that day, the general condition of the infant was thought to have improved somewhat. Oblique and anteroposterior films of the chest with barium in the esophagus, on the second day of life, revealed no evidence of cardiac enlargement, no abnormality of the heart and great vessels, and clear lung fields. An electrocardiogram made at that time revealed right axis deviation, supraventricular tachycardia with auricular and ventricular rates of 300, P waves absent, and a QRS interval of 0.04 second. S_1 was deep and tall R waves were present in leads V_1 and V_2. "Saw-toothed" waves were noted in V_2. The electrocardiographic interpretation was supraventricular tachycardia with possible 1:1 flutter.

Toward the end of the second day of life the baby began to regurgitate and the extreme tachycardia persisted; 0.02 mg. of Crystodigin were administered intravenously, and the baby was transferred to a hospital for sick infants. At no time during the forty-eight hour stay in the hospital of birth was the infant febrile.

Upon admission to the second hospital (about one hour after the intravenous Crystodigin) the cardiac rate was noted to be about 190, with regular rhythm. No murmurs or thrills were present, and the heart was not enlarged on physical examination. Cyanosis was moderate. The lung fields were clear. The liver edge was palpable about 1 cm. below the right costal margin, but no edema was noted. The neck was supple, and the anterior fontanel was not under pressure. The cry was suggestively shrill.

Admission laboratory work, including a complete blood count and urinalysis, revealed no abnormalities except 3 plus albuminuria.

On the morning after admission the heart rate was 120; the patient was acyanotic and appeared well. Temperature was 100 F. by rectum. For the following forty-eight hours the patient continued to progress favorably, took feedings eagerly, and was removed from oxygen completely toward the end of that time. The temperature ranged from 98 to 102.8 F. by rectum. Maintenance doses of Crystodigin, 0.01 to 0.02 mg. orally, and prophylactic penicillin, 400,000 units intramuscularly, were given daily.

On the fourth hospital day the patient suddenly had a right-sided convulsion of about one minute's duration, and bright, frothy blood appeared at the mouth. The eyes deviated to the right, and the right fist was clenched tightly. Abdominal distention became marked, and the liver was thought to have descended 3 cm. below the right costal margin. The spleen was not palpable. The heart rate was 140, and chest examination revealed no abnormalities except decreased breath sounds in the left base. There were no rales. Neither edema nor cyanosis was present, but

From the Department of Pediatrics, Southwestern Medical School of the University of Texas.

ecchymoses appeared in rapid succession on the extremities, chest, and buttocks. There were no petechiae, and a tourniquet test was reported negative. With subsidence of fever (rose to 102 F. by rectum at onset of the attack), the patient experienced another convulsive seizure, associated with laryngospasm and cyanosis. The extremities were observed to be tonically extended, the feet plantar-flexed, and the fists clenched. More ecchymoses developed, and gross bleeding from the nose and mouth appeared afresh. Gross blood was obtained on attempted spinal tap.

Shortly after onset of the first convulsive episode, blood specimens were drawn for culture and other laboratory procedures, including typing and crossmatching preparatory transfusion, and a calcium preparation,* vitamin K, and Aureomycin were administered intravenously. Laboratory data revealed a bleeding time in excess of fourteen minutes and a Lee-White clotting time of nine minutes. Prothrombin time was 100 per cent of normal. Before further studies could be carried out, the patient died.

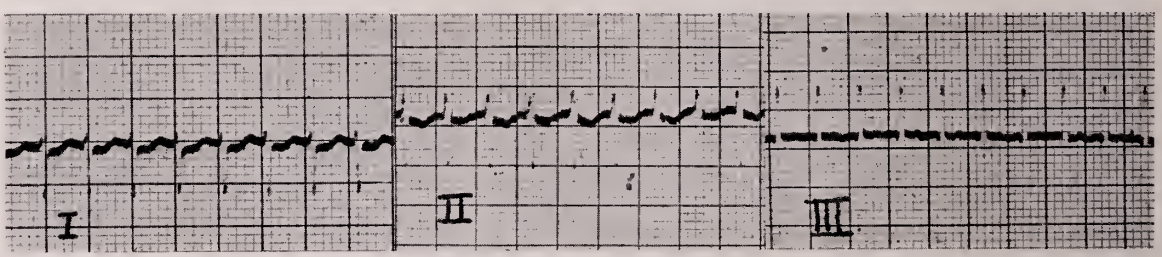

FIG. 1. Standard lead tracings on the second day of life. (See text for full electrocardiographic interpretation.)

Autopsy Findings.—The pertinent findings at necropsy were small petechiae over the moderately protuberant abdomen and extensive ecchymoses of the trunk and extremities.

The brain was markedly edematous and bulged out of the cranial vault. A greenish-yellow, plastic exudate was present in the subarachnoid space over the dorsolateral surfaces of the cerebral hemispheres and at the base. Microscopically there were scattered petechiae within the brain substance. Pseudomonas aeruginosa and Aerobacter aerogenes (thought to be contaminants) were cultured from the spinal fluid, although one broth culture of meningeal exudate cultured at autopsy yielded gram-positive cocci in chains on a stained smear only.

The adrenal glands were diffusely hemorrhagic, the microscopic detail being obliterated by hemorrhagic necrosis (Waterhouse-Friderichsen syndrome).

The heart weighed 20 Gm. and presented on its anterior surface a flattened, plaquelike area of soft grayish-white tissue, 1 cm. in diameter and 3 to 4 mm. thick, together with two smaller grayish-white nodules on the epicardial surface near the apex of the heart. The myocardium was somewhat flabby and a pale brownish-red. The foramen ovale could be probed but was closed by a thin fibrous flap. Multiple sections showed multiple, varying-sized areas of vacuolated, so-called spider cells arranged in small ovoid-shaped groups scattered throughout the thickness of the myocardium and in the trabeculae carnae as well. Microscopically a moderate degree of myocardial hypertrophy was noted. The lungs were not fully aerated, and gross examination revealed large areas of intraparenchymal hemorrhage. Fibrin was deposited over the pleural surfaces of the upper and lower lobes of the right lung. Microscopic sections of the right lung showed small foci of pneumonic consolidation associated with the presence of numerous large foamy macrophages and purulent exudate within the lumens of the small bronchi.

Given, after due consideration, with complete awareness of its potential hazards in a digitalized patient.

DEFINITION

The term "supraventricular tachycardia"[8] encompasses any tachycardia in which the impulses arise in the auricles or above the bundle of His. The term "extreme supraventricular tachycardia" (rates of around 200 or more in the infant) is used here to designate a supraventricular tachycardia other than one of simple sino-auricular nodal origin.

The extreme supraventricular tachycardias of infancy include more especially paroxysmal auricular tachycardia and auricular flutter, the accurate differential diagnosis of which is not always possible, even with the aid of electrocardiography.

ETIOLOGY

Etiologically, the extreme supraventricular tachycardias of infancy lend themselves to classification as follows:

I. Primary (idiopathic, functional, spontaneous)—due to autonomic dysfunction.[1, 3]
II. Secondary.
  A. Due to infection involving organs other than the heart (systemic or remote infections).
  B. Due to lesions confined to the heart.
    1. Inflammatory lesions of the heart.[15]
    2. Tumors of the heart
      a. Sino-auricular nodal tumors.[13]
      b. Rhabdomyomas.
    3. Structural abnormalities (congenital heart disease).
    4. Idiopathic cardiac hypertrophy.[1]
  C. Due to anesthesia.[13]
  D. Due to trauma—skull fracture.[18]

In a review of any phase of the subject of extreme supraventricular tachycardias in infancy, one cannot help being impressed by the fact that the majority of cases are not associated with any demonstrable organic disease (primary or idiopathic). However, the simultaneous occurrence of infection with those tachycardias is too frequent to be mere coincidence. Noteworthy is the fact that a dozen or so varieties of infectious disorders have been found associated with tachycardias in infants under 1 year of age.[4, 6, 7, 10, 12, 14, 16, 19] In a given in-

fant, many different types of infection may act as incitants to tachycardia.[4]

The case here presented is thought to be the third reported case[5, 18] of rhabdomyoma of the heart associated with tachycardia in infancy, up to the time of Crowell and Rice's report.[5] One other case[17] presented an arrhythmia "of a type presenting the potential hazard of auricular tachycardia." Miller[11] more recently pointed to the possible association of congenital rhabdomyoma of the heart with arrhythmia, noting the cases referred to by Crowell and Rice and mentioning one of his own. According to Crowell and Rice's review of the subject, only 69 cases of congenital rhabdomyoma of the heart were available in the literature as of January, 1950, with 55 per cent of these occurring in infants less than 1 year of age.

FIG. 2. The heart opened at autopsy. On the right, at least three plaquelike masses are seen on the epicardial surface. These are the larger rhabdomyomas.

It is generally conceded that in order for rhabdomyomas of the heart to be implicated in tachycardia, they must either involve the conducting system, afford an aberrant communication between auricle and ventricle, or serve as an ectopic focus.

Among the known cases of tachycardia associated with congenital rhabdomyomas, Wegman and Egbert's case[18] showed an auriculoventricular bundle "obliterated by tumours." In Crowell and Rice's case,[5] 3 tumor masses were found, involving the interventricular septum, the left ventricular wall, and the posterior edge of the mitral valve. Sussman and Stasney's case,[17] associated with arrhythmia presenting "the hazard of auricular tachycardia," had "several nodules in the heart," the "largest in the right atrium." In the case here presented the conducting system was definitely involved both above and below the bundle of His by small nodules. The large nodules did not involve the conducting tissue.

Despite the contention of some[5] that congenital rhabdomyomas of the heart are of little clinical significance, it seems striking that in all reported cases of these tumors in which electrocardiography was done, arrhythmias were associated.[11] It is true that there is little which is distinctive insofar as the clinical picture presented by congenital rhabdomyomas of the heart is concerned, but the possibility of such a lesion should always be entertained in the differential diagnosis of the infantile arrhythmias, especially if otherwise unexplained cardiomegaly is present in the absence of cyanosis. However, cyanosis may be present. Murmurs are rare unless the lesions are present on the valve leaflets. One feature which might be of indirect assistance in suspecting the lesion is the frequent coexistence of other conditions, notably tuberous sclerosis; brain tumors; harelip; cleft palate; cysts and tumors of the kidney; congenital malformations of the pancreas, kidneys, and lungs; and tumors of the skin.[2, 5, 18] Obviously many of these lesions are in themselves difficult to recognize clinically, especially in infancy. This case presented a nevus of the left forearm.

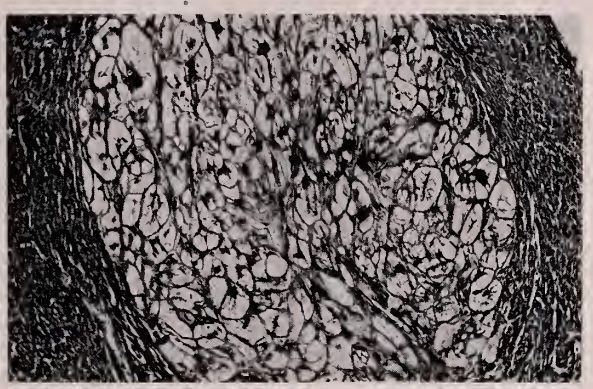

FIG. 3. A small microscopic focus illustrating the typical vacuolated or "spider-cell" appearance of an ovoid-shaped cell mass. (Such foci not recognized in the gross were seen on section to be scattered throughout the thickness of the myocardium.)

Congenital heart disease as a possible etiologic factor in extreme supraventricular tachycardia in infancy is found fairly frequently in reference material.[5, 13, 20] Levine,[9] reviewing the literature and inquiring of hospitals and doctors in the Los Angeles area, obtained information on some 100 cases of paroxysmal tachycardia in infancy and found associated congenital heart disease in less than 10 per cent.

COMMENT

The case here presented is representative of the secondary type of infantile tachycardia, being asso-

ciated with both infection and primary lesions of the heart. It is of interest to note that the tachycardia apparently responded to digitalis treatment, even in the presence of both factors. The infection, apparently suppressed earlier by antibiotic therapy, was fulminant in its terminal manifestations. It was probably present at birth. Fever, seen in this infant, is a common accompaniment of extreme tachycardia in infants. Especially in the absence of failure, however, one should be extremely hesitant to ascribe its presence to the tachycardia until an exhaustive search has been made for infection, even though, as in this instance, the infant shows dramatic improvement following relief of the tachycardia. It is not possible to say decidedly that the infection in this infant played a causative role in the tachycardia, especially since tumors of the heart were coexistent. Its presence can only be pointed out. However, it is believed that the tumors in this infant's heart, located as they were, were definitely instrumental in producing the tachycardia. It is noteworthy that cardiomegaly was not a feature of this case.

SUMMARY

A case of extreme supraventricular tachycardia in a newborn infant, associated with sepsis and rhabdomyomas of the heart is presented.

The role of infection, and of certain primary cardiac lesions in the extreme supraventricular tachycardias of infancy is reviewed briefly.

The author wishes to recognize the valuable assistance of Dr. R. L. Moore as consultant in this case, and to express his appreciation to Drs. Gilbert Forbes, professor of pediatrics, and R. L. Moore for their helpful criticism in the preparation of this paper and to Dr. Alice Smith for her preparation of the pathologic data.

PERNICIOUS ANEMIA TREATMENT

By the administration of vitamin B_{12} through inhalation or use of a nasal spray pernicious anemia can be treated effectively and inexpensively, Dr. Raymond W. Monto and Dr. John W. Rebuck, Detroit, report in the February *Archives of Internal Medicine.*

The doctors state that 12 patients who had a return of the disease after its apparent cessation were successfully treated by this method, and in 20 other patients the symptoms of the disease were held in abatement for periods up to eighteen months with the same treatment. The doctors point out that this method of therapy has produced no evidence of toxicity or sensitivity.

DOCTORS IN SERVICE

Results of the first year's survey of physicians leaving active military service have been issued by the American Medical Association's Council on National Emergency Medical Service. A total of 3,948 questionnaires completed between July 15, 1952, and August 1, 1953, shows that the average time spent in the service was 24.7 months. The survey also indicates that the average tour of duty in the United States was 7.6 months and the average tour of foreign duty was 17.1 months. Fifty-one per cent felt that staffing was adequate, and 29 per cent felt there was overstaffing. Of the physicians assigned to domestic duty, 53.4 per cent were engaged in treating military personnel, 28.3 per cent in treating military dependents, and 18.3 per cent in treating "other." Of those assigned to overseas duty, 51.8 per cent treated military personnel, 23.8 per cent treated dependents of military personnel, and 24.4 per cent treated "other."

Questions regarding the type of medical care provided for other than military personnel revealed that in the Army and Navy the most frequent type was outpatient care, and in the Air Force the most frequent type of care was in the field of obstetrics and gynecology.

The doctors answering the survey believed that the national and local medical associations could better serve their members in the service by personal visits by civilian doctors to evaluate grievances, invitation of military doctors to civilian medical meetings, assistance in locating positions after discharge, assistance in preventing evasion of military service, distribution of questionnaires to physicians in the service, and provision of specialists for clinical conferences.

Asterol Encephalopathy

MORRIS WILLIAM ROSENTHAL,* M. D., and ROBERT J. GOODALL,† M. D.,
Houston, Texas

TREATMENT of fungus infections of the skin and scalp with a new compound, Asterol dihydrochloride (2-dimethylamino-6-[beta diethylaminoethoxy]-benzothiazole dihydrochloride) was first reported in 1951.[1, 2, 7]

Initial accounts were promising,[1, 2, 6, 7] and the effectiveness of the drug fairly well established. However, reports since 1952[3, 4, 5, 8] have indicated that in infants and young children there may occur toxic manifestations which preclude the advisability of the use of Asterol in this age group. It should be pointed out that the manufacturers of this product clearly indicate on the containers that "Asterol should not be used in infants."

CASE REPORT

A 7 week old white boy was admitted to the hospital June 26, 1953, at 2 a. m. with generalized convulsive seizures which had begun about 10:30 p. m. the preceding evening. The infant had been treated for a diaper rash appearing to be of fungus origin with Asterol dihydrochloride powder for the previous six days. Treatment had been conscientious, and the rash was almost entirely cleared on admission of the patient to the hospital.

Prior to admission the patient had four distinct generalized convulsive seizures. These were described as being of sudden onset, both tonic and clonic, involving first the face and then the extremities and trunk, and lasting about two minutes each. There were no other difficulties and no preceding fever, infection, or trauma. On admission, the patient appeared acutely ill, with temperature normal. The head circumference was 37 cm.; the chest at the nipples and at the eighth rib was 35 cm. The anterior fontanel was soft and slightly depressed. The neck was supple; pupils were slightly dilated and reacted rather sluggishly to light. Examination of the ears, nose, and throat was negative. The lungs were noted to have a few wet coarse rhonchi throughout. Examination of the abdomen was negative. Skin examination revealed the clearing, dry, and scaling intercrural rash. Neurologic examination elicited hypoactive knee jerks but was otherwise physiologic.

Laboratory work revealed a normal hemogram and normal urinalysis. Analysis of fluid from a lumbar puncture was reported as yielding 4 cells, 3 lymphocytes and 1 polymorphonuclear leukocyte; 65 mg. of sugar per 100 cc.; 186 mg. of chlorides per 100 cc.; and 125 mg. of total protein. On June 27 the serum calcium level was reported as 5.75 mg. per 100 cc. Roentgenograms of the skull and chest were reported as completely negative. Bilateral subdural taps on June 27 were normal.

The patient continued to convulse at intervals after admission and was placed on phenobarbital by mouth and hypodermic injection as required for control. About six hours after admission generalized hyperreflexia became evident. Seizures continued at varying intervals even after administration of phenobarbital and were precipitated frequently by handling, feeding, and other disturbances. Temperature remained normal throughout the period of hospitalization.

On July 2, while the patient still was having episodes of convulsions, an electroencephalogram was obtained by Dr. John Skogland, which was reported as follows: A tracing was made with 12 scalp and 2 ear (reference) electrodes. Although the patient was given no sedative, he fell asleep. Adequate examination was carried out with the infant both awake and asleep. Awake, all leads showed a considerable amount of low voltage fast activity (approximately 20 to 24 waves per second) but with 5 to 7 per second waves and occasional 1 to 2 per second base line undulations intermixed in random fashion. Asleep, all leads at first showed chiefly 3 to 6 per second waves intermixed with much low voltage fast activity. In deeper sleep, irregular 2 to 4 per second high voltage waves appeared in addition to 5 to 7 per second moderate voltage waves and some low voltage fast activity (approximately 20 waves per second). Neither awake nor asleep were there any waves which were definitely pathologic. Impression—normal electroencephalogram for this age.

On July 1, six days after onset, the seizures became less frequent and less severe, and on July 2 the last seizure occurred. There has been no recurrence of seizures since, even after phenobarbital was discontinued completely on July 4.

A repeat lumbar puncture on July 1 was reported as revealing 1 cell (lymphocyte); sugar 59 mg. per 100 cc.; chloride 120 mg. per 100 cc.; protein 40 mg. per 100 cc. A recheck neurologic examination July 29 was completely negative.

DISCUSSION

A total of 6 reported cases in which toxic encephalitis has occurred with or following the use of Asterol dihydrochloride[3, 4, 5, 8] have been found in the literature. In all cases no other cause could be attributed and recovery was complete after cessation of the drug. Manifestations have consisted of convulsions, visual hallucinations, delirium, muscular weakness, and ataxia alone or in combination. In all cases tremors or convulsions were evident, and in those children above infancy, psychic disturbances as well were manifest, a fact which seems to indicate the generalized toxicity of the drug.

Age range of cases previously reported has been 10 weeks to 4 years. Symptoms have commenced not earlier than seven days and in one case as long as fifty-three days after beginning Asterol medication and have subsided in three to seven days after the drug was discontinued. All laboratory examinations, including spinal fluid studies, were usually

*Resident in Pediatrics, Baylor University.
†Associate Neurosurgeon, St. Joseph's Hospital.

within normal limits in all cases. The elevation of the spinal fluid protein and chloride levels in our case was an interesting finding, but we think not incompatible with a diagnosis of Asterol intoxication. Electroencephalographic changes were found in the 2 cases in which this examination was done; they reverted to normal by the seventh day after discontinuation of the drug.

It has been estimated vaguely that 1 in 1,000 children of all ages receiving treatment with Asterol is susceptible to toxic manifestations,[8] and the literature seems to bear out the fact that the younger the patient the more likelihood of toxicity.

SUMMARY

Another case of apparent Asterol intoxication encephalopathy is reported, this in a 7 week old white boy in whom the pattern of illness follows closely that of previous cases described. Onset of convulsions occurred on the seventh day of treatment and recovery was apparent on the seventh day following discontinuation of the drug with management consisting only of measures to control symptoms.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Secy.

American Heart Association

Chosen as a director-at-large on the board of directors of the American Heart Association for a two-year term was Dr. George R. Herrmann, professor of medicine at the University of Texas Medical Branch, Galveston. Dr. Herrmann was elected at the thirtieth annual meeting of the American Heart Association held in Chicago, April 1-4.

Dr. Alfred W. Harris, Dallas, was elected to represent the Section on Clinical Cardiology; Dr. Paul V. Ledbetter, Houston, will represent the Scientific Council; and Dr. Edgar M. McPeak, Houston, will represent the Council on Community Service and Education. All three will serve one-year terms.

Members of the Texas Medical Association who previously were elected to represent the Texas Heart Association on the national assembly for two-year terms include Dr. Robert M. Barton, Dr. Merritt B. Whitten, and Dr. Henry M. Winans, Dallas; Dr. J. C. Crager, Beaumont; Dr. Herrmann; Dr. Charles C. Stone, Galveston; Dr. Joseph F. McVeigh, Fort Worth; Dr. Ledbetter; Dr. Joseph Kopecky, San Antonio; Dr. George W. Parson, Texarkana; Dr. Kleberg Eckhardt, Corpus Christi; Dr. Victor E. Schulze, San Angelo; and Dr. Walter B. Whiting, Wichita Falls.

Texas doctors attending the Chicago meeting as alternate delegates were Dr. Harris; Dr. Robert E. Leslie, El Campo; Dr. Malcolm H. Wyatt, Pampa, and Dr. McPeak.

Dr. McVeigh, president of the Texas Heart Association, and Dr. Herrmann, president-elect, were among the honor guests at a special dinner for presidents of affiliated heart associations at the convention. Speakers at the dinner were former Vice-President Alben W. Barkley and Mrs. Barkley, who is a vice-president of the American Heart Association.

Surgeons Regional Meetings

The Rocky Mountain Division of the United States Section of the International College of Surgeons will have a regional meeting in Salt Lake City, Utah, July 22 and 23, under the chairmanship of Dr. N. Frederick Hicken of Salt Lake City.

AMA Headquarters Visitors

The number of physicians and medical society executives touring American Medical Association headquarters during 1953 more than doubled the number in 1952. All out-of-town physicians visiting in Chicago are invited to tour the AMA building.

NATIONAL MEETINGS

The third annual *Symposium on Tuberculosis and Other Chronic Pulmonary Diseases for General Practitioners* will be at Saranac Lake, N. Y., July 12-16. Additional information about this meeting, which is approved by the American Academy of General Practice for twenty-six hours of formal credit, may be obtained from Dr. Richard P. Bellaire, Chest Disease Symposium, P. O. Box 2, Saranac Lake.

The thirty-second annual scientific and clinical session of the *American Congress of Physical Medicine and Rehabilitation* will be held September 6-11 at Washington, D. C. Sessions will be open to members of the American Medical Association. Full information may be obtained by writing to the executive offices, American Congress of Physical Medicine and Rehabilitation, 30 North Michigan Avenue, Chicago 2.

The program of the first annual meeting of the *Academy of Psychosomatic Medicine,* which will be held in New York, October 8-9, will be on the psychosomatic aspects of surgery. Those interested in presenting papers should write to Dr. Benjamin Raginsky, 376 Redfern Avenue, Montreal, Canada. Applications for fellowships and associationships in the academy should be sent to Dr. Ethan Allan Brown, Secretary, 75 Bay State Road, Boston 15.

The Inter-Society Cytology Council will meet in Boston, November 12-13. Those wishing to present papers should contact Dr. John B. Graham, Chairman of the Program Committee, 32 Fruit Street, Boston, before July 15. For additional information about the meeting contact the Secretary-Treasurer, Inter-Society Cytology Council, 634 North Grand Boulevard, St. Louis.

INTERNATIONAL MEETINGS

The Pan American Association of Ophthalmology will meet June 17-21 for its third Interim Congress in Sao Paulo, Brazil. Scientific papers will be presented by doctors from the United States, Canada, Central America, and South America. Meetings at the same time in Sao Paulo will be the eighth Brazilian Congress of Ophthalmology and the nineteenth International Congress of Oto-Neuro-Ophthalmology. Physicians are invited to all of the scientific meetings. Additional information may be obtained from Lois Stice, 2 East 103 Street, New York 29.

The Third International Poliomyelitis Conference will be September 6-10 in Rome. The National Foundation for Infantile Paralysis is one of the sponsors. Additional information is available from the Secretariate of the Third International Poliomyelitis Conference, 6 via Lucullo, Rome, Italy.

The Pan-Pacific Surgical Association meeting will be held October 7 and 8 in Honolulu. All doctors are invited to attend. Further information may be obtained from Dr. F. J. Pinkerton, Director General, Pan-Pacific Surgical Association, Suite Seven, Young Building, Honolulu, T. H.

AMERICAN COLLEGE OF CARDIOLOGY

Three members of the Texas Medical Association will receive fellowships in the American College of Cardiology at a convocation scheduled for May 28 in Chicago. They are Dr. Albert P. Sparr, Vernon; Dr. Alexander Axelrod, Houston; and Dr. Clive R. Johnson, Fort Worth.

Members of the Association who were admitted previously to the American College of Cardiology are Dr. Olin B. Gober, Temple; Dr. Franz V. Grunbaum, Houston; Dr. Conrad C. McDonald, Tyler; Dr. Neill Simpson, Waco; Dr. Frederick W. Steinberg, San Antonio; Dr. James B. Stubbs, Galveston; and Dr. W. H. Wheir, Amarillo.

Texas Tuberculosis Association

Officers elected at the forty-fourth annual meeting of the Texas Tuberculosis Association held April 9-10 at Dallas are Mrs. Joella Terrill Butler, Wichita Falls, president; Arthur G. Schroeder, Victoria, first vice-president; Dr. Elliott Mendenhall, Dallas, second vice-president; J. W. Butler, Houston, secretary; Dr. Z. T. Scott, Austin, treasurer; and Dr. Robert B. Morrison, Austin, assistant treasurer.

Other members on the executive committee include Dr. David McCullough, Kerrville; Dr. W. D. Anderson, San Angelo; Dr. John W. Middleton, Galveston; Mrs. Arturo Flores, Eagle Pass; and Joe Bogel, Port Arthur. The entire executive committee will serve until April, 1955, when the next annual meeting of the organization will be held in Galveston.

Participants in the program include the following members of the Texas Medical Association: Dr. James A. Bethea and Dr. J. Edward Johnson, Austin; Dr. John S. Chapman and Dr. J. E. Miller, Dallas; Dr. Ralph E. Gray, Lake Jackson; Dr. Henry R. Hoskins, San Antonio; Dr. Thomas R. Jones and Dr. Austin E. Hill, Houston; Dr. John W. Middleton, Dr. Theodore C. Panos, and Dr. Caroline W. Rowe, Galveston; and Dr. Samuel Topperman and Dr. C. B. Young, Tyler.

Dr. Esmond R. Long, Philadelphia, director of medical research for the National Tuberculosis Association, spoke twice to the group. His subjects were "The Tuberculosis Research Program Supported by the Christmas Seal" and "Some Basic Consideration in the Chemotherapy of Tuberculosis."

The Texas Trudeau Society, meeting with the Texas Tuberculosis Society, elected Dr. John W. Middleton, Galveston, president. Other officers elected are Dr. John Chapman, Dallas, vice-president; Dr. S. J. Greer, San Antonio, secretary-treasurer; and Dr. Elliott Mendenhall, Dallas, member of the advisory board to the American Trudeau Society.

SOUTHWESTERN MEDICAL SCHOOL

Southwestern Medical School of the University of Texas has recently been awarded $21,654 in grants from the United States Public Health Service, National Institute of Health. These grants are for research in adrenal steroids on acid-base equilibrium, with Dr. Donald Seldin as principal investigator; for research on effect of experimental neurosis of gastric activity, with Dr. Alvin Shapiro as principal investigator; for research on plasma disappearance curves in experimental hypertension in dogs, with Dr. John Vanatta as principal investigator; and for research in pharmacology on Mannich bases and their quaternary derivitatives, with Myron Slomka, Ph. D., as principal investigator.

Dr. A. I. Brande will be the principal investigator for research on the factors responsible for the toxic and lethal effects of bacterial endotoxins. A United States Army contract reimbursable to a maximum of $18,400 was received for this research.

Dr. Allen Reid has been awarded a $5,000 grant by the American Cancer Society for investigation of the relationship of a naturally occurring metabolic inhibitor to the cancerous state.

Recent guest lecturers at Southwestern Medical School included Dr. Charles H. Best, University of Toronto; Dr. Priscilla White, Tufts College Medical School; Dr. Robert F. Pitts, Cornell University Medical College; Dr. Henry W. Brosin, University of Pittsburgh School of Medicine; Dr. Robert Good, University of Minnesota Medical School; and Dr. Robert Aldrich, University of Oregon Medical School.

PERSONALS

Dr. James McCraine, Dallas, was one of the fourteen named recently by Governor Allan Shivers to compose an advisory committee to survey Texas facilities for mental health care. After studying the facilities and programs now available in the state for research and training in mental health problems, the committee is to make recommendations on the situation.

Dr. Harry M. Little, Houston, spoke on "What a Guidance Center Does, and What You Can Do for It" at the third annual meeting of the Austin Community Guidance Center on March 1. Dr. Little is director of the Houston Guidance Center.

Dr. G. B. Stephenson, Beaumont, was recently presented a ten-year service pin and scroll at a meeting of the Jefferson County chapter of the National Foundation for Infantile Paralysis. Dr. Stephenson has been chairman of the chapter's medical advisory board continuously since 1941 with the exception of three years he spent in the Navy.

Dr. John G. Young, professor of clinical pediatrics at Southwestern Medical School of the University of Texas, Dallas, spoke at Abilene Christian College's 1954 Bible Lectureship.

Dr. B. A. Hallum, winner of the Brady Junior Chamber of Commerce "outstanding young man of the year" award, missed the breakfast at which he was to be presented the official scroll and gold key when an early morning emergency called him away. He received the award later.

Dr. James Hook's mother died March 5. Dr. Hook is from Fort Worth.

Dr. Julian Wilson O'Bryant and Miss Eloise Chain were married on February 21 in Texas City.

Dr. and Mrs. Terrill M. Trimble, Fort Worth, are parents of a boy, Charles Thomas, born March 16. Also parents of a son, born February 1, are *Dr. and Mrs. J. J. Martinez,* San Antonio.

New parents in Houston, as announced by the *Bulletin* of Woman's Auxiliary to Harris County Medical Society, are *Dr. and Mrs. Thomas Kennerly, Dr. and Mrs. Clarence Kaiser,* and *Dr. and Mrs. George Eden.*

According to the *Alumni Bulletin,* University of Texas Medical Branch, Galveston, *Dr. and Mrs. W. B. Neely,* Bellville, are parents of a boy, born January 28. Girls were born to *Dr. and Mrs. J. R. Whitehurst,* Houston, February 6; *Dr. and Mrs. J. H. Childers,* Galveston, March 7; and *Dr. and Mrs. G. W. Apple,* Plano, February 8.

MENTAL HEALTH MEETING

The Texas Society for Mental Health met in Waco March 4-6 and installed Charles N. Burrows, Ph. D., San Antonio, president. Dr. Abe Hauser, Houston, is president-elect. Immediate past president of the society is Mrs. Frank Schoonover, Fort Worth.

Plans for a campaign for members during Mental Health Week were made, and a detailed report of the studies that are being made of the care of the mentally ill was made.

Members of the Texas Medical Association and its Woman's Auxiliary who are on the Board of Directors of the Texas Society for Mental Health are Dr. Titus Harris, Galveston; Dr. Harry M. Little, Houston; Dr. R. C. Rowell, Terrell; Dr. John C. Rucker, Jacksonville; Mrs. Robert F. Thompson and Mrs. George Turner, both of El Paso; and Mrs. E. C. Winkelmann, San Angelo.

The next annual conference of the society will be in Mineral Wells.

TEXANS PLACE IN AAPS ESSAY CONTEST

Two Texas high school students were among the six national winners of the essay contest sponsored this year by the Association of American Physicians and Surgeons. David Curry, El Paso, second place state winner, presented the third place essay, and Kate Wood, El Campo, third place Texas winner, was author of the sixth best paper on "Why the Private Practice of Medicine Furnishes This Country with the Finest Medical Care." Mr. Curry won $100 and Miss Wood $25 as national prizes.

The contest in Texas was sponsored by the Woman's Auxiliary to the Texas Medical Association and was entered by 866 students. The Association donated $1,000 in state and district prizes, and $2,865 was given on the county level by local societies.

Dr. Mal Rumph, Fort Worth, was chairman of the 1954 national contest committee of the Association of American Physicians and Surgeons, and Dr. Charles D. Reece and Dr. Hampton C. Robinson, Houston, were members of the committee. Mrs. A. O. Severance, San Antonio, was chairman of the Auxiliary essay contest committee.

The other national winners are Robert Taylor, Silver City, N. C., first place; Beverly Tarver, San Marino, Calif., second place; Ronald Williams, Winston-Salem, N. C., fourth place; and Frances Thomson, Lake Charles, La., fifth place.

Last year two Texans also were national winners. Janice Hazelwood, Palestine, won $500 as second prize in the national contest, and Joan Carlisle, Henderson, received $250 for the third best essay in the national competition. Miss Hazelwood and Miss Carlisle were the first and second place state winners respectively. The first prize nationally went to Johanna Randall, Los Angeles, in 1953.

The subject for the 1955 competition is "The Advantages of Private Medical Care" and is again being sponsored in Texas by the Woman's Auxiliary.

UNIVERSITY OF TEXAS MEDICAL BRANCH

The Medical Branch of the University of Texas was the first host in the Southwest to the American Association of Anatomists, which met in Galveston April 7-9. The Tissue Culture Club of America met in Galveston, April 5-6.

The American Association of Plastic Surgeons met in Galveston April 21-23. Examinations by the Board of Plastic Surgeons were given to surgeons in the Galveston area preceding the meeting.

The Texas Medical Record Librarians met in Galveston on March 13.

"Medical Psychological Team Work in Care of the Chronically Ill" was the subject of a joint conference with the Josiah H. Macy Foundation of New York, in Galveston, March 30-31.

Dr. Edgar J. Poth, professor of surgery, will present a paper at the fifty-third annual meeting of the American Proctologic Society to be in Los Angeles, June 2-5.

Recent visitors to the Medical Branch were Dr. Lawrence S. Kubie, professor of psychiatry, Yale University School of Medicine, New Haven, Conn.; Hugh Clark, Ph. D., professor of embryology, University of Connecticut; Dr. Herman Lehmann, St. Bartholomew's Hospital and Bart's Medical School, London; and Dr. Eric Odgen, professor of physiology, Ohio State University, Columbus.

Postgraduate Course

The University of Texas Postgraduate School of Medicine will give a course on "The Use of Isotopes in the Clinical Practice of Medicine" June 1-4 from 7 to 9 p.m. in the Auditorium of the M. D. Anderson Hospital and Tumor Institute, Texas Medical Center, Houston. Members of the Academy of General Practice will receive eight credit hours of formal training for attending the course. A lecture on "Medical Applications of Radioisotopes" will begin the program, and other subjects included will be "Use of Radioactive Iodine" and "Uses of Radioactive Colloidal Gold."

LIBRARY SECTION

POLIOMYELITIS

The recent widespread public interest in the role of immunotherapeutic procedures in poliomyelitis makes it essential for physicians to be aware of the uses and limitations of such agents. The gamma globulin fraction from pooled human blood serums has been shown to exert some ameliorating effect upon the degree of paralysis if administered at an interval of approximately five days prior to the onset of symptoms of poliomyelitis. Gamma globulin apparently has no beneficial effect if administered after the onset of symptoms of the disease. It should be borne in mind that globulin prepared from human placental extract exerts no beneficial effect whatsoever in lessening the extent of paralysis. The limitation of supply of gamma globulin precludes the use of mass prophylaxis with this agent in the face of an epidemic except in a restricted locality.

The ultimate answer to the problem of poliomyelitis is to develop a method of active immunization against the different strains of viruses encountered throughout the United States and neighboring countries.

The vaccine developed by Dr. J. E. Salk, Pittsburgh, will undergo extensive clinical trials this year. This vaccine is prepared from killed viruses and the immunity developed to it, in all probability, will be of comparatively short duration. Also, the incidence of reaction to the vaccine must be determined after many thousands of injections, even though early results indicate a rather low reaction rate.

Attempts are being made to attenuate living poliomyelitis viruses and to find a naturally occurring virus that has a low virulence but will give a lasting immunity similar to that obtained from the cowpox viruses to smallpox. This of course will be the ultimate answer to poliomyelitis.

Library's "Laundry Kits" Praised

The solution reached by the Memorial Library of the Texas Medical Association for its shipping container problem has received acclaim in the May-June issue of *Special Libraries,* the official publication of the Special Libraries Association. An illustrated item calls attention to the problem faced in shipping material to doctors throughout Texas and then in getting it returned, and to the "laundry kits" of fiber board which have been found satisfactory two-way containers since their introduction some six months ago. The article suggests that other libraries which have loan services by mail might follow the lead of the Texas Medical Association in the use of such handy containers.

CONTRIBUTIONS TO LIBRARY

The Woman's Auxiliary to the Texas Medical Association recently contributed $1,000 to be set up as an endowment fund for the Memorial Library. The Auxiliary's past presidents have donated $340 for the purchase of back issues of journals for the Library.

MOTION PICTURES FOR LOAN

Transthoracic Esophageal Diverticulectomy

16 mm., color, silent, 24 minutes.

This motion picture shows a transthoracic excision of a diverticulum of the lower third of the esophagus. Such an operation has been made feasible by the development of the antibiotics, by easy availability of blood for multiple transfusions, and by skilled physician-anesthetists. The patient in this instance has a large diverticulum immediately above the diaphragm. A one-stage diverticulectomy with immediate repair of the esophagus is presented.

Back to Normal

16 mm., sound, 16 minutes.

The fact that today the loss of a limb, even two limbs, does not mean that the victim need live a life different from normal is emphasized. A man with two artificial legs dances and plays tennis. A child who lost a leg skips and plays with other children. This is an excellent film for nursing classes and physical therapists.

Regional Anesthesia

16 mm., color, silent, 50 minutes.

This film presents the most important clinical phases of regional anesthesia. Abdominal regional block and various methods of subarachnoid block are shown. The transsacral block anesthesia is given in detail. Under cervical plexus block, reduction of an ulnar fracture is shown. Following ulnar and median nerve block, the replacement of a damaged digital flexor tendon with a graft is demonstrated in detail.

Ascorbic Acid and Scurvy

16 mm., sound, 25 minutes.

Ascorbic acid and its relation to scurvy are shown in this film prepared by Dr. Frederick F. Tisdall. The film depicts the history, physical signs, symptoms, diagnosis, and treatment of scurvy. Clinical photographs and roentgenograms are used to illustrate a few typical cases. This film will be of interest to pediatricians and general practitioners.

BOOK NOTICES

[1]Living with a Disability

HOWARD A. RUSK, M. D., *and* EUGENE J. TAYLOR, *in collaboration with* MURIEL ZIMMERMAN, O.T.R., *and* JULIA JUDSON, M. D., *Institute of Physical Medicine and Rehabilitation. New York University-Bellevue Medical Center. 207 pages. $3.50. Garden City, N. Y., Blakiston Company, 1953.*

The authors of this commendable book have collected much widely scattered information on self-help devices to enable the physically handicapped to live as nearly normal lives as possible. The book is addressed primarily to the person with a disability and to those about him responsible for his welfare but also should be useful to the physician in helping him to solve some of the complex problems of rehabilitation which he encounters in his practice.

The book deals with devices other than orthopedic braces and prosthetic appliances and with special living arrangements which have been found helpful in aiding the disabled person to retain his independence. The authors have depicted a large variety of ingenious methods which have been devised, often by the handicapped person himself, to facilitate the performance of otherwise difficult or impossible tasks.

The photographs and drawings are uniformly good, and the book is accompanied by a detailed inventory of the activities of daily living by which the status and progress of the patient can be accurately assessed.

[1]*Ben Walpole, M. D., Houston.*

[2]The Allergic Patient and His World

FLORENCE EASTTY SAMMIS, M. D., M.S.P.H., F.A.A.A., *Assistant Attending Physician in Allergy, Nassau Hospital, Mineola. A Monograph in the Bannerstone Division of American Lectures in Allergy. Edited by* MAX SAMTER, M. D., *Chief, Allergy Clinic, University of Illinois College of Medicine, Chicago. 156 pages. $4.75. Springfield, Ill., Charles C Thomas, 1953.*

The author has presented in compact form a description of the most common allergic manifestations—hay fever, asthma, and allergic skin disorders. The causative agents are discussed extensively. Allergic diagnostic techniques are described and some of the pitfalls are documented. Discussions of the theoretic bases of allergic phenomena are rightfully kept to a minimum. She has accomplished the initial purpose which she set forth in the introduction, "to inform the allergic patient about his problems and aid him in carrying out the instructions and treatment outlined by the physician."

The author has encountered a difficulty inherent in the presentation of a technical subject. While in some instances she has adroitly side-stepped involved discussions that have no place in a book for patients, in many instances the presentation is clouded by involved discussions that go far enough to cause confusion but not far enough to clear up the questions raised. Examples of erroneous concepts resulting from discussions include the impression of migraine. The value of the basic information useful to the patient is somewhat diminished because of some of the resultant confusion and partial misconception formulated by the author.

[3]The Hypertensive Disorders of Pregnancy

ERNEST W. PAGE, M. D., *Associate Professor, Obstetrics and Gynecology, University of California School of Medicine, San Francisco. 108 pages. $3.75. Springfield, Ill., Charles C Thomas, 1953.*

This is a neat little volume. The adjective applies to the format, binding, and editing as well as to the content. The author's authority cannot be questioned. Neither can his honesty and sincerity. The material is well organized and presented in a simple, lucid, and factual manner. In chapter two, devoted to physiologic and bichemical changes, the author deserves credit for achieving his stated purpose, "to present factual data separated from speculation about etiology." The author's classification of the toxemias of pregnancy is similar to that proposed by the American Committee on Maternal Welfare but places deserved emphasis on "recurrent toxemia." A glaring typographical error is the omission of subhead B under class 11 from the classification proposed by the American Committee on Maternal Welfare. In the discussion of etiology, the author admits a justifiable preference for his own theory. The accuracy and comprehensiveness of the factual material, the straightforward presentation, and the suggestions for logical application of known facts to clinical problems combine to make the book one of real merit. It can be warmly recommended

[2]*Jack M. Rose, M. D., Houston.*
[3]*William F. McLean, M. D., Austin.*

to all practitioners who give serious consideration to the problems encountered in the practice of obstetrics.

[4]**Modern Concepts in Medicine**

JULIUS JENSEN, PH. D. *(In Medicine)*, M.R.C.S. *(England)*, L.R.C.P. *(London)*. *636 pages. $11.50. St. Louis, C. V. Mosby, 1953.*

This book is well written, not ultrascientific, but practical and should be of inestimable value to students and general practitioners.

[5]**Dermatology in General Practice**

JACOB HYAMS SWARTZ, M. D., *Assistant Professor of Dermatology, Harvard Medical School and Post-Graduate School; Consulting Dermatologist, Massachusetts General Hospital. Foreword by* C. GUY LANE, M. D., *Professor Emeritus, Department of Dermatology, Harvard Medical School; Consulting Dermatologist, Massachusetts General Hospital, Boston. 581 pages. $11. Baltimore, Williams and Wilkins Company, 1953.*

This is an average sized book on dermatology which is replete with illustrations and diagnostic charts. From the point of view of diagnosis the book is excellent. I used the book for six months in my practice before making this review, and as a general rule I found it an entirely satisfactory place to take dermatologic problems. The one exception was found in diseases of the hands. I think that the author could have gathered together his information better in one place on this particular item. From the point of view of treatment, the textbook was all that could be expected of a book of this size. However, the average general practitioner will find that he has to take some of his more difficult dermatologic problems to some of the more comprehensive texts or to the medical journals.

[4]*W. E. Tatum, M. D., Beaumont.*
[5]*Woodson W. Harris, M. D., Austin.*

[6]**A Guide to Human Parasitology**

D. B. BLACKLOCK, M. D. (Edin.), D.P.H. (London), D.T.M. (Liver.), *Formerly Professor of Tropical Hygiene, Liverpool School of Tropical Medicine, University of Liverpool, and* T. SOUTHWELL, D. Sc., Ph. D., *Formerly Walter Myers Lecturer in Parasitology, School of Tropical Medicine, University of Liverpool. Revised by* T. H. DAVEY, M. D. (Belf.), D.T.M. (Liver.), *Professor of Tropical Hygiene, Liverpool School of Tropical Medicine, University of Liverpool. Fifth edition. 228 pages. $5.50. Baltimore, Williams and Wilkins Company, 1953.*

This book was written as a guide to the general practitioner, for diagnosis and prevention of diseases in man due to animal parasites. Only material pertinent to this premise has been included in order to avoid confusion from unnecessary voluminous information.

The writer assumes that the reader has had no experience in this field, but with the use of this guide can become proficient in the diagnosis of human parasites.

The text is well illustrated, including only points in the parasite's life cycle at which control measures may be applied.

A chapter on the microscope is included, devoting space to its description and use and to instructions in the use of the ocular and stage micrometer. Then follow chapters on the various parasites, grouped according to their classification. The life cycle, distribution, the method of preparing material for examination, and a short note on prevention is presented in each chapter.

The fifth revision has included parasites encountered in the tropics during World War II.

A final brief chapter is devoted to congenital infection and immunity.

This book should be useful to the general practitioner as a concise reference on parasitology, using only apparatus usually found in every office.

[6]*William J. Swann, M. D., Sterling City.*

ORGANIZATION SECTION

AMERICAN MEDICAL ASSOCIATION

AMA San Francisco Meeting

A program including almost every phase of medical practice with special emphasis on the results of research and advances in diagnosis and treatment will be given at the one hundred third annual meeting of the American Medical Association in San Francisco, June 21-25.

More than 200 scientific exhibits, including special features on fractures, preceptorships, and blood banks, and 400 technical exhibits will be shown at the Civic Auditorium during the meeting.

The Distinguished Service award will be made by the AMA House of Delegates in the opening session Monday morning in the ballroom of the Palace Hotel, and the new President will be installed at the inaugural meeting at the same hotel Tuesday evening. The ceremony, at which Dr. Walter B. Martin, Norfolk, Va., will be installed, will be broadcast over the American Broadcasting Company's radio network for those who cannot attend the meeting. Also at the nation's largest medical meeting the National Broadcasting Company's television network will carry on-the-scene views of the physicians studying medical advances. This program is expected to have 14,000,000 viewers when it goes on television screens at 8 p. m. Central Standard Time, Thursday, June 24. The world premiere showing of some outstanding films of broad general interest will be given at the Wednesday evening meeting of the AMA at the High School of Commerce Auditorium, where all the scientific meetings will be held. Telecasting of clinics and operations will originate in the San Francisco General Hospital and will be shown in the Drill Hall of the Masonic Temple during the session.

Registration for this five-day meeting will be at the entrance to the Portico of the Civic Auditorium, beginning on Sunday for those who are in San Francisco before the meeting gets under way. General officers of the AMA and members of the House of Delegates may register for the Scientific Assembly at the entrance to the ballroom of the Palace Hotel.

Besides a full schedule of scientific meetings and many exhibits to see, there will be an inaugural ball for the President following the ceremony Tuesday evening; fraternity and alumni associations will have reunion luncheons and dinners throughout the week; and the thirty-eighth golfing tournament will be held on Monday. A full schedule for the Woman's Auxiliary, with headquarters at the Fairmont Hotel, is also planned. Special tours to interesting places in California as well as a trip to Hawaii are being planned for postconvention relaxation.

SURVEY OF TEXAS COUNTY MEDICAL SOCIETIES FOR 1953

Results of a survey covering activities for the year 1953 have provided a basis for the establishment of new programs which will be designed to strengthen membership, attendance, and prestige of the 116 county medical societies in the state. The survey was conducted at the request of the President of the Texas Medical Association, Dr. F. J. L. Blasingame, Wharton. Questionnaires were completed and returned by the secretaries of 90 societies.

An analysis of the survey, along with recommendations, presently is being studied by Dr. Blasingame, the Board of Trustees, and the Executive Secretary of the Association. It is anticipated that several positive programs will be initiated shortly. Methods are being explored for establishing a more effective two-way system of communication between county medical societies and officers of the Association, district councilors, and representatives of the central office.

Almost two-thirds of the membership of the Texas Medical Association is affiliated with the 14 largest county medical societies in the state. Actually, 4,328 of 6,678 physicians (64½ per cent) are members of the 14 societies. Seventy-one of the 116 societies have 25 or fewer members, with a combined membership of only 943, which is 14½ per cent.

The survey revealed a definite correlation between the numerical membership of the county medical society and the percentage of attendance at meetings. The smaller societies attained the highest percentage of attendance, average attendance for societies with 10 or fewer members being 71 per cent. Conversely, the larger societies attracted the least number, average attendance for the 4 largest societies being 15 per cent of total membership.

The number of meetings conducted by county medical societies during the year varied little despite differences in the size of membership. A great majority of societies scheduled 10 to 12 meetings. The lone major variation was reported by the small societies, which, for the most part, held only a few business meetings.

In almost every medical organization, it is not unusual to have at least a few members who never attend a meeting and who contribute little or nothing to the welfare of organized medicine except for their routine payment of dues. Results of the survey indicated that the percentage of "deadwood" in a society increases with the numerical size of membership. More than half of the smaller societies (5 to 10 members) reported that they did not have any members who failed to attend at least one meeting in 1953. On the other hand, very large societies in metropolitan areas listed a relatively high percentage of "deadwood." The 4 largest societies averaged 29 per cent who did not attend a single meeting.

According to the reports of the secretaries, councilors met with only 43 per cent of all societies in the state last year. Sixteen per cent of the smaller societies (5 to 10 members) listed a visit from their councilor. However, several secretaries cited the councilor of the district for his loyalty and interest, and it has been pointed out that failure of county societies to follow up feelers from conscientious councilors may have reduced the number of visits by councilors. Seven of the 10 societies with membership ranging from 100 to 215 reported that councilors attended one or more meetings; the 4 largest county societies—Harris, Dallas, Bexar, and Tarrant—all acknowledged visitations.

The survey also documented the need for establishment of a program of visitations to county medical societies by officers of the Association and representatives of the central office.

Analysis by Size of Society

The results of the survey were analyzed according to numerical membership of county medical societies. Separate studies were made of societies with memberships of 5 to 10, 11 to 25, 26 to 50, 51 to 99, 100 to 215, and 216 to 1,100. These findings follow.

Societies with 10 or Fewer Members.—Twenty of the 116 county medical societies of Texas (17 per cent) have 10 or fewer members. There are 3—Coryell, Freestone, and Hamilton—which have only the minimum number of 5. Combined, these 20 societies have 156 members, representing 2½ per cent of the total membership of the Texas Medical Association.

These societies conducted an average of 2 formal meetings during 1953, although the number varied between 1 and 12. Montgomery County Medical Society recorded the high of 12. Generally, societies which held only 1, 2, or 3 meetings a year were more likely to devote those sessions to business than to scientific programs. More than 25 per cent of these societies held combination business meetings and scientific programs. The analysis revealed that the number of formal meetings sponsored by a society during the year did not necessarily portray the effectiveness of that organization. For example, Dr. H. L. Stewart, Navasota, reported: "Most of the Grimes County membership is together throughout the day. With this small group, many medical problems are discussed without the formality of a meeting."

Attendance at meetings of these societies was generally good. These small societies reported 71 per cent average attendance. Several societies, such as Coryell and Shelby-San Augustine-Sabine, indicated that it was not unusual for all members to be present. An average of only 8 per cent of the total membership of these organizations did not attend a single meeting during the year. More than half of the societies reported that they did not have any members who failed to attend at least one meeting.

Secretaries of these societies reported few visitations from district councilors. Only 2 of the 16 societies (16 per cent) returning questionnaires acknowledged a visitation during 1953 by a councilor.

TABLE 1.—*Summary of Survey of County Medical Societies in Texas for 1953.*

Society Membership	No. of Societies*	Combined Membership*	Average Attendance (%)	Average No. of Meetings	"Deadwood"† (%)	Visited by Councilor (%)
5-10	20 (17%)	156 (2½%)	71	2	8	16
11-25	51 (44%)	787 (12%)	68	12	13	40
26-50	22 (19%)	720 (11%)	49	11	9	25
51-99	9 (8%)	687 (10%)	37	10	10	57
100-215	10 (9%)	1,490 (22%)	38	10	17	70
216-1,100	4 (3%)	2,838 (42½%)	15	15	29	100

*Figures in parentheses represent percentage of total covered by Texas Medical Association.
†Members of a society who did not attend a single meeting in 1953.

Several secretaries suggested the establishment of a speakers bureau for the purpose of strengthening programs of the small societies. Several also pointed out that the limited memberships of their organizations prohibits the invitation of prominent guest speakers. Four societies—Caldwell, Gonzales, Guadalupe, and Hays-Blanco—have found a satisfactory solution to this problem by meeting jointly bimonthly, thus providing a larger audience for speakers.

Societies with Memberships of 11 to 25.—Approximately 44 per cent of the medical societies in Texas (51 of 116 societies) have between 11 and 25 members each. These societies have a combined membership of 787, representing 12 per cent of the membership of the Texas Medical Association.

During the past year, these societies conducted an average of 8 meetings each. Four societies sponsored 12 formal meetings. There was 1 society which had only a single meeting. A great majority of the organizations held combination business meetings and scientific programs. Most of these societies also reported 1 or more social functions.

Attendance at meetings was uniformly good, averaging 68 per cent. Only 5 reporting societies with 11 to 25 members reported average attendance at less than 50 per cent for each meeting. Forty-two per cent of the societies indicated that every member attended one or more meetings during the year. For all societies, however, an average of 13 per cent of total membership did not attend a single meeting. Two societies listed 10 members each who were totally inactive.

Secretaries of 60 per cent of the societies in this group reported that the councilor did not visit them last year. Nevertheless, it is evident that several councilors were extremely active. Palo Pinto-Parker acknowledged that its councilor was present three times.

Several societies noted positive trends in regard to attendance and interest by the membership. The need for meetings with the district councilors and with representatives of the central office was cited by several officers.

Societies with Memberships of 26 to 50.—Approximately 19 per cent of the county medical societies (22 of 116 societies) have memberships which vary from 26 to 50 members. These 22 societies have 720 members, representing 11 per cent of the total membership of the state Association.

These societies conducted an average of 11 meetings during 1953. All but one society staged a minimum of 7 meetings. An outstanding record for the year was achieved by the Hunt-Rockwall-Rains-Delta Counties Medical Society. It sponsored 40 meetings, 38 devoted to scientific programs, 1 to business, and 1 a social affair. Seventy-five per cent of all meetings held by these societies were devoted to a combination of business and scientific matters.

The average attendance at meetings was 49 per cent. The most outstanding attendance record in this classification was claimed by Bowie County Medical Society. It achieved an average attendance of 70 per cent (24 members present from a membership of 35). A typical society in this grouping had 32 members, with an average attendance of 16 at meetings. These societies also had an average of 3 members who did not attend any meetings last year. Six societies reported that they had no "deadwood" at all. On the other extreme, 4 organizations indicated that they had 10 or more members who had not attended a single meeting.

Another debit was the comparatively few visitations made to these societies by district councilors. Only 25 per cent of the reporting secretaries listed a visit to the society by the councilor.

Societies with Memberships of 51 to 99.—Eight per cent of the county medical societies (9 of 116 societies) list the membership roster at between 51 and 99. These 9 societies have a combined total of 687 members, which is approximately 10 per cent of the membership of the Texas Medical Association.

Most of these societies met monthly, with the number of meetings ranging from 8 to 12 and averaging 10 per society. In most instances these societies combined a business meeting with a scientific program. An average of 1 social function annually also was listed by these organizations.

Average attendance at meetings was 37 per cent. The highest average attendance was reported by Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson Counties Medical Society. This society claimed 80 per cent average attendance, representing 50 present of the total membership of 63. These societies indicated that an average of 10 per cent of the total memberships were inactive and had not attended any meetings during the year.

Secretaries of 57 per cent of the societies listed their district councilors as having met with them at least once.

Societies with Memberships of 100 to 215.—Nine per cent of the county medical societies (10 of 116 societies) have memberships ranging from 100 to 215. These 10 societies have a total of 1,490 members, representing 22 per cent of the membership of the state Association.

Most of these societies convened monthly. The actual number of meetings varied between 6 and 18, with an average of 10. El Paso County Medical Society staged a high of 18 meetings, including 16 scientific sessions. Scientific programs predominated over business meetings for societies in this classification, although frequently a portion of the meeting was devoted to each.

Average attendance at meetings was 38 per cent. Championship honors among these societies went to the Taylor-Jones Counties Medical Society, which listed 60 per cent average attendance. El Paso County Medical Society reported a definite "upswing" in attendance at recent meetings. Officers of that society singled out the serving of buffet suppers as an important factor which stimulated attendance.

"Deadwood," those who never attend a meeting, averaged 17 per cent for societies with 100 to 215 members. Again Taylor-Jones compiled an enviable record, listing its nonparticipants at 5 per cent. On the other extreme, 1 large county medical society stated that approximately 40 per cent of its total membership did not attend a single meeting.

Secretaries of 7 out of 10 of these large societies said that their councilors met with them at least once during the past twelve months. Some societies lauded their councilors for meeting with them regularly. Nevertheless, more frequent visitations by councilors was urged by several secretaries.

Societies with Memberships of 216 to 1,100.—Harris, Dallas, Bexar, and Tarrant Counties Medical Societies, the 4 largest in Texas, have a combined membership of 2,838, representing 42½ per cent of the total membership of the state Association.

Harris and Dallas met monthly, while Bexar and Tarrant conducted semimonthly meetings. Types of meetings conducted by each follow:

Society	*Scientific*	*Business*	*Social*
Harris	6	4	0
Dallas	8	1	1
Bexar	15	4	2
Tarrant	10	4	5

The percentage of attendance at meetings of these 4 societies, like most others located in metropolitan areas, was comparatively low. Dallas and Tarrant figured average attendance at 20 per cent during 1953. Bexar listed 16 per

cent average attendance. The secretary of Harris County wrote that attendance varied from 1½ to 4 per cent for scientific meetings, 4½ to 6 per cent for regular business meetings, and 30 per cent for the annual meeting.

These 4 county medical societies reported a high percentage of members who did not attend any meetings during the year. Harris estimated that more than half of its membership did not attend a single meeting. Dallas listed approximately 24 per cent of its membership as nonparticipants; Tarrant 13 per cent. Bexar listed no figure.

The secretary of each society reported that the councilor met with the society at least once during the year.

COUNTY SOCIETIES

Armstrong-Donley-Childress-Collingsworth-Hall Counties Society

March 19, 1954

(Reported by Carter Holcomb, Secretary)

Differential Diagnosis of Chest Pain—Horace Wolf, Amarillo.

Armstrong-Donley-Childress-Collingsworth-Hall Counties Medical Society met for a dinner with the auxiliary on March 19 at Memphis. The third annual meeting of county medical society presidents and secretaries held in Austin in January was discussed.

Dr. Wolf illustrated with case histories his presentation on chest pain.

Baylor-Knox-Haskell Counties Society

February 10, 1954

Baylor-Knox-Haskell Counties Medical Society met February 10 in Munday to hear the telephone broadcast originating in Austin, "Recent Advances in Internal Medicine."

Officers elected at the meeting were C. G. Markward, Knox City, president; J. W. Foy, Seymour, vice-president; R. L. Newsom, Munday, secretary-treasurer; and T. S. Edwards, Knox City, and E. H. Balch, Seymour, delegates.

Bosque County Society

February, 1954

Bosque County Medical Society met in February at the home of V. D. Goodall in Clifton and elected the following officers: R. D. Holt, Jr., Meridian, president; A. N. Pike, Iredell, vice-president; N. E. Dudney, Clifton, secretary-treasurer; and Dr. Goodall, delegate.

Brooks-Duval-Jim Wells Counties Society

February 25, 1954

Stephen Williams, Corpus Christi, spoke to the Brooks-Duval-Jim Wells Counties Medical Society February 25 after a dinner with its woman's auxiliary in the home of Dr. and Mrs. W. H. Newkirk, Alice.

Brown-Comanche-Mills-San Saba Counties Society

March 9, 1954

(Reported by Ned Snyder, Secretary)

Brown-Comanche-Mills-San Saba Counties Society at its March 9 meeting in Brownwood voted to endorse a project of its auxiliary to sponsor a student nurse through three years of training. The person chosen, endorsed by the society, will be one who could not afford training and would be given $200 yearly as a loan. If the nurse practices three years in one of the four counties in the society, the loan will be cancelled; if the nurse does not return to one of the four counties to nurse, she will be required to return the money borrowed when she is able, and the money will be used to aid another student in the same way.

Cameron-Willacy Counties Society

March 15, 1954

(Reported by Harry A. Miller, Secretary)

After a dinner and program of entertainment by the woman's auxiliary on March 15 in Brownsville, Cameron-Willacy Counties Medical Society held a business meeting. The society voted to move the Tumor Clinic from Harlingen to Brownsville if the American Cancer Society will continue to give its support, and a short film on cancer was shown to the society and approved for showing to lay groups.

Dr. Clarence N. Cash, San Benito, was elected to honorary membership.

Colorado-Fayette Counties Society

January, 1954

At a dinner meeting in Weimar during January, Colorado-Fayette Counties Medical Society elected E. T. Williams, La Grange, president. Other officers elected were Willis G. Youens, Weimar, vice-president; August J. A. Watzlavick, Schulenburg, secretary-treasurer; and Lyman E. Ihle, Schulenburg, delegate.

Cooke County Society

February 8, 1954

Louis E. Aiden, Dallas, was guest speaker at the Cooke County Medical Society meeting February 8 in Gainesville.

Dallas County Society

February 9, 1954

(Reported by Glenn D. Carlson, Secretary)

Symposium on Coronary Insufficiency—Howard E. Heyer, Dallas, Moderator.
Acute Coronary Insufficiency—Carleton B. Chapman, Dallas.
Myocardial Infarction—Alfred W. Harris, Dallas.
Effect of Drugs on Coronary Circulation—Andres Goth, Dallas.

At the February 9 meeting of the Dallas County Medical Society the above program was given. New doctors elected to membership were Charles Edward Van Cleave, Jr., Hugh D. Murray, E. C. Brown, Guy B. Fain, William L. Berson, Edward L. Rhodes, Joseph C. Ogle, Irvin Joseph Goldfarb, Joseph B. Gordon, II, Joseph Edward Wilke, Jr., James Emmett Goode, Leonard M. Rifkin, Allen T. Stewart, Jr., and Richard B. Hunter. A student nurse scholarship fund for Dallas County which was proposed by the woman's auxiliary was approved by the society with the provision that approval of the person to receive the scholarship be made by a committee of the society. The purpose of the scholarship fund will be to assist financially young men and women who want to study nursing but are unable to do so because of lack of funds.

March 9, 1954

(Reported by Glenn D. Carlson, Secretary)

Clinical and Investigative Value of Cardiac Catheterization—John A. Osborne, Dallas.
Moderator—Alfred W. Harris, Dallas.

Before the above scientific program was presented, members of the Dallas County Medical Society were dinner guests of the Baylor Hospital medical staff on March 9 in Dallas. Medical economics news was reviewed by the executive secretary of the local society, Mr. Millard Heath. The society voted to take no action on the administration of the Salk poliomyelitis vaccine until further information was received. The public health committee was given additional time to explore the facts regarding the vaccine.

March 23, 1954

(Reported by Glenn D. Carlson, Secretary)

The Dallas County Society met in a special called session on March 23 to consider a report of the public health committee and board of directors concerning the poliomyelitis vaccine field trials in Dallas. Both the committee and the board of directors recommended that Dallas County Medical Society approve the voluntary participation of its members in the proposed voluntary mass vaccination of Dallas second grade children.

Harris County Society

April 14, 1954

Harris County Medical Society held a business meeting April 14 in Houston. It was announced that a series of television programs, entitled "Focus on Health," which have been produced by the society and Houston Public Schools would begin the next Sunday afternoon. James Schofield, assistant dean of Baylor University College of Medicine, Houston, is narrator for the series.

Nueces County Society

March 9, 1954

(Reported by Gerald S. Ahern, Secretary)

Threats to Our Freedom—W. Oliver Harrison, pastor, First Christian Church, Corpus Christi.

Nueces County Medical Society met with its woman's auxiliary March 9 in Corpus Christi and heard the above speech. Plans for the Boys City fund raising campaign in Corpus Christi and tentative plans for mass inoculation of the trial poliomyelitis vaccine were discussed.

Tarrant County Society

March 16, 1954

(Reported by S. W. Wilson, Secretary)

Early Diagnosis and Management of Upper Gastrointestinal Hemorrhage—Charles Terrell, Adolph Kauffmann, Robert D. Moreton, and Charles Robinson, Fort Worth.

The program as outlined above was given at the March 16 meeting in Fort Worth of the Tarrant County Medical Society. Plans for the poliomyelitis immunization program were discussed, and the society approved the use of the vaccine in Tarrant County schools.

April 6, 1954

(Reported by S. W. Wilson, Secretary)

Cancer of Head and Neck—Oscar L. Morphis, Fort Worth.

After hearing the above scientific program, the Tarrant County Medical Society, meeting April 6 in Fort Worth, held a discussion led by John B. Patterson. A report of the legislative committee was given by Ernest E. Anthony, Jr., chairman. The results of a study of proposed national legislation concerning social security and a reinsurance program for health insurance plans were presented to the society.

Dr. Bertha S. McDavitt was voted an honorary member of the society.

Tom Green-Eight County Society

April 5, 1954

(Reported by Joe L. Cornelison, Secretary)

Chronic Cervicitis—William F. Mengert, Dallas.

The Tom Green-Eight County Medical Society met April 5 in San Angelo and heard the above scientific program.

A report on the functions of the committees was given, and it was decided that the secretary should mimeograph a copy of the duties of the committees and send a copy to each member. A report was given on high school athletic care costs.

Travis County Society

April 20, 1954

Travis County Medical Society held a business meeting April 20 at the Texas Medical Association headquarters, Austin.

The following committee reports were made: blood bank, S. W. Bohls; cancer, Dr. Bohls; cerebral palsy, W. W. Kelton, Jr.; diabetes, Henry Renfert, Jr.; emergency call panel, Walter D. Roberts; heart, Thomas M. Runge; legislative, Raleigh R. Ross; mediation, Earl L. Yeaker; and mental health, David Wade. Other reports given were poliomyelitis, Frederick C. Lowry; public health, B. O. White; public relations, David O. Johnson; school health, Cary Legett, Jr.; tuberculosis, J. E. Johnson; and woman's auxiliary, James M. Coleman. A discussion of the proposed amendments of the Texas Medical Association's constitution and by-laws was held.

Washington-Burleson Counties Society

January, 1954

Cancer of Pancreas—L. R. Rodgers, Houston.

The above program was given in Brenham during January at a dinner meeting of the Washington-Burleson Counties Medical Society given by the Milroy Memorial Hospital staff.

Wilbarger County Society

March 2, 1954

The Wilbarger County Society held a business meeting March 3 in Vernon to consider a proposed city garbage disposal plan. F. B. Steele, president, presided over the meeting; the members approved the proposal.

DISTRICT SOCIETIES

Tenth District Society

April 10, 1954

(Reported by Rider Stockdale, Secretary)

Prepartum and Postpartum Hemorrhage—Julius McIver, Dallas.
Laminographs and Other Specialized Roentgen-Ray Techniques—John J. Sazama, Jr., Dallas.
Growth and Development of Infants—C. James Krafft, Dallas.

James C. Klein, Lufkin, was named president-elect of the Tenth District Medical Society when it met April 10 in Nacogdoches, and Dan Spivey, Lufkin, was nominated secretary-treasurer-elect. Serving as president of the society this year is John M. White, Port Arthur; Rider Stockdale, Jasper, is secretary-treasurer.

L. C. Heare, Port Arthur, was chosen as a nominee for Trustee of the Texas Medical Association if a geographical representation is adopted. If the geographical plan is not put into effect, Dr. Heare was nominated to succeed himself as Councilor. Stephen B. Tucker, Nacogdoches, presently Vice-Councilor, was named as nominee for the councilorship if Dr. Heare should become a Trustee.

The scientific program was given as outlined above.

Eleventh District Society

April 15, 1954

Bronchoscopy as Aid to Diagnosis in Lung Disease—Cuthbert Young and J. P. Mullowney, Tyler.
Place of Diet in Management of Heart Disease—Edward D. Futch, Galveston.
Psychiatric Emergencies in General Practice—A. Hauser, Houston.
Recent Advances in Gynecology—Felix Rutledge, Houston.

The above scientific program was heard by members of the Eleventh District Medical Society at the April 15 meeting in Crockett. Auxiliary members held a meeting the same day and met for dinner with the society that evening.

AUXILIARY SECTION

AN ALLY

Because the Texas Medical Association was regularly accompanied by the doctors' wives as "visiting ladies" at its annual meeting, the desirability of coordinating their effort became apparent. The purpose in organizing as an Auxiliary, as stated in the constitution, was "To bring into closer fellowship and sympathy the families of Physicians. To engage in any benevolent and philanthropic work they saw fit—also to extend the aims and purposes of the Medical profession through the Doctors' Wives to the various Women's Organizations which look to advancement in health and health education."*

At the suggestion of Mrs. J. O. McReynolds of Dallas, the first meeting of doctors' wives was called in May, 1917, in Dallas; this group became the Dallas County Auxiliary. News of the activities of this unit spread throughout the state, and organization of other auxiliaries followed the same year—McLennan County in June, 1917, and Bexar in October, 1917. The members working in these county groups felt the need for a "mother auxiliary," and the ladies in attendance upon the annual state medical meeting in San Antonio in 1918 were called together informally to consider the advisability of forming a State Auxiliary. Mrs. H. R. Dudgeon of Waco prepared the platform upon which the state organization was formed, and Dr. E. H. Cary of Dallas, President of the Texas Medical Association at the time, championed the cause of an organizational movement among the doctors' wives.

Current members of the Auxiliary, looking at the formation of a State Auxiliary on that May day in San Antonio in 1918 and at its growth up to May, 1954, with a membership of approximately 4,700, can see the influence the doctors' wives have had as they have worked side by side with their husbands. As the Texas Medical Association has grown in scope and number of members, so has its ally the Auxiliary. In 1943 the membership of the Association was 4,607; in 1953 it had increased to 6,723. In this ten years the membership of the Auxiliary increased from 2,176 to 4,463. There were 61 county auxiliaries in 1943, with a 40 per cent increase in 1953.

Paralleling its growth has been the Auxiliary's progress and influence as reflected in its projects, based upon requests from the Medical Association. One of its first and chief activities has been the distribution of health education literature and dissemination of information pertaining to health. Another has been its effort to alert both its members and the public to the hazards of certain types of legislation and the desirability of adopting other measures relating to health. For example, members of the Auxiliary received credit for materially assisting in the enactment of a minimum standards law in Texas.

In connection with health education and the furthering of health projects, Auxiliary members have worked closely with other health agencies active in the state. Hospitals have benefited by the work of doctors' wives, who have donated equipment, given library service to the patients, and sometimes organized hospital auxiliaries to serve as nurses aides, typists, and hostesses. Service also has been contributed routinely to cancer, tuberculosis, heart, poliomyelitis, diabetes, and other specialized agencies in the health field.

During the past ten years the Auxiliary's work in the area of nurse recruitment has been important. Effective results have been obtained by giving loans and scholarships, by organizing and sponsoring future nurses' clubs, by furnishing speakers and showing motion picture films on nursing, and by arranging tours of hospitals. In these more recent years the Auxiliary has done much also in civil defense, mental health, geriatrics, and development of interest in health matters among high school students by sponsorship of essay contests.

A large percentage of the county auxiliaries maintain some type of benevolent funds, and most contribute to the State Auxiliary's special funds to aid needy physicians and their families, to assist medical students financially, and to help develop a medical library with services readily available to all the doctors in the state.

Through the thirty-six years of its existence, the Woman's Auxiliary has proved itself a willing and helpful ally to the Texas Medical Association. With the inspiration of the past goals reached, its officers believe that the program of service will broaden and that the membership will strive continually to maintain the high ideals of the medical profession and to serve the purposes for which the Auxiliary was organized.

Officers of the Woman's Auxiliary to the Texas Medical Association: President, Mrs. Mark H. Latimer, Houston; President-Elect, Mrs. Joseph H. McCracken, Jr., Dallas; First Vice-President, Mrs. Mal Rumph, Fort Worth; Second Vice-President, Mrs. Harold Lindley, Pecos; Third Vice-President, Mrs. Howard R. Dudgeon, Jr., Waco; Fourth Vice-President, Mrs. Troy A. Shafer, Harlingen; Fifth Vice-President, Mrs. August J. Streit, Amarillo; Recording Secretary, Mrs. P. M. Kuykendall, Ranger; Corresponding Secretary, Mrs. William M. Palm, Houston; Treasurer, Mrs. J. C. Terrell, Stephenville; Publicity Secretary, Mrs. A. H. Neighbors, Jr., Austin; Parliamentarian, Mrs. John E. Hill, Marshall.

**Mrs. W. A. Wood: The Early Years of the Woman's Auxiliary to the State Medical Association of Texas, 1918-1932.*

NATIONAL CONVENTION

Mrs. George Turner, El Paso, will be installed as President of the Woman's Auxiliary to the American Medical Association at its thirty-first annual session, San Francisco, June 21-25. Headquarters will be at the Fairmont Hotel, with the formal opening of the convention being Tuesday morning. Other than business meetings, a tea and a luncheon will be given in honor of the President and President-Elect during the session. Members are also invited to attend the reception and ball in honor of the President of the AMA on Tuesday evening, June 22. The general meetings will end Thursday, with only the officers and committee chairmen meeting Friday morning.

COUNTY AUXILIARIES

The *El Paso County Auxiliary* entertained high school nursing club members and their mothers with a tea on March 25. Other honored guests were the high school nurses and leaders of the three nurse-training organizations of El Paso. Brochures on the forty schools of nursing in Texas, New Mexico, Colorado, and Arizona, prepared by Mrs. W. W. Wollmann and Mrs. Louis Breck, were presented to the nurse adviser of each high school. The auxiliary sponsored in March and again in April two-day sales of articles made by the Lighthouse for the Blind. Mrs. Morton H. Leonard was chairman of the sales. A "Make Your Own" style show and a hobby show highlighted the auxiliary's April 12 luncheon meeting.

The *Bell County Auxiliary* heard Dr. S. W. Thorn, Houston, chairman for the Texas Medical Association of

the American Medical Education Foundation, in Temple on March 12. Mr. N. C. Forrester, Austin, executive secretary, Texas Medical Association, was also a guest at the meeting. A business meeting followed Dr. Thorn's speech. At the February meeting of the auxiliary, Charles F. Mitchell, acting director of the State Mental Health Department, spoke on "Preventive Mental Health." Mrs. R. R. White, Temple, was elected president.

At the March 29 luncheon of the *Harris County Auxiliary* members of the Harris County Society were invited to "Laugh with your Lady," which was the theme of the day. Morris Frank, humorist for the Houston *Chronicle,* was speaker. Dr. Elizabeth Powell, recording secretary of the auxiliary, was honored as Doctor of the Day and presented with a bouquet of red carnations. This is the first time that the auxiliary has chosen a Doctor of the Day in connection with Doctor's Day. Mrs. Jasmine Logan Sadler spoke on "Torch Bearers of Tomorrow" at the February meeting.

The *Wichita County Auxiliary* honored the society with a dinner dance, which approximately 240 members and guests attended, in Wichita Falls February 20.

Another auxiliary honoring the society for Doctor's Day during February was the *Dallas County Auxiliary,* which held a dinner dance on February 13.

Public relations was stressed at the March luncheon meeting of the *Taylor-Jones Counties Auxiliary.* Robert Kennedy, public relations representative from the local utilities company, spoke about the doctor's wife in the community.

The *Navarro County Auxiliary* met in the home of Dr. and Mrs. Louis E. Gibson, Corsicana, on April 2 to hear a discussion on "Safety in Driving," given by Bill Simmons and Charles Blankenship from the Department of Public Safety. The auxiliary decided to send *Today's Health* to teachers of pupils who entered the essay contest sponsored by the auxiliary. Mrs. S. H. Burnett, Corsicana, was elected president at the group's March 5 meeting.

Members of the *Webb-Zapata-Jim Hogg Counties Auxiliary* entertained the three Laredo winners of the essay contest they sponsored with a barbecue on March 17 at the home of Dr. and Mrs. E. M. Longoria. Another auxiliary urging students to enter the contest was Gregg County Auxiliary, which offered prizes of $15, $10, and $5 to the three local winners.

Among auxiliaries which have elected new officers are *Falls County Auxiliary,* which met February 16 at the home of Dr. and Mrs. C. R. Miller, Marlin, and named Mrs. Miller president; *Hunt-Rockwall-Raines-Delta Counties Auxiliary,* which chose Mrs. H. E. Mehmert, Greenville, as president in a February 2 meeting at the home of Dr. and Mrs. F. S. Carruthers, Greenville; and *Cooke County Auxiliary,* which has recently installed Mrs. Ben Fisch, Gainesville, as president.

The *Bosque County Auxiliary* met in the home of Dr. and Mrs. V. D. Goodall, Clifton, and elected Mrs. S. L. Witcher, Clifton, president; Mrs. Joseph Stout, Sherman, was chosen president of the *Grayson County Auxiliary* at a recent meeting; and Mrs. Ivan Readinger, Fort Worth, has been installed as president of *Tarrant County Auxiliary.*

Mrs. E. W. Coyle, San Antonio, State Auxiliary President, spoke on "Our Duties as Good Citizens to Our Husbands and Their Profession," to the *Travis County Auxiliary* at a luncheon meeting February 16. A style show was held before Mrs. Coyle's speech. Mrs. S. W. Bohls, Austin, is president of the auxiliary, and Mrs. G. G. Zedler, Austin, is president-elect.

Mrs. Coyle was honored at a tea by the *Hidalgo-Starr* and *Cameron-Willacy Counties Auxiliaries* during February in Mercedes. Also at the tea was Mrs. A. B. Pumphrey, Fort Worth, past State President.

The *Galveston County Auxiliary* held a coffee honoring members of all women's civic organizations, parent-teacher association members, and school faculty members on February 16. A skit entitled "Johnnie's Toothache," which had recently appeared on television, was presented by a group of elementary school children.

Nueces County Auxiliary members were guests of Nueces County Society at a dinner in Corpus Christi on March 9. W. Oliver Harrison, pastor of the local First Christian Church, was guest speaker.

DEATHS

E. R. CHAPMAN

Dr. Eugene Rhea Chapman, Los Angeles, Calif., formerly of San Antonio, died January 21 in Los Angeles of glomerulonephritis.

Born in Bennett, Iowa, July 16, 1905, Dr. Chapman was graduated from the State University of Iowa College of Medicine, Iowa City, in 1932. He served an internship at Mercy Hospital, Davenport, Iowa, and did his residency at Chicago Lying-In Hospital; he did postgraduate pathology work at Harvard Medical School, Boston.

Joining the Medical Corps of the regular army as a first lieutenant in 1934, Dr. Chapman served during World War II. He was promoted to the rank of major in 1946 and retired as a colonel in 1947. He was chief of the obstetric and gynecology staff of Nix Memorial Hospital and Baptist Memorial Hospital and served as chairman of the department of obstetrics and gynecology at Robert B. Green Memorial Hospital in San Antonio from 1950 to 1953. During this time he was associate professor of clinical obstetrics for Baylor University Postgraduate School, San Antonio branch, and professor of clinical obtetrics and gynecology in the University of Texas Postgraduate School of Medicine, San Antonio branch. He was consultant in obstetrics and gynecology at Brooks Army Hospital and Lackland Air Force Base Hospital. He was a diplomate of the American Board of Obstetrics and Gynecology.

A member of the American Medical Association, Dr. Chapman was a member of the Texas Medical Association through Bexar County Society from 1947 until 1953, when he moved to California.

He was married to Miss Dorothy Kirsten, the singer, May 15, 1951 in New Orleans. She survives, as does a daughter by another marriage, Miss Susan Chapman, New York City.

J. H. AGNEW

Dr. James Howard Agnew, Houston, Texas, died on March 19, 1954, at his home after a long illness.

The son of John H. and Jeannette Belle (Jones) Agnew, Dr. Agnew was born on July 31, 1884, in Pittsburgh. He attended the Findley, Ohio, public schools, and he was graduated from the University of Michigan, Ann Arbor. He received his medical degree from the University of Michigan Medical School, Ann Arbor, in 1910, and interned at University Hospital, Ann Arbor. He was an instructor at the University of Michigan Medical School from 1910 to 1914 and was a professor at the Medical College of Alabama, then

in Mobile, from 1914 until 1917. After serving as a major with the Army Medical Corps during World War I, Dr. Agnew moved to Houston. He practiced there from 1919 until 1940, when he retired. Dr. Agnew had been bedridden since 1946.

An honorary member of the Texas Medical Association since 1947, Dr. Agnew had been a member of the Association and of the American Medical Association continuously since 1920 through Harris County Medical Society, and he

DR. JAMES H. AGNEW

was secretary of the section on Medicine and Diseases of Children in 1924. Former president of the Texas Club of Internists, Dr. Agnew was a life member of the American College of Physicians, a diplomate of the American Board of Internal Medicine, and an honorary member of the staffs of St. Joseph's Infirmary, Methodist Hospital, and Memorial Hospital. He was a member of Sigma Xi, honorary science fraternity, and Alpha Omega Alpha, honorary medical fraternity. He was a member of the Presbyterian Church.

Dr. Agnew was married to the former Miss Lillian Arft in Ludington, Mich., in 1914. He is survived by his wife; his mother, Mrs. John H. Agnew, Houston; a daughter, Mrs. Jeannette Agnew Bickel, Dallas; and two grandchildren, Dallas.

T. W. MARTIN

Dr. Thomas William Martin, a Port Arthur, Texas, radiologist, died on January 15, 1954, at his home of a heart ailment from which he had suffered for years.

Born in Aukland, New Zealand, on May 25. 1888, the son of John Green Martin and Lydia Burroughs (Smith) Martin, he was brought to the United States when a child and lived in Lake Charles, La., until about twenty-five years ago when he moved to Port Arthur. Dr. Martin attended the University of the South, Sewanee, Tenn., and Louisiana State University, Baton Rouge, and was graduated from Tulane University of Louisiana School of Medicine, New Orleans, in 1916. He interned in Charity Hospital, New Orleans. He was in the Army two years, being a major during World War I, was a ship surgeon for Holland-American Lines for eight years, and took his residency in Tuoro Infirmary, Lake Charles, before moving to Port Arthur in 1930.

A member of the Texas Medical Association through Jefferson County Medical Society almost continuously since 1930, Dr. Martin was a member of the Southern and American Medical Associations. He was a member of the Episcopal Church. He was a member of the Texas Radiological Society,

DR. T. W. MARTIN

a member of the Radiological Society of North America, and a board member of the American College of Radiology.

Survivors include his wife; two brothers, John Martin, Port Arthur, and Charles Martin, Lake Charles; and two sisters, Mrs. Grace Browne and Miss Sallie Martin, both of Lake Charles.

He was married to the former Miss Maude Phelps Western on May 12, 1934, in Port Arthur.

R. G. McCORKLE

Dr. Robert George McCorkle, San Antonio, Texas, nationally known as a specialist in the diagnosis and treatment of tuberculosis, died of coronary thrombosis in a local hospital on March 20, 1954.

The son of Henry Leonard and Henrietta K. McCorkle, Dr. McCorkle was born on March 16, 1892, in Dallas. He attended a boy's school in Dallas and was graduated from the Baylor University College of Medicine, then in Dallas in 1916. Dr. McCorkle interned at Robert B. Green Memorial Hospital in San Antonio. After military service during World War I, he was a resident physician at the State Tuberculosis Sanatorium, near San Angelo and later did graduate work at Colorado School of Tuberculosis. He had practiced in San Antonio since 1922. He was medical superintendent of Woodmen of the World Memorial Hospital, San Antonio, a consultant at Brooke Army Hospital; and on the staff of the Santa Rosa, Nix Memorial, and Robert B. Green Memorial Hospitals.

Dr. McCorkle had been a member of the Texas Medical Association continuously since 1918 and was also a member of the Southern and American Medical Associations. President of the Texas Tuberculosis Association at the time of his death, Dr. McCorkle helped organize the Bexar County Tuberculosis Association and was first president of it; he was chairman of the Bexar County Tuberculosis Control Board. Dr. McCorkle was past president of the American Academy of Tuberculosis Physicians; a member of the

American Trudeau Society. National Tuberculosis Association, and National Rehabilitation Association; and a fellow of the American College of Chest Physicians. He was a fellow of the American College of Physicians, a diplomate of the American Board of Internal Medicine, and a member of the International Medical Assembly of Southwest Texas.

DR. ROBERT G. MCCORKLE

He was a member of the Masonic Order, including Travis Council Knights Kadosh and Shrine, Elks Club, Woodmen of the World, Presbyterian Church, Junior Chamber of Commerce, and the Alumni Association of Baylor University College of Medicine, having served as vice-president of the latter organization. An ardent fan of football and track, Dr. McCorkle was a member of the San Antonio Quarterback Club. He formerly collected antique automobiles.

The former Miss Carrie Gireau, whom Dr. McCorkle married in 1921 in San Antonio, died in 1940. He and the former Miss Carolyn McLean were married in San Antonio on August 26, 1950. He is survived by his wife; two sons, Dr. Robert G. McCorkle, Los Angeles, and Henry L. McCorkle, a student at George Washington University School of Medicine, Washington, D. C.; a brother, W. J. McCorkle, Boston; four sisters, Miss Nellie Kline and Mrs. Irene Stone, Dallas; Mrs. Pauline Burch, Cincinnati; and Mrs. Annie Laurie Leonard, Charleston, W. Va.; and four grandchildren.

J. H. McCRACKEN, SR.

Dr. Joseph Hill McCracken, Mineral Wells, Texas, former president of the Texas Medical Association, died on March 18, 1954, of cardiorenal disease.

The son of William M. and Elizabeth Jane (Doak) McCracken, Dr. McCracken was born October 1, 1867, in Springtown. He attended College Hill Institute, receiving a teacher's certificate, and taught school before continuing his education. He was graduated in medicine in 1891 from the University of Tennessee, then in Nashville, where he was recently honored at graduation exercises with a certificate of merit as a tribute to his long medical career. He interned at the University of Tennessee Hospital. Locating first for three years in Pilot Point and Springtown, he had practiced in Mineral Wells for fifty-one years prior to his retirement ten years ago.

Dr. McCracken was elected vice-president of the Texas Medical Association for 1911-1912 and succeeded to the presidency after the death of Dr. David R. Fly. He was elected an honorary member of the Association in 1945. He had served as Councilor of the Thirteenth District from 1903 to 1907 and as president of the district medical society; he was president of Palo Pinto County Medical Society in 1938. Dr. McCracken had been a member of the Texas Medical Association since 1896 and for many years was a member of its House of Delegates. He was city and county health officer for a number of years, a member of

DR. J. H. MCCRACKEN, SR.

the Kiwanis Club, past president of the Chamber of Commerce, and a member of the Presbyterian Church.

Dr. McCracken and the former Miss Mary Sue Wilson were married in Mineral Wells on October 15, 1895. She survives, as do two daughters, Mrs. Margaret Shankle, Fort Worth, and Mrs. Mary Sue Elder, Mineral Wells; a son, Dr. Joseph Hill McCracken, Jr., Dallas; and a sister, Mrs. Mollie Taylor, Fort Worth.

R. R. SHEPPERD

Dr. Robin Royal Shepperd, Bisbee, Ariz., formerly of Llano, died February 9 of pneumonia in Bisbee.

The son of Mr. and Mrs. Arthur Shepperd, Dr. Shepperd was born on February 6, 1917, in Thornton. He attended public school in Liberty Hill and attended the University of Texas in Austin. He was graduated from the University of Texas School of Medicine, Galveston, in 1942. Serving an internship at the Santa Rosa Hospital, San Antonio, Dr. Shepperd began practicing in Flatonia. He practiced a short while in Burnet, and then practiced in Llano for six years, moving to Arizona a little more than a year ago.

A member of the American Medical Association, Dr. Shepperd was a member of the Texas Medical Association from 1944 until 1953 through Lavaca County and later Lampasas-Burnet-Llano Counties Medical Society.

Dr. Shepperd was a member of Phi Beta Pi medical fraternity. a member of the school board of Llano, president of the Jaycee Club, Llano, and a member of the Baptist Church.

Dr. Shepperd and the former Miss Margaret Fain were married in 1940 in Crockett. He is survived by his wife; a

daughter, Sylvia Shepperd; and three sons, Samuel Arthur Shepperd, Rex Shepperd, and Roy Austin Shepperd, all of whom have moved back to Crockett. Also surviving are his mother, Mrs. Arthur Shepperd, Burnet; a sister, Mrs. Marks Kauffman, Georgetown; and three brothers, Dr. Joe Shepperd and Dr. Ray Shepperd, Burnet, and Dr. W. I. Shepperd, Marble Falls.

J. B. JENKINS

Dr. John Bill Jenkins, Waxahachie, Texas, died January 30, 1954, in a Temple hospital of myocardial infarction.

The son of Dr. and Mrs. A. D. Jenkins, Dr. Jenkins was born in Anderson County in 1889. He attended the University of Texas and was graduated from Vanderbilt University School of Medicine, Nashville, in 1915. He served an internship at Scott and White Hospital in Temple. Beginning his practice in Mooreville in 1916, he moved to Waxahachie in 1920 and practiced there until the time of his death.

A member of the Texas and American Medical Associations since 1917, Dr. Jenkins served as president of Ellis County Medical Society in 1937. He was a charter member of the Waxahachie Lions Club, a member of the Masonic Lodge, and a member of the First Methodist Church.

On November 2, 1916, Dr. Jenkins married the former Miss Kathleen Bowman, Mooreville, who survives him. Other survivors include two sons, John Bill Jenkins, Jr., Corsicana, and Joe Mack Jenkins, Bellaire; two brothers, Dr. Jesse G. Jenkins, Temple, and Sparks B. Jenkins, Mexia; and two sisters, Miss Mary R. Jenkins and Miss Winnie E. Jenkins, both of Dallas.

C. R. BERRY

Dr. Charles Richard Berry, Houston, Texas, died on March 7, 1954, in a local hospital of a heart ailment.

Born September 10, 1883, in Sardis, Miss., the son of Julius S. and Maggie Berry, Dr. Berry was graduated from Mississippi College, Clinton, in 1905 and received a master's degree from the University of Mississippi, University, in 1910. He received his medical education at Tulane University of Louisiana School of Medicine, New Orleans, having been graduated in 1912. Serving an internship at Charity Hospital, New Orleans, he was superintendent of Gilmore Sanitarium, Amory, Miss., from 1916 to 1920. He was a member of the surgical staff of Tupelo Hospital, Tupelo, Miss., from 1920 to 1929, when he moved to Houston.

A member of the Texas Medical Association through Harris County Medical Society continuously since 1930, he was a member of the Southern and American Medical Associations. He was also a fellow of the American College of Surgeons. Dr. Berry was a member of the Masonic Lodge, being a Shriner. He was a member of the Baptist Church.

Dr. Berry and the former Miss Ethel Elligson were married in Houston in 1935. He is survived by his wife; a daughter, Mrs. James T. Dukes, Jackson, Miss.; a son, Charles R. Berry, Jr., Houston; and a sister, Miss Linda Berry, Blue Mountain, Miss.

L. L. HANDLY

Dr. Lucius Lamar Handly, Houston, Texas, died at a local hospital on April 9, 1954, of a heart attack.

The son of John Sherrod and Cornelia (Kell) Handly, Dr. Handly was born February 14, 1890, at Pine Bluff, Ark. He attended the Houston public schools and was graduated from the Tulane University of Louisiana School of Medicine, New Orleans, in 1913. On the staff of the Mississippi State Hospital, Natchez, for three years after his graduation, he began practicing in Houston a short time before World War I. He served as a first lieutenant with the Army Medical Corps from 1917 to 1919 and returned to Houston, practicing continuously there until his death. He was a former chief of staff at Methodist Hospital.

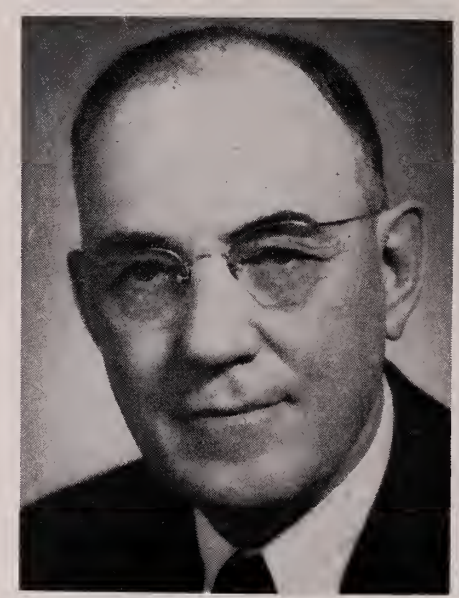
Dr. Handly had been a member of the Texas Medical Association and the American Medical Association through Harris County Medical Society continuously since 1917. He was a member of Alpha Kappa Kappa medical fraternity. Dr. Handly attended the Presbyterian Church and was an avid amateur photographer.

He was married to the former Miss Anna Hafernick in Houston on March 25, 1929. He is survived by his wife; a daughter, Mrs. Helen Handly Felton, Beaumont; a son, John Lucius Handly, Houston; and a brother, Roger Q. Handly, Houston.

J. H. SMITH

Dr. Jerome Hartzly Smith, Jr., San Angelo, Texas, died on March 1, 1954, of acute heart failure.

Dr. Smith was born October 17, 1888, in Aurora, Neb., the son of Mr. and Mrs. Jerome H. Smith, Sr. He attended public school in Lincoln, Neb., and was graduated from the University of Nebraska there. He received his medical education at the Nebraska College of Medicine, Omaha, having been graduated 1928. Dr. Smith practiced two years in Lincoln, was in Lubbock for five years, and moved to San Angelo in 1935. He had been a staff member of the Shannon Memorial Hospital there since 1935.



DR. JEROME H. SMITH

A member of the Texas Medical Association and the American Medical Association continuously since 1931, Dr. Smith was president of the Lubbock-Crosby Counties Medical Society in 1934. He was a member of the Texas Radiological Society American College of Radiology, and the Radiological Society of North America. He served during World War I and was on the examining board during World War II. Dr. Smith was a Scottish Rite Mason and a member of the Rotary Club.

He and the former Miss Leanora F. Stadler were married in Scottsbluff, Neb., on March 29, 1915. He is survived by his wife; one daughter, Mrs. L. R. Gunter, Bryan; and two brothers, Herbert H. Smith, Lincoln, and Dr. Phillip T. Smith, St. Paul, Minn.

President's Page

OUR COUNTY MEDICAL SOCIETIES

Our county medical societies constitute a basic and fundamental part of organized medicine. In my judgment, they are not measuring up adequately to their opportunities and responsibilities.

Group approval, utilizing the prestige drive which is so strong in motivating men, is very influential in American medicine. Acceptance by his colleagues is the most coveted professional asset a physician can have; and disapproval usually is a dreaded curse. A physician is best known and evaluated by his immediate professional colleagues who observe him day by day and who come to learn of his character and skills.

Membership in good standing in the county society is a prerequisite to state and national professional affiliations, as well as the requirement of admission to most specialty societies, boards of certification, and hospital staff appointments. Thus, the significance of county society membership is apparent. Once attained, it is often taken for granted by the average physician, who may treat this membership with a certain amount of indifference.

The minimal obligations of membership are ethical conduct and payment of dues; but, if a physician is to meet these obligations more completely, he must serve. The preservation of the rights of the profession and the advancement of scientific knowledge are efforts that need and deserve the active participation of every member.

A recent survey of our county societies in Texas showed that attendance at meetings is poor. Almost all societies reported several of their members did not attend a single meeting during 1953. A few societies indicated as high as 50 per cent of their membership was not active.

Increasing attendance and stimulating interest of the membership is principally the responsibility of the county society. Effort on a local

level is essential to strengthen the prestige of the county society. Nevertheless, the Texas Medical Association can and should assist the 116 component societies to help themselves.

A plan has been formulated, and approved by the Advisory Committee to the President, to increase visitations to county medical societies by officers of the Association and by representatives of the central office staff. Only 4 per cent of the county societies were visited last year by an officer of the Association other than a councilor. Visitations by the central office staff were reported to be only 8 per cent.

An effort will be made during 1954-1955 to have an officer of the Association or a staff member to meet with each of the 116 county medical societies, or at least all those groups which are willing to extend invitations. This visitation program will be accomplished by a team composed of the President, President-Elect, Vice-President, Legal Counsel, Public Relations Counsel, Executive Secretary, and Assistant Executive Secretary, supplemented by other officers of the Association as well as individual members who are known to possess special knowledge for a particular occasion.

I have written to the president of each county society informing him that we should appreciate an opportunity to meet with his group on any assigned date during the year. The purpose of our visitations will be to gain first-hand information on the problems confronting the society. Our team will report on current activities, programs, and problems which are vital to organized medicine.

Several societies, particularly the smaller ones, have sounded a call for help on their scientific programs. We shall endeavor to provide that assistance.

The Texas Medical Association will make a determined effort in 1954-1955 to aid county societies to strengthen their membership, attendance, programs, and prestige. Our objective is to help each society to become in its community the most potent force in health and medical activities.

J. J. L. Blasingame, M.D.

TPTR diagnotes

REPORT OF COMMITTEE ON PUBLIC RELATIONS: Tabulation of annual session press coverage shows gratifying results (4 advance releases, 82 stories and interviews, 36 pictures, and 12 wire releases). The 98 story, 36 picture total may prove to be the largest coverage of a state association meeting in the nation.

Initial business meeting of the President's Advisory Committee saw 100 per cent attendance. Committee's function will be advisory, but it will serve to coordinate and disseminate information. President Blasingame pointed out and underscored that actions taken by the group were in no sense binding on the Association, but mainly an effort to get all functioning committees and councils to work hand in glove on projects which are of mutual importance.

FROM OVER THE STATE: Some county societies have found a sure-fire way of increasing attendance in dinner meetings, with their auxiliaries serving the meal. In many cases, the allied groups meet jointly for fellowship and a covered dish meal, then adjourn to separate meeting places for business sessions.

When Harris County doctors were honored guests at their Auxiliary's "Doctor's Day Celebration," hostesses found themselves honoring one of their own members, Dr. Elizabeth Powell, lecturer in pathology at Baylor University College of Medicine and a member of both groups. Luncheon lecturer, newspaper columnist Morris Frank, fulfilled program title, "Laugh with Your Lady," with his witticism and pertinent remarks.

Recognizing the effectiveness of good PR at the grass roots level, county medical societies across the state are looking to means of strengthening their local PR committees, and are setting forth new projects for the coming year.

Several years ago, the Smith County Medical Society changed its constitution to provide the society with a president-elect. At that

time, the group changed its PR committee to consist of the president, president-elect, and past president. Society members feel that this arrangement has made their public relations more constant in the expression of society views and thus more workable; also found it enhances their press relations and keeps officers informed of PR events over a three-year period. By rotating officers, at no time is there a new, inexperienced committee guiding society public relations.

Travis County Medical Society is setting up a series of special project subcommittees chaired by members of its committee on public relations. Each major project will have its particular set of workers with members of the parent committee guiding endeavors and acting as coordinator on the over-all program. Subcommittees will direct their efforts toward television, public forums, liaison with local civic groups, and special anniversary medical newspaper section.

ON THE NATIONAL SCENE: A series of four AMA pamphlets designed for distribution to the general public now coming off the press. These readable leaflets get across an important health message with a minimum of copy and will provide excellent material for distribution at fairs, in doctors' reception rooms, and as stuffers in statement and other mailings. Titled "Why Wait," "Health Today," "Quack!" and "On Guard," the leaflets deal with selection of a family doctor, medical progress, medical quackery, and the drug evaluation program of AMA's Council on Pharmacy and Chemisty. Will soon be available in quantity at central office, Austin.

The Hartford County (Conn.) Medical Association is keeping pace with the time by adapting one of its public relations projects to this globe-trotting age. A new exhibit entitled "If You're Traveling to Europe - " listing information on necessary immunization and other medical aspects of traveling abroad was prepared by Hartford physicians for the 1954 travel show sponsored by the Hartford Times. To tie in with the exhibit, a special checklist was developed to help travelers prepare themselves medically for their trips. The checklist gives information about securing medical aid overseas, preparing medical kits, and many other travel tips. Texas societies might adapt this checklist for travelers to Mexico.

TIP OF THE MONTH

For some firsthand information on current public relations problems confronting the medical profession and what to do about them, plan now to attend AMA's Third Public Relations Institute, September 1 and 2 at Chicago's Drake Hotel. This workshop-styled meeting, devoted mainly to an exchange of suggested public relations techniques, is of particular interest to state and county executives and PR personnel of these societies as well as PR chairmen.

TRIBUTE TO THE DOCTOR

The archetype of the country doctor with his kindly smile and black bag, going from house to house in every kind of weather to minister to the minds and spirits as well as to the bodies of his patients, is so familiar as to need no description. However, a word picture of such a doctor as known and loved by his wife, recently widowed, creates anew the faith that the real physician is called to his profession and fulfills his mission only through service to his fellows.

The following excerpts from a letter speak of one doctor, but they might speak of many:

One of the finest things I can say for Dr.———— is that 35 years ago he gave up one of the brightest futures a young doctor could have before him in the city, because he felt that with his wide range of knowledge he could use it to a better advantage in helping humanity in a smaller town. . . .

He installed a very complete office for general examination and treatment. Laboratory, Xray, Diatherm, Sine Wave, Ultra Violet and so on, which really brought modern medicine and treatment of that day to many, many people. He was interested and devoted to both civic and medical progress. His practice years covered two important eras in medicine and civic advancement. He delighted in using the new discoveries in equipment, drugs, and convenient hospitals to save life. But contended before this era the saving of life was more on the doctors initiative and ability . . . .

During the early years of his practice hospitals were more distantly located and inconvenient to reach. It meant all night vigils in farmers and ranchmen homes. Numbers of times swiming swollen rivers on horseback and pulling muddy roads to reach the patients. But he loved every muddy mile and all the people who lived along them and was honored and loved in return.

By grapevine or somehow the folks always knew that the Dr. had to be at a certain place. When the roads were impassable at places, there was always someone there with a team to pull us through. Of all the teams I think a pair of little spanish mules did the best job taking the car through with mud flying all directions. I suppose that I helped in many ways. Chiefly, on OB cases keeping the frightened husbands on their feet by grinding coffee, (I can smell the aroma now) and helping with the midnight feast which was as important as spanking the baby. . . .

I remember one night when the unsuspecting parents were told their croopy, two year old baby boy had little chance with an advanced case of diptheria. A tube was fished out of the little black bag (which was always, to me, like pulling rabbits out of hats). was inserted in trachea to keep the child alive until anti toxin took effect, which was about daylight. Today, the person is manager of one of the big base

ball league teams. Now those things are simple but 30 years ago to be called in and find a child dying with diptheria, knowing what the little medicine bag held, your courage to act and God's Will were your only resources, was entirely different. When you came out of it you felt a little closer to that family and a little closer to God. I remember once my husband saying, "Thats when a doctor wants to quit doctoring and go to preaching."

A TEXAN GOES TO THE TOP

Texans are doffing their ten-gallon hats this month to a lady who is keeping the Lone Star State on the national map. Mrs. George Turner, of El Paso, long a beloved and respected member of the Woman's Auxiliary to the Texas Medical Association and successively holder of most of the offices it affords, is being installed in San Francisco as President of the Woman's Auxiliary to the American Medical Association, the highest honor doctors' wives can attain.

Mrs. Turner, proud of her husband and daughters and ever ready to work toward and share in their achievements, has found time consistently through the years to learn the program and organizational aspects of the medical Auxiliary and, indeed, to help mold them. She comes to her present office with a broad understanding of the medical profession and its problems and of how best the Woman's Auxiliary can assist in their solution.

Her fellow Texans are proud of Mrs. Turner, congratulate the National Auxiliary upon its choice of leadership, and offer her their support and best wishes during the coming year.

APPOINTMENT AT THE POLLS

Many years ago our ancestors fought for the right to life, liberty, and the pursuit of happiness. They also fought for something which we often overlook as an important part of an adult's life—the right to vote. Every doctor—as a businessman, the head of a family, and a citizen—owes it to his community, his state, and his federal government to express his wishes regarding the elected government officials for the coming years. This year the people of Texas will elect Congressmen and a Senator to represent them in Washington. They will elect a Governor, other state officers, 16 State Senators, and 150 members of the House of Representatives. It is the duty and privilege of each doctor to vote for the persons who he feels are best fitted to represent him in the Texas and United States lawmaking bodies.

July 24, the date of the first primary for both the Democratic and Republican parties, should be remembered by each doctor as the day when one of his most important appointments is to go to the polls and vote. Those who plan to be on vacation or out of town on that day may cast absentee ballots from July 4 to July 20. The second primary will be on August 28, with absentee balloting permissible from August 8 to August 24.

The general election will be November 2. Put these dates on your calendar—they are appointments which no doctor can afford to miss.

JUNE AGAIN

The perennial transactions of the annual session of the Texas Medical Association and the official membership roster for the year appear in this issue of the JOURNAL. Both are commended to the membership for perusal and for filing as references during the year.

It should be noted that the mailing addresses appearing with the membership list herein are considerably more recent than those in the directory recently distributed to physicians who were members of the Association in 1953 (the current list being up to date as of early June). In cases of doubt or special significance, the directory listing might be checked advantageously against the information in the JOURNAL.

Because of an effort to reevaluate the special committees of the Association as previously constituted and, if advisable, to revise them, publication of the officer and committee list for the year will be delayed.

ORIGINAL ARTICLES

Medical Problems, Unsolved and New

GEORGE TURNER, M. D., El Paso, Texas

THE solution of medical problems is involved in one way or another with our relationships with nonmedical groups of people. This is what we term external public relations. Our job in this field at the state level is concerned with the continuous presentation of thought inspiring material, thereby focusing the right kind of thinking on objectives that achieve the best medical care. During this time of political uncertainty and individual unrest, it has been said that we are living in the "thin of the thick of things." This makes it a privilege to stand firm but fair and honest in doing our utmost to mold public opinion to the conviction of the best course to follow in providing medical care. This is no time for Chamberlainism, and we cannot afford, because of the responsibility upon us, to become an umbrella brigade with limber wrists and capitulating hearts.

I think there is ample evidence that public opinion is more susceptible at the present to the acceptance of "welfare state" projects than it was a year ago. Whether or not this tendency toward less and less freedom of enterprise will increase is the urgent problem that confronts all doctors today. With this basic assumption as a foundation, let us consider specific problems that need our tireless effort toward solution. It is not my purpose to suggest what may be done about them, for this is the task of all of us working together. It is a task which has consumed years and promises to consume many more.

In this area of public opinion there seem to be three fundamental concepts maintained to a greater or less degree in the mass mind of the public. These concepts take the form of demand and concern the cost of medical care, the availability of medical care to all regardless of their ability to pay, and the atmosphere that must combine efficiency with warmth and friendliness in each individual doctor's office.

These are the motivating drives in the mass mind, and we see them express themselves in precise and specific forms of action, which in our society must take place at the ballot box and in our legislative halls.

VETERANS' MEDICAL CARE

We see the specific problem in Congress today of medical care for veterans with nonservice connected disabilities. Doctors feel that sufficient Veterans Administration hospitals have been constructed and are now in operation to care for all service connected cases and see no reason why American taxpayers should finance the medical care of a veteran whose illness is due to alcoholism or some other condition which has absolutely no connection with our armed service. This opinion is not shared by doctors alone. Mr. Holman Harvey writes in the March, 1954, issue of the *Readers Digest* under the title "Must We Follow the VA Route to Socialized Medicine?" that the American people had better decide soon whether or not they want free government medical care, for it is descending upon them with bewildering speed. If left to themselves, the veterans, through their powerful lobby in Washington, largely unknown to the American public, can be counted on to sweep aside the few remaining safeguards of existing law and bring a state of socialized medicine into being for every man who ever wore or will wear a United States uniform. If such designs are carried out, socialized medicine may in the end be foisted upon a people who do not want it by a lobbying abuse of the natural sympathy of the American public toward war veterans, Mr. Harvey believes.

A comprehensive observation of the amount of medical care furnished by the Veterans Administration as of now and the number of doctors working for the Veterans Administration can be seen in a comparison with the total amount of medical care furnished by the membership of our Texas Medical Association. The number of doctors working for the Veterans Administration and the membership of the Texas Medical Association are approximately the same—6,400.

HEALTH INSURANCE

A second specific concern is seen in potential government subsidy in health insurance. Included in the administration's national health program is a plan for reinsuring prepaid health insurance. As explained by the Department of Health, Education, and Welfare, the program would protect the insurance carrier against bad experiences by paying up to 75 per cent of abnormal losses. Ostensibly, the purpose of such a plan is to encourage carriers to experiment in fringe and more risky health coverages. The project would be started with a federal appropriation of $25,000,000

President's Address delivered at the Opening Exercises, Texas Medical Association, Annual Session, San Antonio, May 3, 1954.

with the objective of making the fund self-sustaining within five years. The Department of Health, Education, and Welfare would administer the project by fixing all reinsurance rates and cancelling contracts for cause. Private insurance companies, voluntary nonprofit associations such as Blue Cross and Blue Shield, and other voluntary groups could participate if approved by the secretary of the department.

It has been pointed out that private companies in the health insurance field already reinsure each other, just as life insurance companies do. With the government entering this field, one of two things would happen. It either would be self-supporting as suggested or else it would lose money. If it is self-supporting from fees, there would be no advantage over the private reinsurance plans now operating. If it loses money—which is more likely—we will have a government subsidy for health insurance ready to be expanded into a full scale, national compulsory health insurance corporation.

The more experience we have with health insurance, the clearer it becomes that the most helpful plan is a voluntary one in which the insured is protected from unexpected and damaging medical care expense but pays minor medical bills himself as a part of his calculated cost of living. A policy containing a $50 deductible clause with all the small print, gimmicks, and concealed deceptions left out would constitute a substantial and helpful safeguard in medical care. It is desirable to tell the buyer exactly what the policy includes and what he can expect for his premium money.

Many of the activities we are doing, we must continue to do and do better, in the area of public services. Our efforts in rural health must be enlarged, and we must acknowledge a growing demand for local health forums. We must not be afraid to provide medical leadership at the community level. There is a strong likelihood of an increasing indigent medical care problem, and we must recognize this need to inform better our own communities of their responsibilities, as well as ours, in this field.

EDUCATION BY TELEVISION

The utilization of television by county medical societies to present a positive picture of American medicine and further health education ranks in importance with the establishing of good press relations. At least one thirty-minute program each week sponsored and directed by each county medical society where television facilities are available is no doubt one of the best means of presenting topics of general medical interest to television audiences, which constitute a large segment of our population. Many types of presentation, including speakers, forums, panels, interviews, and even dramatic programs, may be used. A combination of one or more of these types with an occasional film strip may be worked into the show.

Two county societies in Texas have led the way in the use of television. Last year Harris County Medical Society adopted a definite policy for appearances on television by members of the society. The Houston policy outlines regulations regarding physicians' appearances, scripts, and introductions and points out that "organized medicine should make full use of the television media." The Lubbock-Crosby Counties Medical Society presents a regular weekly one-half hour program devoted largely to a question and answer forum. The only other medical television programs with which I am familiar and on which doctors appear are those given in fund-raising campaigns by special service organizations such as the American Cancer Society and American Heart Association. I mention these latter efforts only to praise them and wish to urge a wide-awake county medical society television program.

NURSE RECRUITMENT

Our Woman's Auxiliary is doing a fine job of helping in our nurse recruitment program, an effort which should be continued with vigor, but I feel that the type of information being given to prospective students of nursing should be expanded to include training for all other medical associates. These specialists include the pharmacists, medical technologists, physical therapists, x-ray technicians, mental health associates, ophthalmic associates, dieticians, occupational therapists, medical artists, dental associates, public health associates, public health educators, health inspectors, hospital administrators, medical social workers, medical secretaries, medical librarians, vital statisticians, and industrial and skin hygienists. A booklet illustrating and describing these fields of medical interest and listing the Texas schools offering these courses could easily be prepared and made available for prospective students. The Michigan State Medical Society has prepared for use in Michigan a completely informative twenty-six page booklet on medical associates.

PHYSICIAN-HOSPITAL ASSOCIATION

The question of physician-hospital association and the practice of medicine by hospitals perhaps can be solved by closer cooperation and the working together of the Texas Medical Association, Texas Hospital Association, and hospital insurance carriers. It has been pointed out that a corporation cannot be licensed to practice medicine, but only an individual who has met all legal requirements for special education and certification by examination can be so licensed. Pub-

lic welfare requires that the physician must be a free agent and that the physician-patient relationship must not be submerged or controlled by those ineligible for a license.

It would appear clear, therefore, that in order to offset hospital encroachment into the practice of medicine a lease arrangement should be made by the hospital with a licensed physician to furnish special services such as radiology, pathology, clinical laboratory services, and others included under our medical practice act as constituting the practice of medicine. The lease should be vested with complete freedom for the physician to exercise his independent judgment in the professional operation of his department. The arrangement should permit the physician in charge of the department to be directly responsible to the patient and make possible the paying of the fee for professional services directly to that physician. Under such an arrangement, the hospital could not hold itself out to the public as a corporation offering professional medical services.

OSTEOPATHY

The question of the relationship between regular medicine and osteopathy has been actively under study during the past year with joint committee meetings of representatives from the American Osteopathic Association and American Medical Association. A proposal to remove the stigma of "cultism" from the practice of osteopathy, to permit close cooperation of doctors of medicine and doctors of osteopathy in the practice of the healing arts, and to permit doctors of medicine to teach in osteopathic schools are three important points of consideration. The ultimate effect of such close association would be a merger of the two groups or the absorbing of osteopathy by regular medicine. Osteopathic schools have improved their teaching and expanded their curriculums, yet the scope of their instruction is in no way comparable to the requirements exacted of students in our regular medical colleges. Any consideration of merger at this time would seem premature from the standpoint of educational attainment and because of the lack of any concrete evidence that the osteopaths themselves desire to have the stigma of "cultism" removed.

The following quotation is from an editorial in the *Journal of the American Osteopathic Association,* September, 1952: ". . . the American Osteopathic Association reaffirms, in the strongest terms possible, its policy of maintaining a separate, complete and distinctive school of medicine. This reaffirmation is founded in the belief that only as a separate and distinct school of the healing arts can the osteopathic profession fulfill its duty to the public." The 1953-1954 Chicago school's catalogue states in part: "Emphasis is placed on the study of diagnosis, amplifying the generally employed methods by the interpretation of symptoms in terms of the osteopathic concept."

PUBLIC HEALTH SERVICES

Our public health services constitute a valuable adjunct in community medical care through an organized effort in the prevention of disease. This is accomplished by the application of sanitary engineering methods, quarantine, vaccination, and case finding. A realistic cooperation should be continued with the officers entrusted with the application of these helpful health measures. Other problems of deep interest and requiring continued effort are the improving of nursing care, strengthening and supporting medical education through our American Medical Education Foundation or in any private manner desired, and emphasizing the public service importance of the individual doctor concerned with our code of medical ethics. Another clearly defined major problem concerns the strengthening of our own interassociation relations. The leaders of medicine in Texas today and tomorrow must find a way to insure increasing interest, attendance, and activity within every county medical society in the state. Our lines of communication from the thoughtfully charted policies of organized medicine to the individual practicing doctor demand more and more attention.

These are some of the questions we must raise with ourselves for solution — questions stemming from currents and eddies of public opinion, the problems imposed in our necessary public services, and the tasks confronting us in strengthening our own pattern of organization.

Suite 6A, 1501 Arizona.

Coconut Water for Intravenous Solutions

Coconut water may prove to be a source of body fluid replacement in remote areas or under emergency military conditions, preliminary studies have shown, according to an article in the February *Archives of Surgery* by Dr. Ben Eiseman, Denver.

Dr. Eiseman stated that 21 persons have received a total of 26 intravenous infusions of coconut water without any serious reactions, and that animal experiments with coconut water have shown no adverse effects. The preliminary studies have been carried out in Bangkok, Thailand, and in St. Louis.

The coconut water is obtained by withdrawing the fluid from the nut through a tube inserted in the eye of the nut. The fluid is then filtered to drain off any particles of coconut meat. Dr. Eiseman stressed that the present study was too limited to make definite conclusions, but that further study is warranted.

MEDICAL LEADERSHIP

F. J. L. BLASINGAME, M.D., Wharton, Texas

ON behalf of the entire membership of the Texas Medical Association, I should like to express appreciation for the accomplishments of the past year to our retiring President, Doctor George Turner, and to the other officers of our Association, and to the staff of our central office. Our thanks and gratitude go to you. Your work has left a challenge to all who succeed you.

Last year in Houston in accepting the office of President-Elect, I remarked that it was my hope to help to implement and extend the effectiveness of our Association to our profession and to the public. I re-state and renew that hope at this time.

In elevating me to the presidency, the Association has bestowed a high honor upon me; and I am humble and grateful for this trust and confidence. I pledge my best efforts; and, with the continued help of the membership, I am confident that our Association can have another good year.

The Texas Medical Association has a great heritage and has served useful purposes for more than a hundred years. I can see no need for recommending radical departures from past policies; but I am convinced that many of the intended functions and services of our Association can and should be improved.

In the public interest, leadership in health matters should come primarily from the medical profession. Only physicians possess the necessary technical information and skills, have the experience and judgment, and, lastly, but not least, hold to the philosophy that assures our society the best results in the application of medical knowledge.

In matters scientific, all is well; and men and women of medicine are for the most part respected and unquestioned leaders. But in matters socio-economic as applies to medicine all is not well; and leadership in health affairs is constantly being challenged. Naturally, in a competitive society such as we have in America, other groups will absorb this leadership if the medical profession is not vigilant and jealous of its responsibilities. The public must be persuaded that it is in its interest to let this leadership remain with the medical profession and not pass to the politician, the commercialist, or some irresponsible vocal segment of society.

In my judgment, the Texas Medical Association, properly implemented, can serve as an organization through which, in the public interest, our professional leadership in medical matters, scientific and socio-economic, can be maintained.

Address of the President-Elect delivered at the General Meeting. Luncheon, Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

ADVISORY COMMITTEE

Inasmuch as the President can establish special committees, I have taken the initiative to form an Advisory Committee to the President. Because I believe in the soundness and wisdom of group effort and because I feel our Association needs further coordination of efforts, I have created this committee. Ready and free discussions by it of policies of our Association and problems confronting it should lend to decision and action.

This committee will be composed of the President-Elect, Vice-President, Speaker of the House of Delegates, chairman of the Board of Trustees, chairman of the Board of Councilors, chairman of the Council on Medical Defense, chairman of the Council on Medical Jurisprudence, chairman of the Council on Scientific Work, chairman of the Council on Medical Economics, chairman of the Council on Medical Education and Hospitals, chairman of the Committee on Public Relations, and President of the Woman's Auxiliary.

Let me repeat in the beginning for the sake of clearness that this Advisory Committee is in no way to usurp the functions of any other officer, council, or committee of the Association but is to serve in an advisory capacity and in an effort to coordinate.

During the coming year, I anticipate that there will be four to eight meetings of this committee, probably in Austin. I have contacted the members of this committee, and they have agreed to give of their time and energy to try to implement the program of our Association. I shall depend heavily on the advice and decisions of this committee; and I am appreciative of the help its members have offered.

SCIENTIFIC EFFORTS

Our Association is and must continue to be primarily a scientific organization. Our annual session programs must be strengthened and made the outstanding scientific experience in the lives of Texas physicians. Our Board of Trustees has expressed a willingness to expend the necessary funds to stage such a program, and our Council on Scientific Work will endeavor to develop a strong and stimulating program built around a large number of outstanding guest speakers and a series of educational scientific exhibits.

In connection with medical education in Texas, we must press hard to help our medical schools and their

faculties to continue to improve the training of physicians. Our Council on Medical Education and Hospitals can be counted on to work diligently on its problems. We must continue our interest in the Texas Chapters of the Student American Medical Association and in the American Medical Education Foundation.

These and many other scientific efforts are the primary and fundamental functions of our Association and merit continued study and attention.

LIAISON EFFORTS

In my opinion, we should improve our liaison efforts.

We need to exchange ideas with members of the allied professions. I have in mind dentists, pharmacists, nurses, technicians, and hospital administrators. These groups need our advice and guidance, and we should be more aware of their points of view.

It is to the advantage of medicine that its problems be widely understood throughout our society and its services appreciated. It is in this realm that good public relations are essential.

At this particular time our Committee on Public Health has an excellent opportunity to coordinate further our efforts with those of the Texas State Department of Health. I am certain that our Committee on Public Health will take advantage of this opportunity.

Our state hospital program is in need of our continued help.

COUNCILS AND COMMITTEES

I should like to make some comments regarding our various councils and committees. Each of these has been established in the past after much thought and debate and designed to meet a need of our profession or perform a function for our Association. It is necessary, if our program is to be effective, that these segments of our organization carry out their responsibilities with dispatch. In making nominations to fill vacancies in councils and committees I have made an attempt to select individuals who can be counted on to take their responsibilities seriously.

As you know, the special committees are appointed annually by the President. I plan to ask the Advisory Committee to the President to consider our present special committee set-up. It may be a few weeks before the final decisions regarding these special committees are reached.

I will consider it one of my responsibilities as your President to stimulate and coordinate the work of the various councils and committees. A letter is planned shortly to each officer inquiring into his continued interest in the assignment and asking further for a statement of the officer regarding his willingness and determination to do the job he has accepted. I plan to be moderately persistent in my efforts to stimulate interest, and I shall not be timid in reminding a member who does not work that there are other members who are willing to do so. Such an effort on my part is to be made solely for the purpose of attempting to get more participation by our members in the affairs of our Association and to implement its program.

AREAS OF CONCERN

Even though our membership is at an all-time high, I feel that genuine interest in the affairs of the Texas Medical Association appears to be wanting in its members in many instances. Quite frankly, all is not well with our parent organization. There is a problem of geography; and it is physically difficult for the various members to meet and develop a sense of unity. Specialty societies, the Academy of General Practice, and hospital staff meetings occupy the physician's limited time and energy. In three large cities of our state have been developed outstanding clinical assemblies which hold excellent programs. Yet, important as all of these organizations and gatherings be, none is so necessary and important in the general public interest and especially to the medical profession as the parent organizations of county, district, and state societies and the American Medical Association. It is essential that physicians see to it that these basic organizations get the priority of attention they deserve and remain strong and alert.

Our component societies need the attention of the Texas Medical Association.

Should our district societies be continued? If so, what can be done to enhance their usefulness?

In regard to county medical societies, I asked the central office some months ago to make up a questionnaire and mail it to each of the 116 county medical societies; 89 of these societies (77 per cent) replied. Inquiry was made as to the number of members in 1953, number of meetings, the average attendance, visits of district councilors, visits by other officers of the Texas Medical Association, and visits by representatives of the central office staff.

A few of the facts from these reports from the county medical societies will be of interest: 102 of our county medical societies contain 35 per cent of our membership while 14 county societies contain 65 per cent of our membership. The attendance percentage-wise is lowest in the larger societies, ranging down to 15 per cent. The county societies wrote that they felt in general that the councilors should take a greater interest. According to the returns on our questionnaire, the councilors met with only 43 per cent of our societies in the state in 1953. I respect the replies of the secretaries. Nevertheless, I cannot help

but wonder how many county medical societies failed to reply to letters from those councilors who were anxious to make visitations. The survey also showed that, unfortunately, only a handful of societies were visited by an officer of the Association, other than a councilor. Because of lack of manpower in proportion to the task at hand, the central office staff visited only 8 per cent of all county medical societies last year.

A report of this survey will be published shortly in the JOURNAL* and is worthy of study. It indicates that much can and should be done by the Texas Medical Association to try to strengthen membership, attendance, prestige, and programs of the county medical societies. In fact, *it is in this direction I plan to direct my primary attention as President.*

I regret to say that too much indifference by our profession exists toward our county medical society membership; and it is timely that each of us reexamines his attitudes and habits toward his county medical society to see if the deserved respect and allegiance exist. The essential feature which makes the county medical society important is the fact that it is the organization which is depended upon to estimate the day-by-day worth of a physician—who, like all men, is best known by his immediate colleagues who can evaluate his character and professional skill. The physician having attained local approval in his county medical society, much else follows easily in American medicine so far as membership is concerned—not only state and national but most specialty societies, fellowships, and boards. In fact, although a physician may have a legal right to practice his profession, if he cannot attain local approval of his confreres, he usually cannot reach his fullest satisfactions in his professional work and has a deficiency that is a serious handicap.

Since the county medical society is so important to every physician, it behooves him to come to realize this fact and to take advantage of it. One of the greatest services our State Association can do is to help county medical societies become more aware of their importance and to encourage them to become more vital in local affairs and supply leadership in medical matters. Such an accomplishment statewide can have great benefit to the public and the medical profession.

I believe that most physicians will admit that the county medical society is the weakest spot in American medicine—though there is much reason to feel that the weakness is less than it was a few years ago. There has been some awakening, but not enough.

Like other physicians, I believe in local effort; and, in medical organization, it means county society effort. We must assist these county societies to help themselves. Much can and must be done in this aspect of our program.

IT IS I

In a recent mailing by the Foundation for Economic Education, Mr. Leonard E. Read quoted the following verse:

"And so I hold it is not treason
To advance a simple reason
For the sorry lack of progress we decry.
It is this: Instead of working
On himself, each man is shirking
And trying to reform some other guy."

Each of us needs further self-examination and rededication.

Finally, it is the individual man that counts—in medicine as in other human endeavor. Our profession has a Hippocratic Oath. "Do I have it?" is the question each must ask. Our profession has its Code of Ethics. "Do I have it?" is the question. It is in this realm of sound basic philosophy that men of medicine can and must offer leadership. In these trying and confused times I covet for our profession qualities that will give such stature and steadfastness to us that we can serve as leaders not only for our chosen profession in matters medical but in the privileges and responsibilities of citizenship as well.

105 Hawes Street.

*EDITOR'S NOTE: *A report of the county society survey appeared in the May, 1954, Journal, pages 312-314.*

CAT SCRATCH DISEASE

One hundred and sixty cases of cat scratch disease, a relatively new disease which may resemble infectious mononucleosis, tuberculosis, tularemia, malignant tumors, and infected cysts were reported in the April 10 *Journal of the American Medical Association* by Dr. Worth B. Daniels and Dr. Frank G. MacMurray, Washington, D. C.

The doctors reported that the majority of patients afflicted with the condition had had some contact with cats and were in the younger age groups. Many of the patients had skin lesions that persisted from two weeks to two years, the doctors stated. Eighty per cent of the patients had symptoms of infection such as chills, headache, generalized aching, weakness, nausea, abdominal pains, and fever. They stated that a definite diagnosis of cat scratch disease was made by means of a specific skin test. Although the symptoms will disappear spontaneously, the doctors believe that use of some of the antibiotics may be beneficial in treatment of the disease.

Traveling Atomic Energy Exhibits

Mobile exhibits on atomic energy are available from the American Museum of Atomic Energy, Post Office Box 117, Oak Ridge, Tenn. The exhibits, carried by truck trailer, are offered for conventions and other gatherings. Additional information may be obtained from the museum.

IN MEMORIAM

THE REV. E. J. GREGORY, San Antonio, Texas

WE PAUSE in the midst of a heavy agenda for the purpose of honoring those who have fallen in the battle since the last meeting of this body. They are more than one hundred in number, and from their hands you have received the torches which they bore and closed the ranks which they have left broken. This occasion also reminds us that we too are traveling the road to eternity "from whose bourn no traveller returns."

Monuments of stone, steel, bronze, or brick bedeck our countrysides and our silent cities of the dead. They honor the memory of those who have fallen, but today we erect a monument not of stone nor of bronze but of pleasant thoughts and memories of our departed friends.

This occasion would remind us of a question as old as man's existence upon the earth. It is not limited by time nor space, by race, language, or position. This question was asked by Job, who was the author of the first book, with respect to time, of our Bible. In one of his meditations he cries out, "If a man die, shall he live again?" (Job 14:14) Man, if it is not correct to say "all men," has come to grips with this question through the centuries, but he has not always come up with the right answer. Nor has he been willing to accept what the religious man has propounded as a reasonable answer.

There are six categories of mankind into one or more of which every rational individual may be classified. If Job's question were propounded to any group, their answers could be roughly classified as follows:

1. The crass materialist would answer with a strong negative on the ground that nothing exists which cannot be known by means of the five senses.

2. The skeptic would answer, "I doubt it on the ground of insufficient evidence."

3. The agnostic would declare, "I do not know because I have never experienced it, nor can I know until my time comes to die; neither can anyone else know for the same reasons."

4. The atheist would say, "There is no God, nor eternity for man. Death ends it all."

5. The infidel would admit the possibility of life after death, but would insist that in no way should it affect man's existence on earth. He would be simply unfaithful to all he has heard, much of which he has accepted as truth in other years.

6. The believer would give the only positive answer to Job's question when he declared with the Apostle Paul, "I know whom I have believed, and am persuaded that he is able to keep that which I have committed unto him against that day." (II Timothy 1:12)

Nor do we find alone in holy writ these noble expressions of faith, hope, and love. Poets, artists, musicians, have all left indelible impressions upon succeeding generations to the effect that "it is not all of life to live nor all of death to die." Shakespeare has Hamlet to say in one of his soliloquies:

> And makes us rather bear those ills we have
> Than fly to others that we know not of.

Could we who are left behind know the state of those noble physicians who have passed on, we could sing with the poet:

> Life is real! Life is earnest!
> And the grave is not its goal;
> Dust thou art, to dust returnest,
> Was not spoken of the soul.

In the meantime you must carry on until many more of the dread and deadly diseases known in this generation shall yield themselves to your skill. We, the people who are your patients, look to you for guidance in our health program and to bring us through the shadows when we are sick. They who have died left many tasks unfinished and many victories to be won.

> Friend after friend departs:
> Who hath not lost a friend?
> There is no union here of hearts,
> That finds not here an end:
> Were this frail world our only rest,
> Living or dying, none were blest.
>
> Beyond the flight of Time,
> Beyond this vale of death,
> There surely is some blessed clime,
> Where life is not a breath,
> Nor life's affection transient fire,
> Whose sparks fly upward to expire.
>
> There *is* a world above,
> Where parting is unknown;
> A whole eternity of love,
> Form'd for the good alone;
> And faith beholds the dying here
> Translated to that happier sphere.
>
> Thus star by star declines,
> Till all are pass'd away,
> As morning high and higher shines
> To pure and perfect day;
> Nor sink those stars in empty night—
> They hide themselves in heaven's own light.

Let's Get Together

ROGER FLEMING,* Washington, D. C.

THE fundamental issue we face as Americans is the issue of freedom! This is true in the fields of both international and domestic policy. It is equally applicable to doctors and farmers.

Now, of course, you and I will never have a clear-cut choice, either in the political party of our choice or in a general election, as to whether or not we are *for* freedom. It is never put quite that way. The choice is, *are you prepared to take the next step that limits or jeopardizes freedom?* Furthermore, each such step away from freedom is always "dressed up" so that it appears at first blush as though it was designed to promote freedom. Any experienced socialist knows that this is by far the most effective way to get intelligent people to embrace socialism.

Therefore, if we want to analyze the issue of freedom and the real choices available to you and me as citizens, we need to recognize that the job of being a good citizen is a difficult one. The responsibility of freedom-loving citizens to understand the consequences of the choices they make is one that we cannot take lightly.

Farmers know that if we are to have prosperity under peacetime conditions, we must adopt policies which will promote efficiency and high production per man in agriculture and the rest of the economy.

We must seek to maintain full employment and a good distribution of spendable income, which means income after taxes are paid.

We must follow monetary and fiscal policies which will contribute to the maintenance of a more stable general price level.

We must correct government policies which tend to place agriculture at a disadvantage with the rest of the economy.

We must guard against the exercise of monopolistic power by any group, whether it be agriculture, labor, or industry, and prohibit practices which restrain trade.

We must follow policies which will encourage rather than strangle foreign trade.

PRICE SUPPORTS

Price supports have a place in a well-rounded program for the maintenance of farm prosperity, but they cannot do the job alone. While price supports have affected the prices of individual commodities in every recent year, we should not forget that it really was war and the fear of war that kept farm prices above parity most of the time between 1941 and 1951.

There is a lot of misunderstanding based largely on a surplus of misinformation concerning farm price policy issues. If the average citizen is confused, it is little wonder.

For example, the Agriculture Act of 1948 provided authority for the Secretary of Agriculture to use direct payments in conjunction with flexible price supports. All three general farm organizations, both political parties, and the Secretary of Agriculture approved the principal provisions of this legislation.

In a letter dated June 25, 1948, to James Webb, Director of the Bureau of the Budget, the then Secretary of Agriculture Charles Brannan forthrightly approved its flexible price support provisions but objected to the continuation for the year 1949 of rigid price support provisions for certain commodities. He said:

> There are several provisions which we consider objectionable. We object to the provision which gives special treatment to certain commodities such as those which virtually assure a mandatory price support of 90 per cent of parity for tobacco and wool for at least several years. We object, even though the provisions apply only to 1949, to the mandatory 90 per cent of parity or comparable price for hogs, chickens, eggs, and milk and its products.

During the 1948 election campaign President Truman and Candidate Dewey both campaigned for flexible price supports. Neither said a single word against this concept. Yet, a few days after the election federal appointees of some of the government agricultural agencies started the phony chant that the election was a mandate for high, fixed price supports.

In his budget message to the Eighty-First Congress in January, 1949, President Truman, restated the fundamental principles upon which the Agricultural Act of 1948 was based, by saying:

> As I said a year ago, price support should be regarded "chiefly as devices to safeguard farmers against forced selling under unfavorable conditions and economic depression." Their purpose is to bring an element of stability into agriculture. At the same time they should not place excessive burdens on the Treasury and taxpayers or inhibit shifts in production needed to meet peacetime demands and to promote adequate conservation of our soil resources.

BRANNAN PLAN

The next chapter involves the Brannan Plan. It was proposed on April 7, 1949. What was it? What is it? Congressman Albert Gore (Democrat of Tennessee), now a member of the United States Senate, discussed this during the debate on the floor of the

Address, delivered before the General Meeting Luncheon, Texas Medical Association, Annual Session, San Antonio, May 5, 1954.

**Secretary-Treasurer, American Farm Bureau Federation.*

House on July 21, 1949, the day the Brannan Plan was defeated by a vote of 239 to 170.

Speaking for his substitute proposal for the Brannan Plan, Congressman Gore made a vigorous attack on the Brannan Plan and declared that he had not heard of this plan during the 1948 campaign. "The campaign was over before I heard about it," he said. "And think of it! Somebody forgot to put it in the Democratic platform."

Reminding his colleagues that he had not heard of the Brannan Plan until April of 1949, Congressman Gore declared:

> . . . Then almost suddenly we are asked to abandon the parity price approach to a fair exchange value of farm commodities in the marketplace that has gained such wide acceptance, asked to endorse a cluster of delusionary promises of food both cheap and expensive at the same time, asked to approve a policy that would make the farmer dependent upon appropriations from the Treasury for a large part of his pay for what he produces. All of this in so short a time and with such inadequate consideration. . . .
>
> By what mandate are we called upon to endorse this fundamental departure from basic Americanism? . . . All I know is that it is Secretary Brannan's plan. The farmers claim no part of it. In fact, they do not think it is or ever will be a farm plan.

I have heard it is a plan for perishables. Who said so? The commodities to receive 100 per cent supports in H. R. 5345, the legislative version of the Brannan Plan presumably best designed to get Congressional support, were corn, cotton, wheat, tobacco, milk, hogs, butterfat, shorn wool, rice, and peanuts. At least seven out of ten are *storable* commodities.

But, someone says, payments were to be used only for perishables. Again, who said so? The only farm group supporting the plan favored the immediate substitution of direct payments for crop loans on wheat, and in response to a question put to Secretary Brannan in Des Moines, Iowa, in February, 1950, he said he would like to utilize the payment technique on cotton "immediately."

Whereupon someone inquires, if Brannan had authority in the act of 1948 to use direct payments, why all the fuss? Because the Brannan Plan was a "political dipsy doddle"—not a farm program. It presumed to promise high prices to farmers, cheap food to consumers at little cost to anybody. When the Congress found out what he and his left-wing political buddies were up to, the Congress took away the existing authority to use direct payments in conjunction with flexible, "floor type" price supports.

And did this Congressional action, in the Agriculture Act of 1949, to eliminate direct payment authority, together with the authority to draw on Commodity Credit Corporation funds and Section 32 funds to finance their use, bring an anguished wail from Secretary Brannan and those who profess such a great interest in this technique? No, indeed! In fact, President Truman signed the bill without uttering a single peep of protest concerning the loss of this authority.

Could it be that President Truman and Secretary Brannan both knew, as the American Farm Bureau has known from the start, that the proposed level of supports—and not production payments as such—was and is the key to this political panacea? Without exception, every statement we have made to the Congress on this subject has pointed out that the level of supports coupled with the Marxian concept of "equal shares" constitutes the principal distinguishing feature of the Brannan Plan. One of the main results of the Brannan Plan proposal was to eliminate the authority to use the production payment device to implement government price policy.

The fact that the facts just enumerated are so little understood—even by people who are supposed to know—provides another example to illustrate my main point, which is, it is not easy to be an understanding citizen in 1954.

But, you say, that issue is dead. It is dead just like socialized medicine is dead. Of the five congressmen chosen to speak at a party rally in Washington today, four voted for the Brannan Plan in 1949 and the other, a freshman member, recently introduced a Brannan Plan bill in the Congress.

TECHNIQUES

The favorite technique of those who favor maximum political intervention in the economic field is to try to put those of us who support the American system of private competitive enterprise on the defensive—to try to get the public to believe ours is a negative program. And, let us never forget that those who would drastically change the American system have not exhausted their supply of techniques for accomplishing their objectives.

Let us take, for example, the Farm Bureau's campaign during the Korean war period to get affirmative action on the root causes of inflation. This program included emphasis on increased production, reduced federal expenditures, pay-as-we-go taxes, strict consumer credit controls, and wise management of the public debt. To be *for* this program meant being *against* direct price and wage controls which were and are designed to submerge and conceal inflation, and thereby *divert* attention from the need for fundamental remedies that get at its basic causes—the imbalance in the supply of money in relation to the goods available for purchase.

Far too many people have been led to believe that because we opposed direct price and wage controls we were less interested than they in controlling inflation. Ours was an affirmative program—not a

negative program—yet, as I have said, you and I know that efforts were made to twist our position.

A lot of the misinformation on this issue emanated from the "controllers" in government. The biggest lobby in Washington—bar none—was and to some extent still is the federal lobby.

Federal payrollers too often have a vested political interest in maintaining and expanding, if possible, "Big government."

It is important to be against what you are not for. There is nothing unholy about this. Seven of the Ten Commandments commence "thou shalt not . . ." yet, I have not heard anybody suggest that the Ten Commandments constitute a negative program. As I have said, some of those trying hardest to create the impression that our program to protect freedom is negative are interested in the centralization of power and expansion of the activities of the federal government. These are the United States counterparts of the Fabian Socialists.

I was interested in reading the pamphlet, "One Way Only," which is a socialist analysis of the present world crisis and which contains a foreword by Aneurin Bevan written soon after he resigned from the Atlee government, presumably because he was dissatisfied that they were not completely socializing things fast enough. In this document reference is made to the "program" of the party contained in the document entitled "Let Us Win Through Together." In it are listed only two programs that relate specifically to agriculture. They are "the full use of statutory powers against inefficient farmers" and "nationalization of food-producing land which is not fully used." I ask you, what is affirmative about this program?

It seems to me that in the present setting we are about in the position of the orchardist who knows that he will not have much of an apple crop if he does not spray to control the codling moth. It is not so much that he is *against* the codling moth. It is that he is *for* apples. It seems to me that in the discussion of the public issues of the day there are quite a few political codling moths flying around and trying awfully hard to be worms. I wouldn't be surprised if some of them made it!

In addition to indicating the kind of public policy apples we are *for* and the techniques of culture which will improve our possibilities for getting a good crop, any constructive program should continue to contain a prescription for taking care of the codling moths that jeopardize the crop.

I suppose the British thought that Paul Revere was a little negative. He was doing something different than what they were for. All he did was ride through Lexington and Concord yelling, "The British are coming." Yet, today we view him as a great patriot. Why? Because we know he was *for* freedom.

If all of us recognize that today freedom is the issue, that we are *for* those things that protect and expand freedom, and that we are *against* those things which threaten freedom, it may not be too late!

On the other hand, if we are not prepared to "do battle" with the forces that threaten freedom from within, as well as without, then "we're over the hill."

The decision is up to people like you and me throughout America. Let us stand up and be counted for freedom. The choice is ours!

261 Constitution Avenue, N. W.

NEW DRUG COMBATS SHOCK

A relatively new, synthetic drug, l-arterenol, has been found to be of value in combating shock, it was reported in the January issue of *Archives of Surgery* by Dr. R. E. Fremont, Dr. N. M. Luger, Dr. S. N. Surks, and Dr. A. Kleinman.

These Brooklyn doctors report that use of the drug in conjunction with whole blood, blood plasma, and fluids helps to raise blood pressure and makes it possible for some patients in profound shock to undergo extensive surgical procedures.

The conclusions of the doctors were based on a study of 22 patients who were treated with l-arterenol. Intravenous injections of the drug resulted in an immediate, striking improvement in the majority of cases, the doctors stated. The only adverse reaction noted was a sloughing of skin. They added that l-arterenol must not be expected to abolish advanced hemorrhagic shock if the course of bleeding cannot be detected and eradicated. It is essential, they stated, that the cause of the shock state be known and definitive therapy undertaken as quickly as feasible; lost blood must be replaced and continued bleeding stopped.

Medical School Applications

The number of applicants for admission to medical schools has decreased for the fourth consecutive year although approved medical schools are now accepting their largest freshman classes, states John M. Stalnaker in the April issue of *The Journal of Medical Education.* It is pointed out that there continues to be more individuals seeking admission to medical school than can be accepted and that many of the applicants are not qualified for admission.

Mr. Stalnaker states that 23 per cent of this year's applicants had sought admission the year before and were repeating, but the number repeating application to medical school the year before was 31 per cent. Forty per cent of the applicants applying a second time were accepted, and 57 per cent of the new applicants were accepted.

Childbirth

A woman's chances of surviving childbirth today are eight times better than were her mother's, according to the American Medical Association. A woman today has better than 999 chances out of 1,000 of coming through childbirth safely.

TUBERCULOSIS IN REVIEW

I. The Changing Diagnostic Scene

J. EDWARD JOHNSON, M. D., Austin, Texas

ROENTGENOGRAMS of the chest from community surveys and periodic examinations of relatively healthy people are giving indications of pulmonary disease in such early stages that identification is often difficult. Frequently there are no symptoms and the film is not absolutely diagnostic of any one specific disease but merely suggests a half dozen or more possibilities in the differential. Although it is often possible to establish the etiology by serial films over a period of time, when tuberculosis or lung malignancy cannot be ruled out, this delay is dangerous and must not be permitted, but consultation with the pathologist, bronchoscopist, and surgeon should be sought.

The need for increased vigilance on the part of the profession for earlier and more accurate diagnosis of chest lesions is being emphasized by the reports that there are still arriving at the sanatoriums patients who do not have tuberculosis, and by the warnings from chest surgeons that pulmonary malignancy is being identified too late.

Even though many preclinical lung lesions are admittedly as difficult to diagnose positively as is the pre-eruptive stage of measles, visual dexterity and skill is growing apace with many roentgenologists so that they are able to reduce time and expense of identification by expertly narrowing the differential list to two or three conditions.

Germs exposed to effective chemotherapeutic combinations frequently lose their ability to grow in cultures or in laboratory animals.[1] These acid-fast organisms found in sputum, or in tissues removed at operation, cannot be positively identified by the usual standard laboratory methods. Trouble in diagnosis is apt to arise especially in two situations:

1. Cases treated with these drugs before bacteriologic confirmation of the diagnosis has been obtained.

2. Urgent situations in which the differential includes tuberculosis, lung abscess, and pulmonary malignancy. (In this latter instance the only recourse may be in surgical exploration and tissue biopsy.)

A third problem may well arise in the case of the child treated for a primary infection as a prophylaxis against tuberculous meningitis who later develops a lung condition that simulates tuberculosis. This may become grievous if the practice—as is now being advocated[2]—should be adopted generally and due care is not always exercised to guard against errors in diagnosis at the outset (for example, diagnosing primary infection from roentgenograms alone).

It is known that the property of germ resistance is transmitted to succeeding bacterial generations and that the new contact infections also will resist the drugs that originally provoked resistance in the germ ancestry. If the same, or similar, facts are found to be true in regard to these growth alterations, then we shall be shortly in dire need of a new laboratory method of confirmation to replace those methods we seem to be losing.

DIFFERENTIAL POINTS

Metastatic malignancy is occasionally mistaken for tuberculosis. Lung is an early target for wandering malignant cells, especially from breast, thyroid, kidney, and pigmented moles. The latter three may occur even in young subjects and—what is more important—sometimes even before any enlargement is noted in the organ of origin.

Pulmonary calcifications once considered pathognomonic of tuberculosis are now known to arise from several causes.[3] Histoplasmosis has been identified as a rather frequent cause in certain geographic areas.

Inhalants such as silica, cane pumice, and cotton lint usually cause trouble in the lungs only after long exposure and the accumulation of heavy deposits; but beryllium, because of its highly toxic reaction on lung tissue, may establish irreversible changes after short exposure and only small deposits of the element.

So-called coin lesions of lung parenchyma may be due to small localized abscess, tuberculosis, or malignancy.[4] They are potentially dangerous and should be diagnosed as early as possible. If tuberculous, they may remain quiescent for a considerable time only to undergo liquefaction and cavity formation with rapid spread of the disease.

The "hilus thickening" so often reported in chest roentgen-ray examinations may be due to lymphatic enlargement, mediastinal disease or tumor, metastatic deposits, or Hodgkin's disease, or may simply represent engorgement of pulmonary vessels due to heart disease.

Unilateral wheeze is suggestive of several serious conditions and should be investigated thoroughly.

Adapted from a panel discussion presented for the Travis County Medical Society, Austin, January 19, 1954.

When it is inspiratory in type, it may mean bronchial edema from virus pneumonitis.

It should be remembered that *abscess of the lung* may arise from bronchial obstruction by foreign body or malignancy, and also that cancer and tuberculosis may coexist and that any suspicion of the fact calls for prompt exploration.

II. Diseases with Roentgen-Ray Shadows Simulating Tuberculosis

BEN DuBILIER, M. D., Austin, Texas

IN ADDITION to the early preclinical pulmonary lesion that is notoriously hard to diagnose positively by roentgen-ray alone, a number of diseases in various stages of advancement may produce shadows extremely difficult to differentiate from those of tuberculosis. Every doctor reading roentgenograms should be familiar with these conditions and should acquire experience in identifying them, or serious blunders may result.

With no pretense at completeness, the following list is presented as a fair sample of the simulators of tuberculosis that may present themselves for diagnosis in any modern community survey.

A. Primary complex (childhood type infection).
   1. Atypical pneumonia.
   2. Sarcoid, Hodgkin's disease, metastases.
   3. Pneumococcal pneumonia.

B. Adult tuberculosis (reinfection type).
   1. Pneumonitis—atypical pneumonia (virus, rickettsial, and other types).
   2. Nontuberculous pneumonia (upper lobe).
   3. Lung malignancy (especially upper lobe).
   4. Löffler's syndrome (eosinophilic pneumonia).
   5. Meigs' syndrome (women only).
   6. Diseases that may cause abscess, with or without cavitation.
      a. Neoplasm, especially bronchiogenic cancer.
      b. Friedländer's pneumonia.
      c. Bronchiectasis of upper lobe.
      d. Cystic disease (congenital or acquired).
   7. Mycotic infection (fungous disease).
      a. Histoplasmosis (pulmonary calcifications).
      b. Monilia, aspergillosis, and so forth.
      c. Coccidioidomycosis.
   8. Tularemia (nodular, confluent, or lobar).
   9. Inhalant reactions.
      a. Berylliosis (beryllium from neon lights).
      b. Bagassosis (sugar cane fiber).
      c. Byssinosis (cotton lint).
      d. Silicosis (hard rock dust).
   10. Pulmonary edema and congestion from shock, cardiac causes, embolism, and so forth.
   11. Miscellaneous.
      a. Diffuse interstitial fibrosis.
      b. Chronic advanced bronchial disease.
      c. Pancreatic disease.
      d. Sarcoid, Hodgkin's disease, metastases.

C. Miliary tuberculosis.
   1. Miliary carcinomatosis (especially from thyroid).
   2. Mycotic infection (especially histoplasmosis).
   3. Wheatena—probably mycotic (generalized, bilateral, miliary, cottony nodules originally thought to come from wheat field inhalations, now considered to be calcifications from histoplasmosis).

Capital National Bank Building.

MOTOR VEHICLE DEATH RATE

The increase in the death rate from automobile accidents in the United States since 1949 is due to accidents involving drivers and passengers rather than to those in which pedestrians were fatally injured, according to a report by Metropolitan Life Insurance Company statisticians.

Death from motor vehicle accidents in the United States claimed 32,000 in 1949 and approximately 38,000 in 1952 and in 1953.

The death rate of the company's policyholders increased by more than 40 per cent from 1949 to 1952 from accidents in which motor vehicles overturned on the road, ran off the roadway, or hit a curb, pole, or other fixed object. The death rate from accidents involving a collision of two or more motor vehicles was up 26 per cent. On the other hand, the loss of life among pedestrians injured in automobile accidents was only slightly higher in 1952 than in 1949.

More than 90 per cent of the deaths occur among drivers and passengers between the ages of 15 and 29 years. The rise in the death rate in this age group between 1949 and 1952 averaged about 40 per cent, which the statisticians see as reflecting "a growing tendency of many young people to play fast and loose with their own lives and those of their companions."

III. Bronchoscopy in Tuberculosis and Recognition and Management of Tuberculous Laryngitis

O. W. SUEHS, M. D., Austin, Texas

THE indications for bronchoscopy in a known or suspected tuberculous patient can be discussed most conveniently under three headings in that the procedure is (1) a method of obtaining an etiologic diagnosis, (2) a method of observing directly the progress of the disease in tuberculous tracheobronchitis, and (3) a method of therapy.

As an aid to diagnosis, bronchoscopy is used most often to obtain secretions from a segment of the lung suspected of being tuberculous. O'Keefe[2] has reminded that it is useful in determining the cause of bronchial obstruction in a suspected or known tuberculous patient. Only through bronchoscopy can one determine whether the obstruction and pneumonitis is due to erosion of a tuberculous lymph node into a bronchus, a tuberculoma in a bronchus, or cicatricial stenosis following healing of an ulcerated bronchus. Bronchoscopy is used to ascertain the source of hemoptysis and also to differentiate the presence of other bronchopulmonary lesions coexisting with tuberculosis, such as bronchiectasis and neoplasm.

As a method of observing the progress of the disease during the management and treatment of a tuberculous patient, bronchoscopy is indicated to ascertain the condition of the bronchial mucosa prior to collapse therapy and in anticipation of surgery for tuberculous lesions. It also is used to evaluate the response to therapy of previously diagnosed bronchial tuberculous lesions.

As a method of treatment, bronchoscopy is used to apply silver nitrate, streptomycin, and other drugs topically to ulcerogranulomatous lesions of the tracheobronchial tree, as an adjunct to parenteral and aerosol therapy. Tuberculomas and eroded lymph nodes have been removed endobronchially by various bronchologists.

TUBERCULOUS LARYNGITIS

Tuberculous laryngitis is said to occur in from 2 to 4 per cent of all cases of tuberculosis and of course is seen most frequently in the moderately advanced tuberculous patients. It is always secondary to pulmonary tuberculosis. The appearance by mirror laryngoscopy may vary from a simple erythema of a vocal cord to edema and ulcerogranulomatous changes. Edema, ulcerations, and granulations occur most frequently in the posterior portion of the larynx. Hoarseness is the most common symptom and pain is the rule when ulceration is present.

Until recent years treatment of tuberculous laryngitis consisted in vocal rest, applications of chaulmoogra oil, and cauterization with silver nitrate and the electrocautery. These methods were almost always disappointing and have been replaced by parenteral and aerosol administration of streptomycin and dihydrostreptomycin. Most observers believe that the concomitant parenteral-aerosol method of administration is the most effective for both laryngeal and endobronchial lesions.

The prognosis for cure of tuberculous laryngitis after adequate treatment with streptomycin or dihydrostreptomycin is now good. It is apparently better than the prognosis for cure of the pulmonary lesion, which is usually moderately advanced in these cases. A review of several articles on this subject indicates that one can expect complete healing of the laryngeal lesion in about 50 per cent of patients treated and marked improvement in another 25 per cent, even though the sputum remains positive in most cases and in spite of the fact that there is little change in the pulmonary lesion. Pain is quickly relieved with healing of the ulcerations, and there is little or no disability insofar as the larynx is concerned.

There is some danger of disability from the toxic effects of streptomycin and dihydrostreptomycin on the eighth cranial nerve in the labyrinth.

Streptomycin is said to have a predilection for vestibular toxicity,[1] with dysfunction appearing in approximately 15 to 20 per cent of cases soon after treatment is started, but this is reversible on stopping the drug.

Dihydrostreptomycin has a predilection for auditory toxicity in about the same percentage of cases.[1] The auditory dysfunction (hearing loss) becomes apparent only after three or four months of therapy but is progressive for several months even after the drug is discontinued.

IV. Obstetric and Gynecologic Aspects

W. B. HAHN, M. D., Austin, Texas

ALTHOUGH childbearing still imposes an undesirable physical strain on the woman with active pulmonary tuberculosis, the disease no longer constitutes an indication for therapeutic abortion. Under modern drug therapy, management of pregnancy and delivery at term are successfully accomplished in many cases without harm to either mother or baby.

To avoid the dangers arising from undetected minimal or subclinical lesions, the prenatal schedule should require careful screening in the early months of pregnancy. This can be accomplished best by intradermal tuberculin tests and 14 by 17 inch roentgenograms of the chest for all positive reactors.

Pregnancy in a tuberculous woman can be safely advised only when definite assurance of inactivity is established; but careful supervision all through the prenatal and postnatal periods must be maintained. On the appearance of any positive indications of the reactivation of her lesions, the patient must go immediately under the indicated treatment and remain so until after delivery and until competent consultation advises release from the schedule.

I do not advise the extuberculous mother to nurse her baby. The objection is not to the strain of lactation, as was formerly taught, but to the inherent danger in the close association of the baby with a possible source of infection.

Tuberculosis of the genital tract before drug therapy frequently resulted in sterility and occasionally required mutilating excisions. Although it is now better controlled by present-day schedules, the diagnosis in early stages is still so difficult to make with certainty that surgery often must be utilized and sterility cannot always be avoided.

V. Tuberculosis in Children

W. W. KELTON, JR., M. D., Austin, Texas

FOR survey purposes and routine application during infancy and childhood the Vollmer patch test for tuberculosis is accurate and practical. If certain standards are followed, it can give important information. In reading the test, one must observe both redness and induration to call it positive, and, in fact, some pediatricians require vesiculation; all other reactions should be called questionably positive and followed with the application of old tuberculin intradermally. In situations in which sharp differential is required, the use of old tuberculin in 1:10,000, 1:1,000, and 1:100 dilutions is preferable to depending on the patch test.

A positive patch or intradermal test has only one meaning—that the person has been sensitized to tuberculin. The sensitization may have occurred previously or may be the result of present activity. In either case an evaluation of the situation is warranted with any other diagnostic measures that seem practical. Certainly, chest roentgenograms should be made to find either active or healed primary lesions, and if activity is suspected, sputum or stomach contents should be examined for the tubercle bacillus.

The family should be told that this positive reaction to a routine patch test does not necessarily indicate active infection at present and should not be cause for great alarm; that a thorough study of the child is indicated to detect active disease; that all members of the family, particularly grandparents and servants, should be investigated; and that it is important to avoid further contact with tuberculosis.

TREATMENT

Active Primary Complex.—Activity of the primary complex is difficult to assess. Asymptomatic cases can safely be watched carefully with no specific therapy. Symptomatic cases in many instances should only be watched, but the early signs of hilar pressure, spread to a miliary type, or meningeal signs require the institution of chemotherapy not essentially different from adult treatment.

Tuberculous Meningitis.—Several good reports have appeared recently in regard to tuberculous meningitis, the most comprehensive of which is a controlled study in seven pediatric centers from 1948 to 1952 by the United States Public Health Service.[1]

It now seems that a formerly fatal disease has a better than 60 per cent survival rate, although the prognosis in Negroes and very young children is not good, and miliary tuberculosis complicating the men-

ingitis decreases the survival rate tremendously. Many vegetative states are sequels, and most patients have vestibular damage, but hearing returns: no deafness has persisted in streptomycin-treated miliary tuberculosis not complicated by meningitis.

The important drug in tuberculous meningitis is streptomycin, which must be used both intramuscularly (50 mg. per kilogram of body weight daily) and intrathecally (50 mg. every second day) over a prolonged period. The present method is to use repeated six week courses of streptomycin by both routes with ten day rest periods between.

Para-aminosalicylic acid, 2.5 Gm. three times a day by mouth, is necessary continuously throughout the total treatment; in addition to aiding in prevention of streptomycin resistant bacilli, para-aminosalicylic acid seems to stimulate appetite and hemoglobin formation. Isoniazid has proved very helpful in conjunction with the aforementioned therapy and is given continuously for months in doses of 4 to 8 mg. per kilogram of body weight.

Many cases need neurosurgical assistance, and streptokinase or streptodornase intrathecally has helped. Some moribund cases have been given purified protein derivative of tuberculin intrathecally with equivocal results.

VI. Renal Tuberculosis

B. CLARY BATES, M. D., Austin, Texas

THE diagnosis of renal tuberculosis can be made only by the specific identification of the acid-fast organism in the urine either by smear of the sediment, culture, or guinea pig inoculation. Specific symptoms suggestive of urinary tract infection are helpful but not diagnostic.

The treatment of renal tuberculosis is both medical and surgical. The latest drugs and dosages in the treatment of tuberculosis are also applicable to treatment of renal tuberculosis. Too much emphasis cannot be placed on the importance of early diagnosis. If more renal tuberculosis was diagnosed early, there would be much less surgical treatment involved.

Surgical treatment of renal tuberculosis is limited to the general indications for surgery in treating inflammatory disease of the urinary tract. Nephrectomy is reserved for those kidneys which show destructive changes beyond the limit of recovery, and the indication for nephrectomy should be the same indication as for any infectious process in the kidney from any organism. The degree of destruction, the presence of stones, and the degree of obstruction to drainage as a result of infection should be considered as factors in indication for surgical removal of the kidney. Unilateral involvement is also an important factor to consider. The urologist must consider renal tuberculosis in the primary stage as being bilateral. Time is the greatest factor in determining whether bilateral lesions will progress to the fulminating stage or heal as the result of medical treatment. Bladder ulceration not responding to medical treatment with unilateral renal involvement is an indication for nephrectomy.

Prognosis in the treatment of renal tuberculosis is increasingly good as it is with all forms of tuberculosis. One important fact that cannot be overlooked is that complete bed rest is as important in the treatment of renal tuberculosis as it is in the pulmonary type. Complete urologic examination of patients showing positive tuberculin reactions and early pulmonary tuberculosis should be carried out to diagnose renal lesions earlier. More vigilant diagnostic inquiry into obscure urologic ailments by the general physician on patients having history of tuberculosis will bring many of these infections under treatment in the curable stage. The danger of drug resistance, which can now generally be deferred by the proper combination of drugs, should be emphasized.

403 West Eighteenth.

Almost 68,000 light trucks owned and operated by laundries and linen services have been offered to civil defense for emergency ambulance service. Some of these trucks already have been adapted to ambulance use through the addition of emergency fittings to hold stretchers and have undergone trial runs in test exercises throughout the country.

Physicians are rated last, advertising agency executives first, in the list of spenders for entertainment for business purposes, according to a study of the 100,000 members of the Diners' Club, a credit card system covering hotels, night clubs, and florists, the Medical Society of the State of Pennsylvania reports.

VII. Tuberculosis of the Skin

EUGENE P. SCHOCH, JR., M. D., Austin, Texas

THERE is no simple formula for the diagnosis of tuberculous infections of the skin. The disease is as protean as syphilis. The cutaneous response to the tubercle bacillus depends on the existing state of allergy or immunity of the patient.

Clinically several specific types of tuberculoderms are recognized. An indolent, indurated, chancriform ulcer on the exposed skin, with a satellite lymphadenopathy, usually in a child, suggests a *primary inoculation tuberculous complex.* A verrucous, granulomatous, sometimes crusted or purulent lesion on the exposed skin surface suggests the possibility of *tuberculosis verrucosa cutis.* Dull reddish, indurated nodules with central ulceration overlying lymph nodes or bones (usually in the neck) may indicate *tuberculosis cutis colliquativa* (scrofuloderma). Painful ulcers at the mucocutaneous junction of the mouth, nose, anus, or genitals may be the *orificial type* of skin tuberculosis seen in debilitated, advanced tuberculous patients. Coalescent "apple jelly" nodules forming scarring plaques usually on the face of young adults suggest *lupus vulgaris.* A sudden onset of a postexanthematous, papulo-ulcerative eruption in children could represent an acute disseminated *miliary cutaneous tuberculosis.* Generalized, scattered lichenoid papules, crops of grouped ulcerated papules; symmetrically grouped tiny lupus-like papules, or chronic, deep, indurated nodular and ulcerated lesions on the calves could be one of the several types of *tuberculids.*

The danger of spread of skin tuberculosis to other organs is slight. Most patients with cutaneous tuberculosis already have internal tuberculosis. There is a possibility that both localized and hematogenous forms could disseminate secondarily; however, this is very remote. The type most likely to spread to other tissues is the primary complex (inoculation into virgin soil, one who has never had tuberculosis).

All forms of cutaneous tuberculosis except most tuberculids may contain viable tubercle bacilli in the lesions and are therefore potentially infectious to other persons. Probably the primary complex and the extensive ulcerative (orificial and miliary) varieties would be the most dangerous.

The prognosis of skin tuberculosis is variable with the type. The local inoculation types tend to heal spontaneously. Lupus vulgaris runs a chronic, protracted course and is often locally destructive. The orificial and miliary varieties usually eventuate in death. The tuberculids are evanescent but usually clear with improvement of the systemic tuberculosis.

Treatment of cutaneous tuberculosis has paralleled that of internal tuberculosis. *Calciferol* (vitamin D_2) has been popular during the past ten years, especially in the treatment of lupus vulgaris (dosage usually 150,000 units daily). *Streptomycin* and *dihydrostreptomycin* are recommended for those forms in which the bacilli are demonstrably numerous and may be given concomitantly or alternatingly with *para-aminosalicylic acid.* Recently *isoniazid* has been used by many groups successfully and is thought probably to be the drug of choice. The dose of this medication has been from 200 to 600 mg. per day. General tuberculosis regimens of rest, high caloric diets, vitamins, and so forth should be stressed also. Local destruction or removal of small lesions, for example, tuberculosis verrucosa cutis, sometimes also is indicated.

It must be remembered that cutaneous tuberculosis is the expression of only one of the organ systems to infection by the tubercle bacillus. The future hope for its eradication, of course, lies with control of tuberculosis as a whole.

SUCCESSFUL USE OF PLASTIC DRESSING

Successful use of a new plastic dressing for burns and surgical wounds is described in the January issue of *Archives of Surgery* by Dr. Daniel S. J. Choy, Dayton, Ohio. The dressing is a sprayable, transparent, film-forming polyvinyl plastic called Aeroplast.

Dr. Choy based his conclusions on a study of 50 patients treated with Aeroplast who had either first degree burns, third degree burns, skin graft donor sites which were regarded as second degree burn equivalents, or other types of surgical lesions such as operative wounds and lacerations.

The chief disadvantage of the Aeroplast is the thirty to forty-five second period of sharp stinging felt when the dressing is applied to a raw area. Dr. Choy states that some of the advantages are marked savings of time over conventional pressure dressings in application, the feasibility of its use by relatively untrained personnel, applicability to parts of the body poorly adapted to pressure dressings, and transparency, allowing frequent inspection of the burned area without removal of the dressing.

Other advantages are impermeability to bacteria, the absence of tourniquet effect on limbs and of restriction of respiration when applied to the abdomen and thorax, and moderate prevention of bacterial growth.

Aeroplast's advantages in surgical wound cases, Dr. Choy believes, are ability to maintain the sterility of a clean wound, ease of application and removal, no retardation of wound healing, and transparency.

VIII. Recent Trends n Therapy

ROBERT B. MORRISON, M. D., Austin, Texas

FOR years the only effective treatment known for tuberculosis was bed rest. Climate was emphasized. In the recent past the best form of medical treatment added to bed rest such things as pneumothorax, either unilateral or bilateral, phrenic nerve interruption, and the creation of an extrapleural pneumothorax. Usually the surgeon created the latter and it was maintained by the medical man. In some instances the pneumothorax was not effective because adhesions were present and interfered with the collapse. When possible these adhesions were divided and an unsatisfactory pneumothorax was converted into a satisfactory one. On occasion a foreign substance such as oil was placed either in the pneumothorax or the extrapleural space. Pneumoperitoneum was tried and abandoned.

All of the aforementioned procedures are given credit for having accomplished a lot of good in the fight against tuberculosis. They were not, however, without their complications. Only too often such complications as empyema, persistent hydrothorax, the nonexpandable or trapped lung, and bronchopleural fistula made the phthisiotherapist wish for some safer and better means of treatment, but such methods were not at hand. The medical man more or less went in circles trying to apply already established principles in different ways. The surgeon was held in check by the threat of certain infection and faced the abyss of suffocation any time he attempted anything other than an extrapleural procedure. His main weapon was the conventional thoracoplasty. All too often patients referred to the surgeon for thoracoplasty were referred with the hope that a measure of health for the patient could be salvaged, other forms of treatment having failed.

The main argument between the medical man and the surgeon was, so to speak, pneumothorax versus thoracoplasty.

Within the past few years our concepts in the treatment of tuberculosis have changed considerably. Great strides have been made. The discovery of antimicrobial agents effective against the tubercle bacillus in vivo and the development of newer methods of anesthesia have made it possible to do things that the phthisiotherapist could only dream of a few years ago. The previously mentioned methods of treatment have not been abandoned completely but have come to fall into more well defined places. Pneumothorax has been mostly abandoned but is still considered by many to be an excellent form of treatment. Extrapleural procedures again have become popular with the use of prostheses such as lucite balls and plastic plombage to maintain the collapse once it is established. More frequent use of the bronchoscope has helped not only to explain why collapse measures in some instances failed in the past, but also to assist in the avoidance of pitfalls by indicating type of treatment. It is now known that endobronchial disease with stenosis or ulceration of the affected bronchus may produce near catastrophe if pneumothorax is attempted over this lung, and thoracoplasty may fail to bring about the desired end result. For this reason in such cases, where possible, excisional surgery is the procedure of choice. This may call for the removal of an entire lung or part of a lung.

In present times the medical chest physician and the thoracic surgeon are more inclined to work as a team in closer cooperation than in times past. Often a patient with tuberculosis is earmarked for probable ultimate surgery at the very outset of treatment, and the ultimate surgery is looked upon as the consummation of a definite achievement, rather than as a last resort measure. Pleasantly enough, the patient scheduled for ultimate surgery sometimes clears his disease sufficiently to preclude the necessity of an operation.

The revival of pneumoperitoneum has aided considerably in strengthening our present armamentarium against tuberculosis. This procedure, which is now currently popular, is used in conjunction with the antimicrobial agents.

Many patients today are placed on a routine of drugs plus pneumoperitoneum. Pneumoperitoneum has the advantages of being reversible, being relatively safe, having few complications, and attacking bilateral as well as unilateral lesions. Frequently the disease will regress and the patient make a nice recovery on this routine, which includes, of course, careful bed rest and adequate nutrition. Lesions that originally were extensive or that destroyed considerable amounts of lung tissue are observed under this regimen, and when maximum clearing has been obtained, the lesions are then resected. Cooperation with the surgeon in this respect is important, in that the timing of the operation—if it becomes necessary at all—is important. One must not be dogmatic and insist on trying to cure all types of tuberculosis with a medical routine, but *must be able to recognize the point at which medical treatment alone is of no further avail and surgery becomes necessary.* Also, the chances for successful surgery are enhanced if surgery

is performed before drug resistance is developed by the patient's tubercle bacilli.

Within the past few years much work has been done with the various antimicrobial drugs. Various combinations and dosages have been tried in an effort to do two things, (1) find dosages least apt to harm the patient yet be effective against the tubercle bacilli and (2) administer the drugs in such a way as to insure their effectiveness over the longest possible period of time. Streptomycin, dihydrostreptomycin, para-aminosalicylic acid, and isonicotinic acid constitute the backbone of drug therapy at this time. Other drugs are available but are considerably more toxic than those named. All of these drugs can be used singly but are more effective and can be used on a long-term basis when used in combination. Para-aminosalicylic acid is given orally, 10 to 12 Gm. daily. Along with this, streptomycin, 1 Gm. twice a week in the muscle, is administered. This combination is usually effective for eighteen to twenty months. The usual dose of isonicotinic acid at present is accepted as 100 mg. three times a day orally and is usually used along with streptomycin given twice a week. This combination also can be given for long periods. It has been proved that when streptomycin or one of the other drugs is used alone, the patient is apt to develop drug resistance in short order. However, the use of drugs in combination as mentioned earlier greatly delays the time of emergence of drug resistance within the tubercle bacilli.

Other combinations are under trial at present, but the dosages and combinations mentioned are those now recommended. As a rule, these dosages are well tolerated by most patients and no special precautions are necessary. However, drug sensitivity occasionally is encountered. For this reason, if one anticipates the use of these drugs, he should become thoroughly familiar with their toxic manifestations. The current literature is ample in this respect.

The treatment of tuberculosis has not yet been reduced to a simple formula of pills and hypodermic injections. Far from it! Since before Christ, mankind has sought a quick, easy and specific cure for the great white plague. As of this moment we are perhaps a little closer to success than in previous years. However, not yet has anything been found to take the place of the bed in the treatment of tuberculosis. Surely, wonderful strides have been made, but these strides merely make the bed more effective.

The specific cure remains a challenge to the medical profession.

IX. Recent Advances in Surgery

RALEIGH R. ROSS, M. D., Austin, Texas

ARNOLD DE VILLANOVA in 1312 stated, "In most cases of scrofula, external applications are better than the use of the knife." In 1946, Sweet, while discussing the reasons for failure in resection for pulmonary tuberculosis, made the statement that "tuberculosis is not primarily a surgical disease." In discussing the surgical management of tuberculosis in 1949, Shaw observed that "surgery in the treatment of pulmonary tuberculosis occupies a unique position in the field of surgery, in that surgery is not definitive but is merely an adjunct in the treatment of patients having this condition."

We can see how rapidly the concept of the treatment of tuberculosis has changed—the statements just quoted were made and believed for hundreds of years. In the last four years, however, in the early era of improved surgical techniques, antimicrobial therapy, modern anesthesia, and blood banks, our ideas of the treatment of tuberculosis have changed. Now tuberculosis patients are considered for some type of collapse therapy or surgery with the exception of those in whom the disease is so minimal that such treatment is not necessary or of those in whom the disease is so far advanced that therapy of this type is impossible.

TYPES OF PROCEDURES

The types of surgical procedures used in the treatment of tuberculosis are many and varied. They range from simple needle punctures to total pneumonectomy and pleurectomy. Actually, the surgery of tuberculosis has advanced very rapidly in the last five years.

Pneumothorax, or controlled air introduced into the pleural cavity for collapse, is the simplest surgical procedure. This type of treatment is being used less and less. It has been estimated that artificial pneumothorax can be used on only 20 per cent of tuberculosis patients, but the antimicrobial drugs have cut down the number of cases within this percentage.

Pneumonolysis, or freeing of pleural adhesions, is a corollary operation to pneumothorax and so is not

used as much as it was. Pneumonolysis may be either open or closed—carried out with the thoracoscope or with an open chest at thoracotomy.

Extrapleural pneumonolysis or pneumothorax is a procedure that has a few enthusiastic advocates in this country and many on the European continent. It has fallen into disrepute with many because it is technically fairly difficult and requires close postoperative attention and care. It is believed by some that extrapleural pneumothorax brings about the most complete and the most selective collapse possible, and it is well tolerated, even in poor risk patients with a low respiratory reserve.

Lucite balls were used enthusiastically to maintain the extrapleural collapse for several years. Their use has been largely discontinued because of frequent complications following their employment. Plastic sponge has some advocates in this field, but air has remained the most foolproof medium for maintenance of collapse.

Diaphragmatic paralysis, by phrenic nerve crush, is still used occasionally. The addition of this therapy may be enough to allow a lesion to heal which would not heal without this aid. Indications for diaphragmatic paralysis are (1) minimal lesions—to augment bed rest, (2) cavities less than 3 cm. in diameter when pneumothorax has failed, (3) reexpanding pneumothorax needing supplementary treatment, (4) basal lesions beneath an upper thoracoplasty, (5) flare-up around old fibrotic lesions, and (6) resection, after which rest is needed.

Pneumoperitoneum is strongly advocated by some. It has a place in conjunction with diaphragmatic paralysis, bilateral disease, or lower lobe cavities; following lower lobe resections; or when no other procedures are immediately feasible.

Cavity drainage by the method of Monaldi or simple cavernostomy has a definite but limited place in surgery of tuberculosis. Monaldi catheter suction of large balloon cavities with fluid levels may reduce cough and toxicity and improve the general condition of the patient so as to allow definitive surgical treatment later. Rib resection with cavity drainage is a useful procedure in a few patients who have had unsuccessful thoracoplasties or in whom thoracoplasty or resection is contraindicated because of poor respiratory reserve or the position of the cavity.

Pulmonary resection in the treatment of tuberculosis has certain clearly defined and acceptable indications. These are (1) bronchial stenosis, (2) bronchiectasis, (3) lower lobe cavities, (4) thoracoplasty failure, (5) tuberculomas, (6) epithelialized cavities, (7) severe hemoptysis uncontrolled by other measures, (8) destroyed lobes or lungs, (9) tension cavities, and (10) empyema over destroyed lungs.

The type of resectional surgery used may be pneumonectomy, lobectomy, segmental resection, and subsegmental or wedge resection. The mortality rate for this type of surgery is about 3 to 5 per cent.

Resectional surgery has been used successfully in patients of all ages—even in children as young as 2 years of age. By the time a tuberculous process in the lung of a child reaches a stage requiring surgery, it is academic whether it be primary or postprimary. The principles underlying treatment of a disease which has progressed to irreparable destruction of lung tissue are basically the same.

Lung resection has been elected as a preferable procedure with increasing frequency. Concomitant partial thoracoplasty with resection in selected cases has given satisfactory results.

Segmental resection is being used more frequently and now represents one of the most commonly used surgical procedures in the treatment of pulmonary tuberculosis. Excellent results are secured with segmental resection when it is used as the primary procedure in cases with lesions well limited to the segment or segments being resected.

Wedge resection or enucleation of peripheral tuberculomas is being accepted generally. It has been proved that long-standing calcified tuberculomas often harbor live acid-fast bacilli—and so, unless otherwise contraindicated, these lesions should be excised.

Extrapleural pneumonectomy and pleurectomy for advanced tuberculous empyema has been a real step forward. This chronic condition which invalided patients for so long can now be brought under complete control. Of course, patients must have a good contralateral pulmonary reserve.

Decortication for chronic induced pneumothorax with captive lung has brought the rehabilitation of many thousands of patients who would otherwise remain pulmonary cripples. This is a satisfying procedure.

Extraperiosteal and extrapleural plombage still have some advocates, but they also have many critics. The perfect nonreactive substance to fill thoracic dead space has not yet been found.

The classical, staged thoracoplasty is still the yardstick by which resection is measured. There is no question that the clinical results of thoracoplasty are good—this has been proved by many with long-term followups. On the other hand, pulmonary resection has been shown to be a relatively safe procedure. Its use as an alternative to thoracoplasty is rapidly becoming manifest.

The availability of streptomycin, para-aminosalicylic acid, and isoniazid to "cover" the preoperative and postoperative periods has made the rapid progress in the surgical treatment of pulmonary tuberculosis possible.

It is felt by many that the ultimate treatment of pulmonary tuberculosis will be long-term intermittent antimicrobial therapy or resectional surgery.

X. BCG Vaccine

J. M. COLEMAN, M. D., Austin, Texas

THE story of BCG vaccine is that of two worlds apart. In this country, the use of this material is viewed with doubt; in Europe and most other parts of the world it has been administered to millions of persons. The fact remains that the tuberculosis mortality rate has fallen more rapidly in the areas of nonuse than in the areas where vaccine is given; therefore, it seems evident that there are other factors which are of equal or greater importance than vaccination per se.

There is disagreement on the methods of preparation, standardization, and administration of BCG. There is disagreement on the point whether tuberculin allergy means immunity, and if immunity exists, what its mechanism may be and what its duration may be. Studies have been poorly controlled. It is obvious that the value of the tuberculin test as a diagnostic and case finding method is lost when vaccination is used.

In this country, the United States Public Health Service has made a serious effort to establish studies with adequate controls. A recent note by Palmer and Shaw[1] indicates the status of these studies. Although it appears that the vaccinated groups have a slight advantage, the technical problems of mass utilization still exist.

It appears that the use of this agent in this country will be limited to those who are exposed to infection, such as doctors, nurses, and attendants, and to persons facing exceptional opportunity for exposure. In its present form, nationwide acceptance does not seem likely.

XI. Public Health Aspects

BEN PRIMER, M. D., Austin, Texas

WITH mass community roentgen-ray surveys annually screening out the active cases, increased expansion of sanatorium bed capacity, widespread use of surgery and chemotherapy in treatment, and educational campaigns moving along at ever increasing tempo, it is easy to come up with the erroneous impression that the tuberculosis problem is about solved. The cruel truth is, however, that the tubercle bacillus still kills more people between the ages of 15 and 35 years than any other infectious disease.

Our true progress in the fight is difficult to assess, but as long as there are literally thousands of active germ-spreading cases among the population, we are yet in grave danger from the disease. Because of incomplete reporting of cases, the number that exists at any given time can only be estimated; but on the basis of such estimates, the number appears to be falling slowly.

Particularly within the past ten years, advances in the knowledge of control and of treatment have resulted in a larger and larger number of persons with advanced tuberculosis surviving into the later years of life in which heart disease, cancer, and even highway accidents account for their deaths in such manner that their tuberculosis is not recorded in the death report. This means that the disease is retreating into this older age group of the population where some of it is lost to statistics, but the germs are stored there long enough to be disseminated to many contacts in fresh infections. So, although we look with pride on our "falling death rate" in tuberculosis, we must not interpret it erroneously to mean a corresponding decrease in the prevalence of infection.

WHAT OF THE FUTURE?

The effort to control tuberculosis is supported by several independent groups. The most active units engaged in the effort are state and local tuberculosis associations; local, state, and federal public health services; and the medical profession. Perhaps the greatest need of the moment is the more efficient coordination of the members of the team. The community survey with microfilm succeeds in disseminating much information and arouses considerable interest while it is finding new cases, but as a control device it leaves much to be desired. What is needed is a steady, year round program into which all interested groups can be integrated and utilized to the fullest possible extent of their efficiency. Goals badly needed are the following:

1. Roentgen-ray examination of all hospital admissions.
2. Annual roentgen-ray examination of
   a. All hospital personnel.
   b. All food handlers.
   c. All domestics, including baby sitters.
   d. All public school personnel.
3. Annual health educational program on tuberculosis in all high schools.
4. Isolation and medical supervision of every known case of the disease in the community and follow-up of all contacts.
5. Closer cooperation of the medical profession in reporting cases to the health department.
6. Wider use of the tuberculin skin test in office examinations, especially of children and young people, and the family follow-up examinations of positive reactors.

2709 Rio Grande.

XII. Challenge of the Future

L. C. PAGGI, M. D., Austin, Texas

THE effective control of the tuberculosis problem depends, in essence, on three points:

1. A program of public and professional education regarding the disease, its mode of spread, its prevention, and the essentials of successful treatment.

2. A systematic and well integrated medical program that encompasses early detection, prompt adequate treatment, and follow-up rehabilitation and continuous medical supervision.

3. Research in all phases of the disease.

This certainly is not the time for us to pause and congratulate ourselves on a job well done. If a pause is made, it should be for a stock-taking to determine where we are and what we must do about this problem in the future. There is no doubt that an appreciable measure of success already has been achieved with the vastly improved methods of detection and treatment we now have at hand, and there is every reason to assume that even better methods will come along with increasing rapidity. Our immediate challenge, therefore, is to determine the best and most effective use of the tools now at our disposal and to put them to work at once to the fullest extent of our abilities.

IMMEDIATE PROBLEMS

Some of the immediate major problems in Texas yet to be solved are the following:

1. How to overcome the delay in admissions to the sanatoriums (an average of six weeks to four months). This delay results in increase in the contact infections in the community, further advance in the stage of the disease while the patients wait for admission, longer hospitalization when patients are finally admitted, and death of some patients while awaiting admission.

2. How to get nursing care and chemotherapeutic care to patients awaiting admission to the sanatoriums. Adequate treatment is often impossible because of financial difficulties in securing drugs and difficulty in getting the drugs to the patients and because of the usual unavailability of close medical supervision of those who receive the drugs and skilled care in the administering of these drugs.

3. How to effect the best use of the hospital beds available. The best use of available facilities is not always made because patients are admitted in the order that they appear on the waiting list and the waiting lists are not arranged to recognize the greater needs of some individual patients—those that are the greatest health hazards.

4. What to do about the understaffing of tuberculosis sanatoriums with regard to professional and nonprofessional nurses, doctors, and other technical personnel. These Texas hospitals have a total capacity of 2,253 beds. One has six graduate nurses, one has three, and the other has none.

5. What to do about the unavailability of needed special services at these hospitals. For instance, there are no facilities for the care of pregnant tuberculous patients and no delivery room services.

6. How to change the main factors that contribute

to the high mortality and morbidity rate from tuberculosis. These include lack of education, large families with insufficient incomes and low living standards, and other environmental factors.

7. How to coordinate better all services to the tuberculosis patient. This problem includes:

a. Better cooperation of physicians with community case finding programs and more complete processing of referred cases. There are still many people dying with tuberculosis that is diagnosed only at death.

b. Efforts of all concerned to get every case under medical supervision and in isolation.

c. Better cooperation of physicians with sanatorium staffs in loaning roentgenograms on referred patients and in forwarding case summaries when requested.

d. More careful diagnosis of cases prior to requests for admission to the sanatoriums. Patients are still being admitted who do not have tuberculosis. The result is delay in admission of more needy patients and unnecessary waste, financial and otherwise.

e. Better cooperation between physicians and others in arranging medical supervision of patients allowed to go home.

f. Lack of proper care in reporting of cases by physicians to the proper authorities. Texas law requires this reporting, a fact not generally remembered. As a general rule, the cases reported now are in an earlier stage of the disease than were those in past years.

CHALLENGES FOR FUTURE

In addition to these problems, there are many other challenges that must be met." These include:

1. Choosing between communitywide case detection methods and case finding programs in selected groups, the latter of which gives higher yields. However, the cases so found account for only a fraction of the total unknown infectious cases in the community.

2. Choosing between the hospitalizing of patients throughout the entire period of chemotherapy, thus giving greater assurance of complete and permanent recovery and maximum protection to the public, and reducing the period of dislocation of family and community life.

3. Choosing between compulsory hospitalization of all "uncooperative" infectious patients and a sympathetic determination of the reasons for such behavior, this to be done by social workers skilled in psychiatric techniques and followed by attempts to remove the underlying causes. One wonders what would be done to care for these patients if compulsory hospitalization is made a law. Our facilities are already very strained.

Some of the remarks Dr. James Perkins, managing director of the National Tuberculosis Association, made recently[1] seem apropos. In his article, he gives his views on some of the more long range challenges as follows:

1. "Is it possible to prepare a vaccine which will be cheap and which will give a high degree of immunity, be absolutely safe, devoid of toxic reactions, and which can be given to everyone regardless of his reaction to tuberculin?"

2. "Will treatment drugs, better than those now available, be devised? Is it possible that a drug will be developed, so effective and non-toxic that it can be used essentially like a vaccine, a drug which will eliminate infection in the infected and produce resistance to the disease in the uninfected?"

3. "Even in the absence of a super vaccine or a super drug, can the factors involved in resistance to tuberculosis be determined precisely and applied practically as a shortcut in the attempt to eradicate tuberculosis? For example, could those nutritional elements which enhance resistance be isolated and developed to the point where they could, perhaps, be administered widespread in concentrated form to prevent the development of infection or active disease?"

In the absence of such theoretical advances in the future, are we going to be able to maintain the progress already made, forge ahead, and complete the job so nobly begun, or are we to allow a resurgence of the tuberculosis problem by disinterest and neglect of these patients? Recently "Searchlight on TB," a statewide study by the Texas Tuberculosis Association, has gotten under way to bring to light the tuberculosis problem in every community in our state. County committees will be searching for information that only the physician can give. It is important that each of us does his part to help bring out the facts surrounding tuberculosis and its victims in our own communities. We now stand at the crossroads of opportunity. Are we ready and willing to do our part?

404A West Fifteenth.

In the period from the end of World War II to early 1950, an average of approximately 400,000 persons per year earned Red Cross First Aid Certificates. From early 1950 (when Civil Defense began operations) to mid-1952, an average of about 1,000,000 persons per year were earning such certificates. The number of instructors in First Aid tripled in that time.

Physicians per Persons

On the basis of an estimated United States population of 160,000,000 in 1953, there is one physician actually engaged in the practice of medicine for every 1,000 persons. There are 220,104 physicians in the United States today, 156,433 of whom are in active practice, the American Medical Association reports.

LIPID PNEUMONIA

W. S. THOMAS, M. D., F.A.C.P., Rochester, New York

IN SPITE of the fact that it has been known for twenty-five years that mineral oil when aspirated may cause serious lesions in the lungs, it is still prescribed by physicians more or less indiscriminately and is perhaps the substance most commonly used by the layman in self medication.

As evidence that this man-made disease, as Cannon[1] calls it, is not unimportant, one might mention the reports of more than 500 cases in the literature. I have observed 107 cases in less than 2,000 autopsies performed on my service in a county hospital in the past fifteen years.

It is not the purpose of this paper to describe these cases but to review briefly the subject of oil aspiration pneumonia, to point out the potential danger in the use of oil, and to emphasize the necessity for keeping in mind the lesion in differential diagnosis in order to avoid errors which have all too often caused much harm to the patient.

The first description of the baleful effects of the aspiration of mineral oil was by Laughlen in 1925.[6] He found a peculiar exudate of macrophages filled with oil droplets in the lungs of infants who died of pneumonia and who, as part of their treatment, had had nose drops in which mineral oil was used as a base. He followed this observation by the experimental production of the lesion in rabbits by instilling the oil into their tracheas.

It was in the same year that I observed my first case,[15] that of a young man who entered the hospital suffering from cardiospasm. He was in a state of starvation from his inability to swallow anything except liquids and these in small quantity. His physician prescribed cream as a food with a high caloric value and in liquid form. The patient developed a mediastinitis following an esophagoscopy. Morphine was given for the relief of pain, and while asleep, the patient evidently aspirated a large amount of the cream from the much dilated esophagus, for at autopsy both lungs showed large areas of consolidation with the exudate of macrophages filled with oil droplets as in Laughlen's cases instead of the polymorphonuclear leukocytes usually seen in pneumonia.

DANGERS

It not infrequently happens that some keen observer publishes a description of a lesion of a type which has been in existence for a long time but has been overlooked. Such was the case in this disease, and when pathologists reviewed autopsy material, they found a considerable number of previously overlooked lesions.

There is now a voluminous literature on the subject, and many warnings[3, 7, 8, 10, 13] have been published on the dangers of promiscuous use of oil. The Council on Pharmacy and Chemistry of the American Medical Association voted to omit mineral oil nose drops from the list of new and nonofficial remedies.[11]

It appears that some good has been accomplished since the number of papers on the subject has decreased in the past few years. Physicians for the most part have ceased writing prescriptions for nose drops with an oil base, but I am told by a pharmacist friend that one of the most popular nose drops sold to laymen contains the oil.

The condition has a variety of names, the most common being lipid pneumonia, lipoid pneumonia, oil pneumonia, oil aspiration pneumonia, and pneumolipoidosis. Lipid pneumonia is accepted by *The Journal of the American Medical Association,* but I prefer the term oil aspiration pneumonia.

While emphasis is placed on mineral oil, the animal oils and fats must not be ignored. No less than 23 per cent of the cases described have been produced by cod liver oil and 5 per cent by butterfat (milk and cream). Only 4 per cent are due to the vegetable oils, these with a few exceptions being harmless.

The vast majority of the cases have occurred in infants of 1 to 3 years of age and in adults of 50 years or older, for it is in these age groups that oils are given most often. Nose drops with a mineral oil base and cod liver oil are given in cases of the infant, and mineral oil generally is used as a laxative in the adult.

It has been emphasized in the many publications that mineral oil is particularly dangerous when given to the debilitated patient and to the person with difficulty in swallowing. This undoubtedly is true, but recently a paper by Schneider[16] brought to attention a number of healthy adults who because of the absence of the gag reflex have inhaled the oil with serious lesions resulting. He reported 7 cases with severe lesions demonstrated by roentgen ray in otherwise healthy adults who had been in the habit of taking mineral oil as a laxative.

Schneider found in all of these patients the gag reflex either absent or greatly subdued. He believed

Read before the Section on Clinical Pathology, Texas Medical Association, Annual Session, Houston, April 29, 1953.

LIBRARY OF THE COLLEGE OF PHYSICIANS

that either many such cases were overlooked altogether or, when lesions were found by roentgen ray, the cause was not recognized and therefore erroneous diagnoses were made.

Mineral oil is a bland substance and can trickle down the trachea without producing the violent coughing reflex generally seen when a foreign substance gains entrance to the lower respiratory tract.

Following the publication of Schneider's case my interest waned, but it was renewed on my coming to the county hospital, where I found characteristic lesions in more than 5 per cent of the patients coming to autopsy.

Upon inquiry I learned that mineral oil was the drug of choice as a laxative and furthermore was told by the chief resident that a county hospital could not be run without mineral oil. He was shown to be wrong, for at the present time oil rarely is used and never in nose drops or as a laxative. We still encounter the disease at the county hospital, though less often, but the patients have had oil before coming to us.

TYPES OF LESION

Ikeda[4] has shown that there are two distinct types of lesions which he called the infantile and adult but which I prefer to call the acute and chronic. In the acute or infantile type there is only the exudative reaction in which the lesion is characterized by an exudate of monocytes or macrophages filled with oil droplets. In this stage the lesion is reversible; in other words, if the administration of the oil is stopped, the lungs will return to normal. In the adult or chronic type there is a foreign body or granulomatous reaction in which there is marked connective tissue proliferation causing the formation of a solid tumor-like mass, a paraffinoma to use Ikeda's[4] terminology. The mass shows up readily on examination of the chest by roentgen ray and so closely resembles a tumor that several instances have been reported in which lobectomies have been performed following a diagnosis of carcinoma.[5, 14, 17] There have been 2 such happenings in my own community within the past year, and I am sure there have been others which have not been nor will be reported.

That such things happen is sufficient reason, it seems to me, to have the lesion in mind in order to avoid such mistakes or, as Schneider[16] pointed out, if we are suspicious enough, we will recognize these lesions for what they are.

Symptoms of the lesion are variable, none characteristic; indeed they are protean and may simulate almost any lung disease. In infants symptoms are those usually seen in bronchopneumonia, perhaps with less fever. Where there is a history of protracted bronchopneumonia or repeated attacks in a child stunted in growth with failure to gain weight, oil pneumonia should be suspected.

In adults, in whom the chronic type occurs as a rule, the onset is insidious. One may find a persistent hacking cough, rapid respiration with some dyspnea, and perhaps occasional cyanosis. There is no fever unless the condition is complicated by infection, which sometimes occurs; indeed, formation of abscesses has been observed. There may be loss of weight or failure to gain weight. There may be congestive heart failure if the fibrosis is marked.

DIAGNOSIS

The diagnosis is not easy and may be extremely difficult. The roentgen ray is of the greatest help; the roentgenographic shadow, however, as in the case of the symptoms, is not characteristic and may be mistaken for a variety of conditions, including cancer, as has been mentioned.

With the ever increasing search for tuberculosis by means of the roentgen ray, more and more of these shadows are being found, and it is imperative that we use every means at our disposal to differentiate the paraffinoma from cancer.

Generally, the shadow is bilateral and most often in the lower lobes, in which case there is less likelihood of its being mistaken for a malignancy. Where it is unilateral and there is a history of the mineral oil habit, the physician should examine the sputum for oil and/or resort to aspiration of the consolidated area.

Examination of the sputum may be of much value, but it must be done with care. Losner[9] and his coworkers recommended that the patient be placed on a fat free diet from four days to a week and that twenty-four hour specimens of the sputum be collected for three to five days. To examine the sputum they place a drop of it on a slide, dry it in the incubator, and stain it with Sudan IV. In some instances the oil is found in such quantities that it may be recognized as a top layer in the twenty-four hour specimen.

Aspiration of the lung by needle is more serious but is recommended by some[2, 12] who claim that it is not a difficult procedure. I have had no experience with the method, but I think it should be tried before an exploratory thoracotomy is done.

There is no satisfactory treatment for the lung lesion. In some cases in which the fibrosis is not too extensive, the process is reversible to some extent if the use of oil is discontinued. There are few cases in which lobectomy is justified. The treatment is chiefly prophylactic.

Rather than discard mineral oil altogether as a

drug (which is not a bad idea), the following rules which have been taken from various sources can be followed with benefit: (1) do not use nose drops having an oil base, (2) do not give oils to patients with dysphagia, (3) do not give oils to anyone just before he retires, (4) use oils with caution on all bedridden patients, (5) use oils with caution on patients with subdued reflexes, (6) use oils with caution on all debilitated persons, and (7) use oils with caution in infants.

SUMMARY

Oil aspiration pneumonia is an insidious disease and seldom diagnosed clinically.

Every care must be used in the patient in whom a unilateral shadow in the lung is shown by roentgen ray so as not to mistake the lesion for a carcinoma and advise lobectomy. On the other hand the physician must be careful not to bypass a carcinoma by making the diagnosis of oil aspiration pneumonia and deprive the patient of his chance of survival.

Texas State Board of Medical Examiners, Fort Worth, June 21-23, 1954. Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth, Sec'y.

TEXAS AIR-MEDICS ASSOCIATION

Dr. John S. Minnett, Dallas, assumed the presidency of the Texas Air-Medics Association at the group's meeting May 2-3 in San Antonio. Other officers are Dr. W. A. Ostendorf, Fort Worth, president-elect; Dr. C. F. Miller, Waco, secretary-treasurer; and Dr. W. D. Marrs, Fort Worth, new director.

The program was presented as announced in the March *Journal*. Approximately twenty-five members attended. Dr. T. H. Sutherland, Marion, Ohio, secretary of the Aero Medical Association, reported on the activities of that organization.

The meeting concluded with guided tours of the Bacteriology, Pharmacology, and Physiology Departments of the School of Aviation Medicine, Randolph Field. In each department a lecture regarding problems of aviation medicine was given.

TEXAS SOCIETY OF PATHOLOGISTS

A new scholarship at the University of Texas Law Science Institute was created by the Texas Society of Pathologists at its May 3 meeting in San Antonio. To begin in September, 1954, the project is limited strictly to investigation of the present coroner-justice of the peace system, with plans and procedures to be proposed for establishment of a modern medical examiner system.

A unanimous directive to the officers called for proceeding with incorporation by seeking a charter from the Secretary of State of Texas at an early date.

The members individually contributed nearly $1,000 to assist in the expenses of the approaching third International Congress of Clinical Pathology to be held in Washington, D. C., September 6-10.

Dr. Harold D. Palmer, Denver, guest of the Texas Medical Association and pathologist, addressed the society on both scientific and general subjects. The program was presented as outlined in the March *Journal*, and fifty-two physicians attended. The group will meet at the Southwestern Medical School of the University of Texas, Dallas, on January 30, at which time new officers will be elected.

Texas Chapter, American College of Chest Physicians

Dr. William A. Hudson, Detroit, president-elect of the American College of Chest Physicians, delivered the first Charles M. Hendricks Memorial Address at the May 2 meeting in San Antonio of the Texas Chapter of the national group. The remainder of the program, including a luncheon address by Dr. Alvis E. Greer, Houston, national president, was presented as printed in the March *Journal*.

Dr. Howard E. Smith, Austin, was elected president; Dr. Samuel Topperman, Tyler, first vice-president; Dr. Walter C. Brown, Corpus Christi, second vice-president; and Dr. John Wiggins, Fort Worth, secretary-treasurer.

The group adopted resolutions to the memory of Dr. Charles M. Hendricks of El Paso and Dr. R. G. McCorkle of San Antonio, both of whom died within the past year.

Dr. Henry R. Hoskins, San Antonio, president for 1953-1954, presented a certificate from the Texas Chapter to Dr. Hudson in commemoration of the first Charles M. Hendricks Memorial Address.

Approximately fifty members registered for the meeting, and a number of guests were present.

Texas Neuropsychiatric Association

Dr. Edgar S. Ezell, Fort Worth, was elected president of the Texas Neuropsychiatric Association at the group's May 2 meeting in San Antonio, and other officers were elected as follows: Dr. Howard Burkett, Dallas, first vice-president; Dr. William B. Cline, Jr., Corpus Christi, second vice-president; and Dr. Bruce H. Beard, Fort Worth, secretary-treasurer.

As a part of the scientific program, which was presented as outlined in the March *Journal*, Dr. Tracy J. Putnam, Beverly Hills, Calif., delivered two talks.

Business transacted at the meeting included the appointment of a committee, headed by Dr. Ezell, to draw up a resolution directed to Dr. James Bethea and Governor Allan Shivers stating that the association favors an increase in the budget to allow for a minimum expenditure of $3 per day per patient in the state mental hospitals; the appointment of Dr. Hamilton Ford of Galveston, Dr. Stephen Weisz of Dallas, and Dr. David Wade of Austin to organize teams for in-service training in state hospitals; a discussion of the mental health fund-raising drive; and the decision to invite the Mexican Neuropsychiatric Association to meet with the Texas group in Galveston in the fall, with Dr. M. L. Towler of Galveston to be in charge of negotiations and arrangements.

Conference of City and County Health Officers

Forty-five local health officers attended the annual Conference of City and County Health Officers May 3 in San Antonio. Dr. Gordon W. Grace, Los Angeles, and others named in the March *Journal* presented the program.

Dr. Henry A. Holle, new State Health Officer for Texas, was introduced by Dr. George W. Cox and commented on the past and future public health programs in Texas. Dr. Holle is the new chairman of the conference.

Texas Railway and Traumatic Surgeons

Sixty members of the Texas Railway and Traumatic Surgical Association attended the group's meeting May 3 in San Antonio and took part in the scientific program printed in the March *Journal*. Dr. Raleigh R. White, Temple, was elected president; Dr. Albert O. Singleton, Jr., Galveston, first vice-president; Dr. J. H. Dorman, Dallas, second vice-president; and Dr. W. D. Marrs, Fort Worth, secretary-treasurer.

TEXAS DIABETES ASSOCIATION

In conjunction with the annual session of the Texas Medical Association, the Texas Diabetes Association met May 2 in San Antonio and heard the scientific program outlined in the March *Journal*. More than 100 members and guests attended.

New officers elected are Dr. George M. Jones, Dallas, president; Dr. Lawrence B. Reppert, San Antonio, first vice-president; Dr. W. S. Barcus, Fort Worth, second vice-president; Dr. Hugo Engelhardt, Houston, secretary-treasurer; and Dr. David W. Carter, Jr., of Dallas, Dr. Merton M. Minter of San Antonio, and Dr. Ivan G. Mayfield of Lubbock, councilors.

TEXAS SOCIETY OF ANESTHESIOLOGISTS

Approximately eighty members of the Texas Society of Anesthesiologists attended the group's May 2 meeting in San Antonio. The new slate of officers includes Dr. Frank O. Barrett, El Paso, president; Dr. Joe B. Wood, Dallas, president-elect; Dr. Charles R. Allen, Galveston, vice-president; and Dr. Milton Rosenzweig, San Antonio, secretary-treasurer.

Dr. James Robinett, Houston, and Dr. Rosenzweig, were elected delegates to the American Society of Anesthesiologists; Dr. Eugene Slataper, Houston, and Dr. M. D. Thomas, El Paso, were elected alternates.

The program printed in the March *Journal* was presented. Dr. Digby Leigh, Vancouver, B. C., Canada, was a special guest.

TEXAS ORTHOPEDIC ASSOCIATION

The Texas Orthopedic Association met in San Antonio May 3 and elected Dr. Brandon Carrell, Dallas, president; Dr. Duncan C. McKeever, Houston, vice-president; and Dr. Margaret Watkins, Dallas, secretary-treasurer.

The program was presented as outlined in the March *Journal*. Special guest was Dr. William T. Green, Boston. Approximately forty members attended.

New members of the group follow: Lt. Col. Herbert E. Block, Lackland Air Force Base, San Antonio; Col. R. S. Brau, Lackland Air Force Base, San Antonio; Dr. G. V. Carroll, Houston; Dr. Richard DeYoung, Houston; Dr. Richard Leong, Houston; Dr. Alfred E. Luckett, El Paso; Dr. William T. Payne, Dallas; Dr. Thomas Shindler, Houston; and Dr. Richard L. Shorkey, Beaumont.

UNIVERSITY OF TEXAS ALUMNI ASSOCIATION

Alumni of the University of Texas Medical Branch held a dinner meeting May 3 in San Antonio, with Dr. Kleberg Eckhardt, Corpus Christi, vice-president, presiding in the absence of Dr. Tom M. Oliver, Waco, president.

Dr. Howard O. Smith, Marlin, became president for 1954-1955, and other officers were elected as follows: Dr. Eckhardt, president-elect, Dr. L. Bonham Jones, San Antonio, vice-president; and Miss Mildred M. Robertson, Galveston, secretary-treasurer.

Guest speaker of the evening was Dr. Titus H. Harris, professor of neuropsychiatry. Colored slides of the new buildings and of other campus views were shown.

Dr. G. G. Passmore, San Antonio, was in charge of arrangements.

Texas Dermatological Society

Dr. Paul H. Power, Waco, was elected president; Dr. William F. Spiller, Galveston, vice-president; and Dr. Thomas L. Shields, Fort Worth, secretary, when the Texas Dermatological Society met May 3 in San Antonio. The program printed in the March *Journal* was presented. Eighty-five members and guests attended.

Texas Geriatrics Society

The organizational meeting of the Texas Geriatrics Society was held in San Antonio May 3, with Dr. Henry H. Niehuss of Longview serving as temporary president.

The sixteen doctors present heard Dr. Niehuss discuss what had been done to date regarding the organization of the society, Dr. F. J. L. Blasingame of Wharton express a favorable opinion of beginning such an organization in Teaxs, and Dr. Charles R. Gowen of Shreveport state that he intended to see that a geriatrics society was organized in his state.

Those who joined the society before July 10, Dr. Niehuss explained, would be charter members. He expected the membership to reach a hundred.

Officers were elected as follows: Dr. Niehuss, president; Dr. Gowen, vice-president; and Dr. Frank V. Mondrik, Longview, secretary-treasurer.

The group voted for the present to meet twice a year, once in conjunction with the Texas Medical Association's annual meeting and the other time in the fall, the date and place to be determined later. Other business carried out at the meeting included the appointment of Dr. Hugh P. Revely of San Antonio as chairman of the membership committee.

FIFTY YEAR CLUB

Twenty-five members of the Fifty Year Club attended the group's May 4 breakfast meeting in San Antonio. Dr. George Turner, El Paso, President of the Texas Medical Association; Dr. R. G. Baker, Fort Worth, chairman of the Board of Councilors; and Dr. William Crawford, Fort Worth, were guests.

With Dr. L. H. Reeves, Fort Worth, secretary, presiding in the absence of Dr. W. M. Brumby, Houston, founder and president, new officers were elected. Dr. Brumby became life president, and Dr. Felix Miller of El Paso was elected vice president and Dr. Reeves, secretary.

The presentation of slides picturing some deceased physicians of Texas concluded the program.

PAST PRESIDENTS' ASSOCIATION

The Past Presidents' Association held a luncheon meeting on May 3 in San Antonio with eleven members and two honorary members present.

Guests included Dr. J. M. Travis, Jacksonville, secretary of the Texas Medical Association; Dr. R. G. Baker, Fort Worth, chairman of the Board of Councilors; Dr. F. J. L. Blasingame, Wharton, incoming President; Dr. George Turner, El Paso, outgoing President; Dr. and Mrs. H. O. Deaton, Fort Worth, who presented a musical program; Mr. Philip Overton, Austin general counsel of the association; and Mr. N. C. Forrester, Austin, executive secretary.

Dr. Felix Miller, El Paso, was elected president, and Dr. T. C. Terrell, Fort Worth, was elected vice-president. Dr. L. H. Reeves, Fort Worth, is permanent secretary of the Association.

University of Arkansas Alumni

The dean of the University of Arkansas School of Medicine, Dr. Hayden C. Nicholson, Little Rock, was principal speaker at the organizational meeting of the Texas alumni of the school May 3 in San Antonio. Twenty-four persons attended the cocktail party and dinner.

Officers were elected as follows: Dr. William M. Center, San Antonio, president; Dr. Mark L. Welch, Dallas, vice-president; and Dr. Grace A. Beasley, Fort Worth, secretary-treasurer.

PAST PRESIDENTS' ASSOCIATION

THIS page is dedicated to the physicians who as past presidents of the Texas Medical Association or as practitioners for fifty years or more have done so much to make Texas medicine what it is today. It is also dedicated to their friends, Dr. Holman Taylor and Dr. R. B. Anderson, Jr., who, as secretary-editor from 1910 to 1947 and assistant secretary-editor from 1927 to 1947, respectively, helped the Association to serve its members effectively.

TAYLOR-ANDERSON TREE

The Past Presidents' Association with guests at its May 3 meeting in San Antonio is pictured above.

The Spanish oak planted at the entrance to the Texas Medical Association building in Austin by Dr. L. H. Reeves of Fort Worth in memory of Dr. Taylor and Dr. Anderson is in the center.

The Fifty Year Club with guests convening May 4 in San Antonio appears below.

FIFTY YEAR CLUB

Texas Heart Association

Membership in the Texas Heart Association has more than doubled in the past year and now numbers 563. Approximately 175 attended the group's meeting May 3 in San Antonio and were presented with the scientific program as printed in the March issue of the *Journal.* Special guest speaker was Dr. Myron Prinzmetal, Los Angeles, who appeared on the program twice.

The new slate of officers follows: Dr. George R. Herrmann, Galveston, president; Dr. Kleberg Eckhardt, Corpus Christi, president-elect; Dr. George E. Clark, Jr., Austin, vice-president; Douglas B. Marshall, Houston, chairman of the board; and R. L. Thomas, Dallas, secretary-treasurer.

State headquarters of the association will move to the Jesse H. Jones Library Building, 1133 M. D. Anderson Boulevard, Houston, as soon as the building is completed, probably by July 1.

At the awards dinner May 2, certificates were presented to the past presidents and others who had given outstanding service during the nineteen years of the association's existence. The following past presidents were awardees: Dr. C. M. Grigsby (deceased); Dr. Edward H. Schwab, Galveston; Dr. David W. Carter, Jr., Dallas; Dr. Joe Kopecky, San Antonio; Dr. H. K. Beall (deceased); Dr. Charles T. Stone, Sr., Galveston; Dr. Marvin L. Graves (deceased); Dr. Victor E. Schulze, San Angelo; Dr. Robert M. Barton, Dallas; Dr. DeWitt Neighbors, Fort Worth; Dr. Walter B. Whiting, Wichita Falls; Dr. Merritt B. Whitten, Dallas; Dr. George W. Parson, Texarkana; Dr. Paul V. Ledbetter, Houston; Dr. J. C. Crager, Beaumont; and Dr. Joseph F. McVeigh, Fort Worth.

Other awardees were Douglas B. Marshall, Houston; S. E. McCreless, San Antonio; Ben H. Wooten, Dallas; R. L. Thomas, Dallas, DeWitt T. Ray, Dallas; W. R. White, Th.D., Waco; C. F. Carter, Houston; John Ben Sheppard, Austin; and Governor Allan Shivers, Austin.

Receipts of $385,527 in the 1954 Heart Fund campaign were reported at the time of the meeting.

POSTGRADUATE MEDICAL ASSEMBLY OF SOUTH TEXAS

The twentieth annual meeting of the Postgraduate Medical Assembly of South Texas will be at the Shamrock Hotel, Houston, July 19-21. Included in the three-day meeting will be scientific programs, luncheons, scientific and technical exhibits, and special entertainment for the ladies.

Out-of-state speakers include Drs. Edgar Burns, New Orleans; Frederick B. Campbell, Kansas City; Ramon Castroviejo, John J. Conley, Franklin M. Hanger, and Gordon McNeer, New York City; Matthew S. Ersner and John C. Ullery, Philadelphia; L. E. Harris, Rochester; William K. Keller, Louisville; Clarence S. Livingood, Detroit; A. E. Maumenee, San Francisco; Lester M. Morrison and Myron Prinzmetal, Los Angeles; Duncan E. Reid, Boston; Danely P. Slaughter, Chicago; Donald H. Stubbs, Alexandria, Va.; and I. Snapper, Brooklyn.

Physicians who are members of their county medical societies are invited to participate in the meeting.

College of Surgeons in District Meeting

The American College of Surgeons, fifth district chapter of Texas, will hold a scientific session in the auditorium of the new Houston Academy of Medicine Library Building on July 17. This meeting will be prior to the Postgraduate Medical Assembly of South Texas, which meets July 19-21.

PERSONALS

Dr. Charles T. Stone, Sr., Galveston, spoke on "Cardiac and Renal Reserve in the Aged as Related to Operability" at the eleventh annual meeting of the American Geriatrics Society, San Francisco, June 17-19.

Dr. Michael E. DeBakey, Baylor University College of Medicine, Houston, was one of two surgeons to receive the Rudolph Matas Award in Vascular Surgery.

Dr. Arthur Grollman, Dallas, was a guest speaker at the seventy-third annual meeting of the South Dakota State Medical Association in Huron, May 16-18.

Dr. G. W. N. Eggers, Galveston, is spending six to eight weeks in the Far East as a consultant in orthopedic surgery at the invitation of the surgeon general of the Army.

Dr. T. H. Thomason, Fort Worth, and *Dr. H. O. Deaton,* Fort Worth, were appointed honorary Texas generals by State Senator Gus Strauss, Hallettsville, who was Acting Governor on April 4. *Dr. F. J. L. Blasingame,* Wharton, was appointed an honorary Texas admiral by the Senator.

Dr. and Mrs. William Smith and their four children have been chosen one of the two Texas Presbyterian "Families of the Year." A write-up about the Smiths appears in the May 1 *Texas Presbyterian.*

Dr. W. G. Maddox, Denton, spoke recently to the School Health Services section meeting of the District Five State Teachers Association convention at Texas State College for Women.

Dr. John S. Bagwell, Dallas, has been named to fill a vacancy on the Highland Park Board of Education.

Dr. Joe D. Nichols, Atlanta, was the main speaker at a dinner in honor of the Mississippi legislature in Jackson.

Dr. Frank J. Altick, Dallas, was recently named to the board of directors of Mid-Texas Trust and Insurance Securities Corporation, Dallas.

According to the *Alumni Bulletin* of the University of Texas Medical Branch, parents of new girls are *Dr. and Mrs. Paul de Mesquita,* Galveston, whose daughter was born in February; *Dr. and Mrs. George V. Miller,* Houston, April 4; *Dr. and Mrs. Rider Stockdale,* Jasper, March 12; and *Dr. and Mrs. D. M. Carnes,* Ysleta, November 23, 1953.

The Tarrant County Medical Auxiliary *Stethoscope* announces the birth of girls to the following Fort Worth couples; *Dr. and Mrs. John Jernigan,* April; *Dr. and Mrs. Melvin Johnson,* April 12; and *Dr. and Mrs. Robert Holmgren,* April 7.

UNIVERSITY OF TENNESSEE ALUMNI

Dr. L. H. Reeves, Fort Worth, will again serve as president of the Texas alumni of the University of Tennessee. He first held the office in 1914 and was elected this year at the May 3 meeting in San Antonio. Dr. Robert D. Moreton, Fort Worth, was elected vice-president and Dr. S. W. Thorn, Houston, secretary.

Dr. J. B. Cummins, 95 year old Fort Worth practicing physician, was among the twenty-eight members present, as were Dr. J. E. Robinson of Temple and Dr. H. A. White of Corpus Christi.

Many wives also attended the banquet-meeting.

Rocky Mountain Cancer Conference

The eighth annual Rocky Mountain Cancer Conference will be in Denver, July 14 and 15, with eight guest speakers bringing the scientific programs. This meeting is sponsored jointly by the Colorado Division of the American Cancer Society and the Colorado State Medical Society. A program and additional information can be obtained from Rocky Mountain Cancer Conference, 835 Republic Building, Denver 2.

CORRECTION: ASTEROL ENCEPHALOPATHY

Some of the laboratory data in the case report appearing with the article entitled "Asterol Encephalopathy" by Drs. Morris William Rosenthal and Robert J. Goodall on page 303 of the May, 1954, JOURNAL were incorrectly stated.

The first portion of the third paragraph of the case report should read: "Laboratory work revealed a normal hemogram and normal urinalysis. Analysis of fluid from a lumbar puncture was reported as yielding 4 cells, 3 lymphocytes and 1 polymorphonuclear leukocyte; 65 mg. of sugar per 100 cc.; 186 milliequivalents of chloride per liter; and 125 mg. of total protein. On June 27 the serum calcium level was reported as 5.75 milliequivalents per liter."

The last paragraph of the case report should begin: "A repeat lumbar puncture on July 1 was reported as revealing 1 cell (lymphocyte); sugar 59 mg. per 100 cc.; chloride 120 milliequivalents per liter; protein 40 mg. per 100 cc."

Baylor Medical Alumni

The Baylor Medical Alumni Association met in San Antonio on May 3 with Dr. Frank Kidd presiding at the meeting of 165 members and wives. Officers elected were Dr. C. C. Shotts, San Antonio, president-elect; Dr. Russell Deter, El Paso, first vice-president; Dr. J. C. Holsomback, Baytown, second vice-president; Dr. J. C. Haley, Houston, secretary-treasurer; and Dr. H. H. Harris, Houston, faculty representative. Dr. C. M. Bielstein, Oklahoma City; Dr. L. E. Shirley, Jennings, La.; and Dr. Steve Marshall, Roswell, N. Mex., were elected representatives at large. Dr. R. H. Harrison, Bryan, is now president of the group.

Gastroenterologists and Proctologists

The Texas Society of Gastroenterologists and Proctologists met in San Antonio and elected Dr. Charles Hardwicke, Austin, president. Other officers elected were Dr. Edward J. Lefeber, Galveston, first vice-president; Dr. Robert J. Rowe, Dallas, second vice-president; and Dr. William T. Arnold, Houston, secretary-treasurer.

The program was held as outlined in the March Journal, with 175 physicians attending.

Life Insurance Medical Directors

The Society of Life Insurance Medical Directors of Texas met in San Antonio and had 15 members present at the meeting in which Dr. Ghent Graves, medical director of the American General Life Insurance Company of Houston, was elected president.

The fall meeting will be in Dallas during November.

Tulane University Alumni

The Cos House in San Antonio was the scene on May 3 of the alumni party of Tulane University. Miss Beatrice Fields discussed and presented slides of the new buildings on the Tulane campus. Approximately fifty alumni and guests attended the cocktail hour and dinner. Dr. A. Fletcher Clark, Sr., San Antonio, was elected president.

LIBRARY SECTION

RECENT PUBLICATIONS BY TEXAS PHYSICIANS

Following is a list of recent articles published by Texas physicians and available at the Memorial Library of the Texas Medical Association. Articles appearing in the TEXAS STATE JOURNAL OF MEDICINE are not included. If a physician who has had a paper printed in the past six months is not named below, the Library would appreciate being notified. Also, the Library would like to have two reprints of each article.

CONTRIBUTIONS TO LIBRARY

Grateful acknowledgment is made by the Texas Medical Association Memorial Library for the following recent gifts:

Dr. T. J. Archer, Austin, 52 journals.

Austin Anesthesiologists Group, Austin, 87 journals, 16 reprints.

Mrs. A. J. Black, Kerrville, 2 books.

Dr. Clyde H. Crawford, Bartlett, 308 journals, 119 books, 62 pamphlets.

Mrs. Harry J. Leon, Austin, 1 book.

Mrs. J. R. Nichols, Austin, 52 books.

Dr. W. D. Roberts, Austin, 41 journals.

Dr. N. L. Schiller, Austin, 29 journals, 20 reprints.

Dr. John F. Thomas, Austin, 9 journals, 11 books.

Mrs. G. F. Thornhill, Austin, 83 books.

MOTION PICTURES FOR LOAN

Transthoracic Esophageal Diverticulectomy

16 mm., silent, color, 23 minutes.

The patient in this film has a large diverticulum immediately above the diaphragm. A one-stage diverticulectomy with immediate repair of esophagus is presented. The procedure is accomplished transthoracically, with various anatomic landmarks demonstrated. This is an excellent film for county medical societies.

Breast Self Examination

16 mm., sound, color, 15 minutes.

In a concise and sensible manner this film stresses the importance of alertness on the part of the patient. A physician introduces the subject, teaches the woman the method

of examination of her own breasts, and emphasizes repeatedly the importance of periodic check-ups. It is impressed on the patient that should she note any abnormality during the monthly self examination, her physician is the person to pass final judgment. The approach used in the film is excellent, with the material presented in a manner to avoid "cancerphobia." It is made plain that not all lumps are carcinoma but that diagnosis should be left to the physician, not the patient.

BOOK NOTICES

[1]Textbook of Medical Treatment

Edited by D. M. DUNLOP, M. D., F.R.C.P. (Ed.), *Professor of Therapeutics and Clinical Medicine, University of Edinburgh;* L. S. P. DAVIDSON, M. D., F.R.C.P. (Ed.), *Physician to Her Majesty the Queen of Scotland, and Professor of Medicine and Clinical Medicine, University of Edinburgh;* JOHN MCNEE, D.S.O., M. D., D.Sc. (Glas.), *Physician to Her Majesty the Queen of Scotland, and Regius Professor of Practice of Medicine, University of Glasgow. Sixth edition. 1,023 pages. $9.50. Edinburgh and London, E. & S. Livingstone, 1953. Distributed by Williams and Wilkins, Baltimore.*

The object of this book is to present to the student and general practitioner the subject of medical therapeutics in a simple and rational form. This goal is accomplished admirably.

In some diseases in which several methods of treatment are successful the authors have chosen one method and have been explicit in giving the details in such a manner that the student or practitioner without great experience is able to carry out the measures successfully.

Many controversial methods of treatment have been omitted. The various contributors to the writing of the book have been chosen because of their rank as authorities in their respective fields of medicine and surgery in Great Britain.

The discussion of "General Management of the Patient" which includes diet, rest, handling of the relatives, and so forth received more attention than in other textbooks of medicine. This is to be commended because too much emphasis often is put on the administration of pharmaceuticals and little is discussed in regard to the handling of the patient's morale.

This volume will be useful in the library of the student or young practitioner.

Bailey's Textbook of Histology

Revised by PHILIP E. SMITH, Ph. D., Sc. D., *Professor Emeritus of Anatomy, College of Physicians and Surgeons, Columbia University, and* WILFRED M. COPENHAVER, Ph. D., *Professor of Anatomy, College of Physicians and Surgeons, Columbia University. With the Assistance of* DOROTHY D. JOHNSON, Ph. D., *Assistant Professor of Anatomy, College of Physicians and Surgeons, Columbia University. Thirteenth Edition. 776 pages. $9. Baltimore, Williams and Wilkins, 1953.*

The thirteenth edition of this classic has been revised and brought up to date. Changes have been made throughout the text to include new information of nucleic acids, enzymes, histochemistry, physiology, and electromicrography. The references at the end of each chapter have been revised and new material included.

Six new colored plates and eighty-eight halftone and live figures have been added.

The book is primarily for the use of medical and dental students and does not pretend to be a source book.

Its excellent coverage of the field makes it one of the best histology texts available in the field.

[2]Practical Methods in Biochemistry

FREDERICK C. KOCH, *Late Frank P. Hixon, Distinguished Service Professor Emeritus of Biochemistry, University of Chicago, and Late Director of Biochemical Research, Armour and Company, Chicago; and* MARTIN E. HANKE, *Associate Professor of Biochemistry, University of Chicago. Sixth edition. 537 pages. $5. Baltimore, Williams and Wilkins, 1953.*

This is distinctly a laboratory manual in elementary biochemistry. It covers experiments on the different foods, the digestive tract, blood, and urine; and also it covers the more complicated chemistry of different enzymes, vitamins, and hormones. The experiments are well written and well chosen to help in a growing appreciation of elementary biochemistry.

[3]Respiratory Diseases and Allergy; New Method of Approach

JOSEF S. SMUL, M. D., *Formerly Associate Gastroenterologist, Beth David Hospital, and Clinical Assistant Physician, Beth Israel Hospital, New York. 80 pages. $2.75. New York, Medical Library Company, 1953.*

This book of eighty numbered pages is, in the several meanings of the adjective, thin. The allergic bias is obvious and the exposition is superficial. The primary purpose seems to be directed toward validation of the author's coined term "respirallergy" to supplant some "twenty-odd so called 'diseases'." The sections concerned with infectious and neoplastic diseases of the respiratory system contain little of merit. Perhaps the most remarkable thing in this book is the concluding paragraph of the section on respirallergy in which the author states that no criticism can be valid unless based on repetition of the work described.

[4]Practice of Psychiatry

WILLIAM S. SADLER, M. D., F.A.P.A., *Consulting Psychiatrist to Columbus Hospital and Pinel Sanitarium, Chicago. 1,183 pages. $15. St. Louis, C. V. Mosby, 1953.*

This text is divided into seven parts. In the author's terms, "It is the purpose of this book to serve as a ready and compact reference for diagnosis and immediate treatment."

One part, which deals with general psychiatric considerations, will probably cause much discussion of the author's classification, with particular reference to the pathoses, though there is much "common sense" in such a classification. These disorders are described as being "pre-neurotic." Here the author classifies cultists, pessimists, nonconformists, malingers, and so forth. He has found the classification serviceable in clinical practice. The part on "The Psychoses" contains easily readable discussions of the diagnosis and treatment of psychotic disorders, which alone make the volume of value to the general practitioner.

The discussion on general psychotherapeutics earns this text a sure place as a reference book. Most readers will enjoy the section on philosophy and religion. The general practitioner can and should assist many families and relatives by being able to discuss the various shock therapies and psychosurgery; these are well described.

The schools of psychiatry are discussed in the appendix. This reviewer enjoyed the approach to the "American School of Psychiatry." Dr. Sadler is a master at coining expressive phrases.

ORGANIZATION SECTION

TRANSACTIONS

EIGHTY-SEVENTH ANNUAL SESSION of the Texas Medical Association

SAN ANTONIO, TEXAS, MAY 2, 3, 4, AND 5, 1954

Sunday, May 2, 1954

MINUTES OF THE HOUSE OF DELEGATES

FIRST MEETING

(The House of Delegates of the Texas Medical Association convened at 9 a. m., Sunday, May 2, 1954, in the North Terrace of the Gunter Hotel, San Antonio.)

Dr. Hobart O. Deaton, Fort Worth, Speaker of the House: Will the House of Delegates please be in order. Does the Credentials Committee have a report? Dr. Raleigh Ross of the Credentials Committee reports that a quorum is present, so the House of Delegates will now be in order for the transaction of business.

MEMBERSHIP OF THE HOUSE OF DELEGATES

(The membership of the House of Delegates established by the Reference Committee on Credentials at this and subsequent meetings included 123 elected delegates and 45 ex-officio members with 7 of these 45 serving in two ex-officio positions. One ex-officio member also was an elected delegate, making the total 160 persons. The membership was as follows:)

Elected Delegates*

Anderson-Houston-Leon.—R. H. Bell.
Andrews-Ector-Midland.—William A. Wiesner.
Angelina.—L. H. Denman.
Armstrong-Donley-Childress-Collingsworth-Hall.—E. W. Jones.
Atascosa.—W. H. Joyce.
Bastrop-Lee.—James W. Thomas.
Baylor-Knox-Haskell.—E. H. Balch.
Bee-Live Oak-McMullen.—D. W. Davis.
Bell.—Robert A. Murray, J. C. Walker.
Bexar.—William H. Heck, J. Lewis Pipkin, John L. Matthews, J. J. Hinchey, W. W. Bondurant, Jr.
Bosque.—V. D. Goodall.
Bowie.—C. A. Smith.
Brazoria.—Ralph E. Gray.
Brazos-Robertson.—J. G. Sanders.
Brown-Comanche-Mills-San Saba.—S. Braswell Locker.
Cameron-Willacy.—H. L. Scales, Jr.
Cass-Marion.—William S. Terry.
Cherokee.—George M. Hilliard.
Clay-Montague-Wise.—J. T. Darwin.
Colorado-Fayette.—L. E. Ihle.
Comal.—William W. Sullivan.
Cooke.—James Atchison.
Coryell.—E. E. Lowrey.
Crane-Upton-Reagan.—B. J. Maynard.
Dallas.—Guy T. Denton, Jr., Ridings E. Lee, D. W. Carter, Jr., Jack G. Kerr, George M. Jones, Barton E. Park, Fred W. Horn, R. A. Trumbull, Arnott DeLange, Frank H. Kidd, Jr.
Denton.—Dickson K. Boyd.
DeWitt.—F. A. Prather.
Eastland-Callahan-Stephens-Shackelford-Throckmorton.—P. M. Kuykendall.
Ellis.—Herbert Donnell.
El Paso.—H. D. Garrett, C. C. Boehler.
Erath-Hood-Somervell.—T. F. Bryan.
Falls.—Roy B. Giles.
Galveston.—John Otto, W. T. Anderson.
Gray-Wheeler-Hansford-Hemphill-Lipscomb-Roberts-Ochiltree-Hutchinson-Carson.—Joe R. Donaldson.
Grayson.—Robert W. Duncan.
Gregg.—Frank V. Mondrik.
Grimes.—S. D. Coleman.
Guadalupe.—J. B. Williams.
Hale-Floyd-Briscoe-Swisher.—M. C. Schlecte.
Hardeman-Cottle-Foard-Motley.—A. C. Traweek, Sr.
Harris.—S. W. Thorn, Thomas J. Vanzant, T. P. Kennerly, B. P. York, Homer E. Prince, John H. Wootters, Alvis E. Greer, C. Forrest Jorns, George W. Waldron, H. L. Alexander, J. Stanley Oliver (W. H. Hamrick).
Harrison.—James H. Harris.
Hidalgo-Starr.—Marvin R. Lawler.
Hill.—Dick Cason.
Howard-Martin-Glasscock.—E. V. Swift.
Hunt-Rockwall-Rains-Delta.—S. D. Whitten.
Jefferson.—W. Pierre Robert, L. C. Carter, L. C. Powell.
Johnson.—Tolbert F. Yater.
Karnes-Wilson.—J. W. Oxford.
Kerr-Kendall-Gillespie-Bandera.—D. R. Knapp.
Kimble-Mason-Menard-McCulloch.—J. S. Anderson.
Lamar.—T. E. Hunt, Jr.
Lamb-Bailey-Hockley-Cochran.—G. V. Edgar.
Lampasas-Burnet-Llano.—R. L. Shepperd.
LaSalle-Frio-Dimmit.—B. E. Pickett, Sr.

EDITOR'S NOTE: *Throughout the Transactions parentheses indicate explanatory material not included in the verbatim report.*

**Names in parentheses in the list of delegates are of alternate delegates who served during part of the session.*

Lavaca.—C. T. Dufner.
Liberty-Chambers.—C. W. Castle.
Lubbock-Crosby.—William H. Gordon, A. G. Barsh.
McLennan.—Howard R. Dudgeon, Jr.
Medina-Uvalde-Maverick-Val Verde-Edwards-Real-Kinney-Terrell-Zavala.—J. D. Williamson.
Montgomery.—M. G. Hutchins.
Nacogdoches.—Stephen B. Tucker.
Nolan-Fisher-Mitchell.—Chester U. Callan.
Nueces.—C. P. Yeager, John F. Pilcher.
Palo Pinto-Parker-Young-Jack-Archer.—H. E. Griffin.
Pecos-Jeff Davis-Presidio-Brewster.—Charles E. Oswalt, Jr.
Potter.—A. E. Winsett, August J. Streit.
Reeves-Ward-Winkler-Loving-Culberson-Hudspeth.—C. A. Robinson.
Rusk.—Loyd Deason.
San Patricio-Aransas-Refugio.—Claude A. Selby.
Smith.—Madison J. Lee.
Tarrant.—Joseph F. McVeigh, Mal Rumph, J. D. Murphy, E. P. Hall, Jr., Holland T. Jackson (W. F. Armstrong, L. H. Reeves).
Taylor-Jones.—R. W. Varner.
Tom Green-Coke-Crockett-Concho-Irion-Sterling-Sutton-Schleicher.—Carl A. Kunath.
Travis.—Raleigh R. Ross, S. N. Key, Jr., B. M. Primer, Sr.
Van Zandt.—H. A. Baker.
Victoria-Calhoun-Goliad.—Joseph V. Hopkins.
Washington-Burleson.—G. V. Pazdral.
Webb-Zapata-Jim Hogg.—Albert C. King.
Wharton-Jackson-Matagorda-Fort Bend.—L. B. Johnson.
Wichita.—Robert L. Daily, E. Aubrey Cox.
Williamson.—Albert J. Rice.

Ex-Officio Members

President.—George Turner, El Paso.
President-Elect.—F. J. L. Blasingame, Wharton.
Vice-President.—Andrew S. Tomb, Victoria.
Secretary.—J. M. Travis, Jacksonville.
Speaker of the House of Delegates.—Hobart O. Deaton, Fort Worth.
Vice-Speaker of the House of Delegates.—Charles P. Hardwicke, Austin.
Board of Trustees.—Robert W. Kimbro, Cleburne, Chairman; Denton Kerr, Houston, Secretary; Sam N. Key, Austin; E. A. Rowley, Amarillo.
Board of Councilors.—R. G. Baker, Fort Worth, Chairman; J. T. Billups, Houston, Secretary; J. Leighton Green, El Paso; R. B. G. Cowper, Big Spring; Frank B. Malone, Lubbock; H. L. Locker, Brownwood; J. L. Cochran, San Antonio; Franklin W. Yeager, Corpus Christi; J. M. Coleman, Austin; James H. Wooten, Jr., Columbus; L. C. Heare, Port Arthur; C. E. Willingham, Tyler; J. Wilson David, Corsicana; Mayo Tenery, Waxahachie; H. O. Padgett, Marshall.
Council on Medical Jurisprudence.—J. B. Copeland, San Antonio, Chairman; James W. Rainer, Odessa; Robert D. Moreton, Fort Worth; John K. Glen, Houston.
Council on Medical Defense.—Charles L. McGehee, San Antonio, Chairman.
Council on Scientific Work.—May Owen, Fort Worth, Chairman.
Council on Medical Economics.—Harvey Renger, Hallettsville, Chairman.
Council on Medical Education and Hospitals.—Milford O. Rouse, Dallas, Chairman.
Committee on Public Relations.—Troy Shafer, Harlingen, Chairman.
Delegates to the American Medical Association.—T. C. Terrell, Fort Worth; Milford O. Rouse, Dallas; J. B. Copeland, San Antonio; A. C. Scott, Jr., Temple; John K. Glen, Houston.
Alternate Delegates to the American Medical Association.—J. C. Terrell, Stephenville; Troy Shafer, Harlingen, George Turner, El Paso; John L. Otto, Galveston; Robert W. Kimbro, Cleburne; L. C. Heare, Port Arthur.

Speaker Deaton: There are a few preliminaries that we wish to get out of the way. We have some student representatives from the Student AMA chapters. I have the name of only one so far, Mr. L. E. Chapman, Jr., from Galveston. Stand up and take a bow.

Those of you who are intending to present resolutions, if you will have six copies, it will facilitate matters and help to keep the records straight.

The first item in the order of business is the reading of the minutes of the previous meeting.

Dr. R. G. Baker, Fort Worth: Mr. Speaker, the minutes have been published, and I move the adoption of the minutes as published in the STATE JOURNAL OF MEDICINE in the June issue.

Dr. J. T. Billups, Houston: I second the motion. (Thereupon said motion being put to a vote, the same was duly carried.)

Speaker Deaton: Gentlemen of the House of Delegates, it gives me a great deal of pleasure to present the President of the Texas Medical Association, Dr. George Turner of El Paso.

ADDRESS OF PRESIDENT

Dr. Turner: I would like to make some remarks on the progress of the year 1953.

Our new headquarters office and Memorial Library building has now been open for more than a year, and I am sure that all of us feel we are getting our money's worth in the improvement that has resulted in the operation of Texas Medical Association activities. The difference in efficiency is accounted for by having adequate physical equipment with which to work and not being crowded into insufficient and poorly arranged space. Much better and more work is being accomplished easier because of facilities designed and built for the particular purpose needed. These working conditions coupled with the able direction of our Executive Secretary in coordinating and unifying the efforts of our central office personnel make the operation of our headquarters of the highest type. Recently an expert accountant has been added to the staff, which service, I am sure, will reflect itself in our financial management. In other words, we will know what is becoming of our dues money in a precise fashion. A visiting secretary from the central office will help materially to bridge the communications gap between this "information center," as it were, and the county medical societies. Your President and other officers work at this job, but this effort is not sufficient within itself. At least one traveling secretary, continuously on the road, will no doubt serve to cement better internal relations in our Association, and more than one might be better.

The Memorial Library has far extended its services and sphere of usefulness under the direction and unceasing efforts of our highly competent medical librarian. She has developed the Library practically from its beginning and is substantially responsible for all advancement and a highly commendable service. We can now say that the extensive facilities of our Library are becoming a practical working tool for more and more doctors across the state each day, and should again remind you that you can get all needed

reference material on any medical subject in which you may be interested with the simple use of one post card, and this will be sent to you by your Library. I like the term "your Library" because it belongs to the 6,400 doctors, more or less, who pay dues and are members of the Texas Medical Association. Our state membership picture this year is good: 270 new members have been added to the rolls and dues have been paid promptly at the state and AMA levels.

The Washington office of the AMA has been improved this year as our number one observation post concerning the progress of pending medical legislation. This office now maintains a most efficient, flexible, and complete set of files on every piece of medical legislation passing through the national Congress. Immediate information on the exact status, content, and possibilities of any pending medical legislation can be furnished instantly from this office.

Our Council on Medical Jurisprudence and our general counsel report that at the state level no legislation which would affect detrimentally the health care of the people of Texas has been enacted into law this year.

Our activities in the field of rural health have developed stronger relationships and better understanding with other groups concerned in the same problem. We have completed and learned much from an extensive survey of our own profession to determine actual facts on alleged "doctor shortage." We have been contacting lay officials and chambers of commerce of many communities to demonstrate our sincere desire to effect the most efficient doctor distribution possible. These efforts give promise of meeting with considerable success. We have been host this year to the National Rural Health Conference, recently completed in Dallas. At this conference, Texas doctors and our Texas program received much favorable comment.

Our Council on Medical Defense has prepared and distributed an excellent booklet dealing with the increasingly complicated legal aspects of medical practice.

We have begun a sound program to encourage more and more secretary training at the county society level. We have prepared an outline guide for secretary training and have augmented that with a detailed series of lectures. These are available to individual doctors or to societies that wish to encourage secretary training in night schools, business schools, or in the formation of local clubs for doctors' secretaries.

The meeting this year of county medical society presidents and secretaries is believed the most successful to date. The lines of communication between our Association headquarters and these local medical leaders is greatly strengthened.

It has long been felt that a closer liaison should be kept between our medical students—the doctors of tomorrow—and organized medicine. The Texas Medical Association made this project a reality this year in a "Medical Students' Day" program carried out in cooperation with the Dallas, Harris, and Galveston County Medical Societies. The speakers were officers of the Texas Medical Association who have had long experience in the practice of medicine and who deeply feel that these indocrination talks to students serve a useful purpose to them. The subject of medical organization was covered in detail at the county, district, state, national, and world levels. Other subjects covered were the salient aspects of internal and external public relations, the business side of medical practice, legal aspects of medicine, and professional and community responsibilities of doctors. Such subjects as the importance of membership and active participation in the affairs of organized medicine, the importance of having a clear understanding with the patient concerning the cost of medical or surgical service before it is performed, and the terms of payment for said services were emphasized. The talks were well received at each of the three medical schools and such remarks as ". . . these meetings held at the various medical schools in Texas comprise a very needed basic concept in the training of the doctors of the future" serve as encouraging stimuli for the continuance of this project.

Much time and thought have been given this year to the type and arrangement of our annual program, with a view of providing more for the greatest number and thereby increasing the attendance. You will be a better judge than I of our success in this respect, but I believe that our Council on Scientific Work has done a splendid job, and that this year's annual session will be one of the best. Our program this year is a departure from the usual section meetings; we have only two major groups, one pertaining to medicine and the other pertaining to surgery, and I am sure the larger attendance at the larger groups will be more stimulating to the speakers..

All boards, councils, and committees have functioned to a full measure of efficiency, and all accomplishments of the year stem from the untiring effort of each individual member. I wish to thank each member of the councils and committees and Board of Trustees and everyone who worked so diligently to make this year what it was and to make it a success. Our Board of Trustees has been tireless in its efforts for organized medicine. Our Board of Councilors has done much to develop stronger coordination throughout the councilor districts and serve as a policy-making body for Texas medicine. The grand total of the substantial progress in medicine accomplished during the year is due to the work and effort of all men and women who have served in the many projects of medical activity in your behalf.

Recommendations

In conclusion, I wish to make several recommendations for consideration by this House of Delegates. All of these recommendations concern some particular phase of medical practice. It does not necessarily mean they have to be included in the By-Laws or any definite rules made concerning any of these recommendations, but as a matter of policy to be followed in Texas medicine, I do wish to make these suggestions.

In several references to health insurance through the year, I stated that in my judgment, the minor costs of medical care such as an illness requiring only a few home visits by the doctor or a few visits to his office are no more than a part of the normal cost of living and should be optionally included in his health insurance protection. I, therefore, suggest that this House go on record as approving a $50 or more deductible clause in health insurance policies.

The utilization of television by county medical societies has come to rank along with the press in importance as a modality of presenting the picture of American medicine and furthering health education. I would like to recommend in this connection that a policy outlining regulations regarding physicians' appearances on TV be formulated for the guidance of county medical societies.

Our work in furnishing information for the guidance of student nurses and receptionists is proving of great value. I recommend that this effort be expanded to make this same type of information available for all medical associates and that a booklet be published containing a description of courses and mentioning accredited schools where such courses are given. I refer to pharmacists, medical technologists, physical therapists, x-ray technicians, mental health associates, ophthalmic associates, dieticians, occupational therapists, medical artists, dental associates, public health associates, public health educators, health inspectors, hos-

pital administrators, medical social workers, medical secretaries, medical librarians, vital statisticians, and industrial and skin hygienists. The purpose of that is to have information available so prospective students can have information available and be trained in the proper way, believing that the work of these associates is most valuable and the training of them is necessary for our best health.

We not infrequently hear the statement that hospitals are actively engaged in the practice of medicine and that there is apt to be more and more medicine practiced by corporative institutions. An expression of policy by the Medical Association on this important question of infringement on the practice of medicine by hospitals seems timely.

Our state and county public health units and activities have long had the support of organized medicine, but in recent years our attitude has become more of a disinterested toleration than of active support. Reaffirmation of our support and sincere effort to assist in seeing that public health coverage is extended to every area of the state lacking it is a gesture worthy of our consideration at this time.

Our Medical Students' Day program was well received and many requests have been made to make the project a permanent yearly activity. I suggest that this policy be established.

In view of the obvious success and value to the Association of our county medical society presidents and secretaries meeting, I recommend that this meeting be made a permanent adjunct to our January Executive Council meeting each year.

Because of important matters coming before our councils and committees that should not lay over for a full year or even until the next Executive Council meeting, I recommend that the last meeting of the House of Delegates be left on the last day of a convention.

Speaker Deaton: Thank you, Dr. Turner. The address of the President will be referred to the Reference Committee on Report of Officers and Committees, except that portion dealing with health insurance and the policy on TV, which will be referred to the Reference Committee on Medical Service and Public Relations. The recommendation as to the last meeting on the last day will be referred to the Reference Committee on Amendments to the Constitution and By-Laws.

Someone has suggested that the reference committees be announced and I might give you that briefly:

REFERENCE COMMITTEES

Reference Committee on Credentials.—Raleigh R. Ross, Austin, Chairman; J. C. Walker, Temple; J. R. Donaldson, Pampa; R. W. Duncan, Denison; John H. Wootters, Houston; James D. Murphy, Fort Worth.

Reference Committee on Reports of Officers and Committees.—E. P. Hall, Jr., Fort Worth, Chairman; John F. Pilcher, Corpus Christi, Vice-Chairman; R. H. Bell, Palestine; R. W. Varner, Abilene; Thomas J. Vanzant, Houston; A. G. Barsh, Lubbock; D. K. Boyd, Denton.

Reference Committee on Resolutions and Memorials.—S. D. Coleman, Navasota, Chairman; S. Braswell Locker, Brownwood, Vice-Chairman; Howard Dudgeon, Jr., Waco; C. P. Yeager, Corpus Christi; Guy T. Denton, Jr., Dallas; H. E. Griffin, Graham; Charles E. Oswalt, Jr., Fort Stockton.

Reference Committee on Finance.—E. W. Jones, Wellington, Chairman; Stephen B. Tucker, Nacogdoches, Vice-Chairman; H. A. Baker, Wills Point; G. V. Pazdral, Somerville; J. C. Terrell, Stephenville; C. A. Robinson, Kermit; Byron P. York, Houston.

Reference Committee on Amendments to the Constitution and By-Laws.—Jack G. Kerr, Dallas, Chairman; J. J. Hinchey, San Antonio, Vice-Chairman; Chester U. Callan, Rotan; J. B. Williams, Seguin; E. V. Swift, Big Spring; R. L. Daily, Wichita Falls; Charles Adna Smith, Texarkana.

Reference Committee on Scientific Work.—A. C. Scott, Jr., Temple, Chairman; C. Forrest Jorns, Houston, Vice-Chairman; John L. Otto, Galveston; G. V. Edgar, Levelland; C. C. Boehler, El Paso; Dick Cason, Hillsboro.

Reference Committee on Medical Service and Public Relations.—Van D. Goodall, Clifton, Chairman; Ridings E. Lee, Dallas, Vice-Chairman; W. W. Bondurant, Jr., San Antonio; Ralph E. Gray, Lake Jackson; Joseph F. McVeigh, Fort Worth; Dwight R. Knapp, Kerrville; H. D. Garrett, El Paso.

Speaker Deaton: The various work that comes before the House of Delegates will be referred to these committees. The times and places of their meetings will be announced; if you wish to appear before any of those committees, you are certainly privileged and urged to do so. I will turn the microphone back to Dr. Turner, for some further announcements that he wishes to make.

Dr. George Turner, El Paso: Some three weeks ago in Salina, Kan., Dr. Leo J. Schaefer, who was presenting a paper before his county medical society, suffered a heart attack and was carried to the hospital, where he still is. The way that affects us, Mrs. Schaefer is President of the Woman's Auxiliary to the American Medical Association. Since Dr. Schaefer's illness, the President-Elect of the Woman's Auxiliary to the American Medical Association has been filling appointments for Mrs. Schaefer. This person is Mrs. George Turner, who is here for Mrs. Schaefer and will make a few remarks to you at this time.

GREETINGS FROM WOMAN'S AUXILIARY TO AMA

Mrs. George Turner, El Paso: It is a great privilege to be here this morning, and as you have been told, I am a substitute for the President of our Auxiliary at this meeting. I am pleased to bring you greetings from our 65,350 members who belong to 1,130 county auxiliaries in the 48 states, the territories of Hawaii and Alaska, and the District of Columbia.

We know that health is a primary consideration of people. Our programs for the Auxiliary meetings are planned to inform our members of the problems of the Medical Association and the ways in which the doctors are attempting to solve and in many instances are solving them. Therefore, as Auxiliary members, we have a twofold service to render: educating ourselves and bringing proper information to our home communities through the organizations in which we hold membership.

Not too many years ago the life of a doctor's wife was rather calm and placid. Today she must be informed concerning problems which affect health or else offer no comment in the discussions to which she must listen in any group in which she may find herself.

We need your help. It was recently announced that there are now 146,723 members of the American Medical Association while our own membership is only 65,350. Our ultimate goal is to match your membership. We want every eligible doctor's wife as a member. We are working this year toward a 10 per cent increase in our membership.

Outstanding is our work in nurse recruitment, which we further in various ways, by scholarships, by loan funds, and by establishing or sponsoring future nurses' clubs in high schools.

Another thing of which we are very proud is our contribution to the American Medical Education Foundation.

For three years the National Auxiliary has donated $10,000 from what we call our accrued balance. Of course, that is coming to an end because our money does not accrue that fast. However, that is being supplemented now by donations from the state and county auxiliaries. Last year $22,630 was contributed and we feel sure that through June of 1954 this amount will be doubled. Of course, our only source of income is from our $1 per member annual dues. With a membership more closely approximating your membership, we could increase our potential value in our philanthropies. We do prefer to increase our membership rather than to increase our dues.

Today's Health magazine, published by the American Medical Association, is an excellent medium for disseminating authentic health information. People eagerly read medical articles in other magazines, so why should we not make authentic information available to them? We sell subscriptions to *Today's Health,* and our goal this year is 64,000 subscriptions, one for each member, which will about double the subscription list of last year. Here again, we need your help. Only 15 per cent of the doctors subscribe to *Today's Health.* We know you do not want to read it or do not need to read it, but your patients do need to read it, so won't you please make it available to them in your reception rooms? Then I might add that the county auxiliary gets $1.50 for selling these subscriptions, so the local organization gets something out of it.

We keep ourselves informed on medical legislation, mental health problems, and voluntary health insurance. We help however we may to promote community health forums, local community health days, and rural health programs. We assist with the civil defense program at the local level. We participate in other health organization projects such as cancer, polio and so forth, on both the community, state, and national levels. Many of our members hold responsible offices in these organizations.

In 1954-1955, we are asked to put special emphasis on assisting the county medical societies with health forums and to join actively and work with the county and state mental health societies, and further to work with the safety program and the juvenile delinquency program in our respective communities. We believe that saving healthy lives is perhaps more important than saving diseased lives.

Each November a conference of state presidents and presidents-elect and National Auxiliary committee chairmen is held in Chicago, with representatives from our 51 state and territorial auxiliaries attending. Here are exchanged ideas and ideals, and valuable assistance and inspiration are given by speakers from the American Medical Association and other speakers of note. Each member attending this conference goes home more enlightened and more eager to assist her state and county medical societies in any work which they may assign.

The achievements of American medicine are unparalleled, and we, your wives, are justifiably proud of you, our husbands. However, we must realize that the appreciation of the public is not based on excellent medical care alone, but is in ratio to our devotion to the welfare of the community through community health education and community health service. Through the daily relationship between doctor and patient and the doctor's wife and her contacts, confidence in our ability and sincerity as leaders in community health is established.

I know that a good speech must have a good beginning and a good ending, both of which are kept close together. In closing, may I quote an old proverb: "He who would leave footprints on the sands of time must wear work shoes." May I add that the Auxiliary does wear work shoes.

Dr. George Turner, El Paso: Now we have the very charming President of the Woman's Auxiliary to the Southern Medical Association, whom I am happy to present at this time, Mrs. George D. Feldner from New Orleans. (Greetings were extended by Mrs. Feldner.)

Dr. Turner: Next to the total affairs of the Texas Medical Association is my deep interest in the State Health Department. As I have said before, through the years and in the present, we should see to it that the public health service is extended to every part of the state which is now not getting it and which does lack it. We have a state health officer who, I am sure, will most ably direct the activities of that great department and give Texas the type of health service and coverage to which the tax payers are entitled. It gives me great pleasure to introduce to you Dr. Henry A. Holle, state health officer of Texas (introducing Dr. Holle). Thank you, Mr. Speaker.

Election of General Practitioner of Year

Speaker Deaton: The next item of business is the election of General Practitioner of the Year. Do we have some nominations for General Practitioner of the Year?

Dr. R. G. Baker, Fort Worth: Some of you may be new in the House of Delegates. This particular item is processed in this way: these nominations are submitted and they are referred to the Board of Councilors; the Board of Councilors selects from the names submitted two, which are then submitted to the House of Delegates for action.

The Board of Councilors considered four proposed members for the award of General Practitioner of the Year, and herewith nominates Dr. Thomas P. Ware of Poteet and Dr. A. L. Thomas of Ennis as candidates for this award.

Dr. Thomas P. Ware

Dr. J. J. Hinchey, San Antonio: Dr. W. B. Russ of San Antonio, past president of the Texas Medical Association, addressed the Poteet Strawberry Festival in 1953 with these words: "The Golden Rule represents the wisdom of the ages and all religions. This man represents the Golden Rule." This statement was made in an address to those who had gathered to honor their doctor on the completion of his fiftieth year of practice.

Thomas Ware was born near D'lo, Miss., August 6, 1881, the youngest of five children of Thomas and Tabitha Dye Ware. The parents were pioneers in the deepest sense of the word, for they had come to Mississippi in ox wagons in 1855 to wrest a living from the soil and to rear their children. This same spirit was instilled into their sons and daughters to the extent that the youngest was to pioneer as a "country doctor" in a new and unfamiliar environment.

Tom Ware attended the common schools of Mississippi, and at the age of 17 was granted a first grade teacher's license. To finance his childhood dream of becoming a doctor, he taught in the common schools for one term. Entry into medical school was delayed by typhoid fever in 1899, but in the fall of 1900, he entered Memphis Hospital Medical College. He was awarded the degree of doctor of medicine on April 30, 1903. Memphis Hospital Medical College was later to become the official medical school of the University of Tennessee.

The young Dr. Ware set up his first practice in New Hebron, Miss. One of his first professional calls was into the country home of Will Hutchins. There he met Myra Hutchins, and on October 19, 1904, she became his wife. They reared four children: Mrs. Lee Ricks, Sr., wife of a Pleasanton merchant; Mrs. J. B. Copeland, wife of a San Antonio doctor; Mrs. E. O. Threlkeld, wife of a Seguin

attorney; and T. P. Ware, Jr., petroleum engineer in Corpus Christi.

After eight years of practice in New Hebron, Dr. Ware moved to South Texas, and on November 11, 1911, he opened his first Texas office in Dilley.

According to Dr. Ware, medical practice in South Texas, at that time, was more difficult than practice had been in Mississippi. Mississippi roads were far superior, in those days, to the cattle trails of Texas; so he had to give up the horse and buggy that he had used for transportation in favor of a horse and saddle. His saddlebags replaced the Mississippi drug store, and from them he compounded medicines with which to treat his patients.

In 1913, Dr. Ware moved to Lytle and became associated with Dr. R. B. Touchstone, a former classmate. In 1917, the disastrous flu epidemic struck the nation, and after many long days and nights of faithful service, Dr. Ware himself became a victim of the disease. The damage wrought by the flu and overwork led to a general debility, then pellagra, and forced him to sell his practice to Dr. W. M. Gipson in 1920.

In 1921, he set up practice in Floresville, and after one year moved to Kyle, where he remained until 1924. Dr. Gipson in Lytle became ill, and being unable to care for the entire practice, prevailed upon Dr. Ware to return to the area. This he did, and began practice in Somerset. Shortly thereafter, Dr. Gipson died, leaving the entire area of Somerset, Lytle, Poteet, Jourdanton, Rossville, Leming, Pleasanton, and Charlotte to be cared for by Dr. Ware and Dr. C. C. Shotts, Sr., of Poteet.

In 1937, Dr. Shotts died, leaving the Poteet Hospital without a doctor. Since the center of population was in Poteet, Dr. Ware moved his office to the hospital so that he could care more adequately for the large practice area.

He has served as county health officer for Atascosa County at various times and on so many occasions that he doesn't "rightly remember" which years they were. He knows that for ten years he served as president of the Atascosa County Medical Society, and one year served as its representative to the House of Delegates of the State Medical Association. He has been a member of the Texas Medical Association since he began practicing in Texas and in 1954 refused to be made an honorary member of that Association, preferring to remain an active member. He is also a member of the Academy of General Practice in Texas.

During World War II, his office made all Selective Service examinations for Atascosa County. At times, the load became so heavy that a colleague from Lytle was called on to help. Dr. Ware holds a presidential citation for his services during that time.

He has served as local surgeon for the Missouri-Pacific Railroad since 1914. He has made thousands of examinations for life insurance and oil companies. For thirty years Dr. Ware served as team doctor for the football squads of the towns where he has lived, and he has never made a charge for these services.

In Clear Creek, Miss., on his twenty-first birthday, Dr. Ware made application to become a Mason. On September 6, 1902, he took his first degree; the second degree in October, 1902; and the master's degree in January, 1903. He has been affiliated with the Royal Arch, Knights Templar, and the Shrine. When he received his 50 year pin in Masonry, he was believed to be the youngest 50 year Mason in Texas. The Somerset Masonic Lodge presented him with a life membership in 1953.

A member of the Baptist Church since childhood, Dr. Ware has actively participated in church functions since that time. He has long advocated the furthering of the social position and living conditions of the Latin-American people and in 1949 was most instrumental in the formation and building of the Baptist Spanish-American Mission in Poteet.

Dr. Ware served as a member of the Poteet School Board and has been a member of the Rotary Club and other service organizations in the cities in which he has lived. He has refused to accept officer appointments in any of these organizations, feeling that his medical practice comes first.

Dr. Ware's influence in Poteet community life is graphically illustrated by his efforts, several years ago, to raise the final funds necessary to build a new community hall and fire station. The civic leaders were stalled until "Doc" was persuaded to take over at a mass meeting. It took him about ten minutes to raise the $1,500 additional that was needed.

In 1906 Dr. Ware took a postgraduate course in general medicine at the College of Physicians and Surgeons in Chicago, and in 1918 he did further postgraduate work at Tulane University.

In May, 1947, Dr. Ware, tired by his near single-handed efforts to give this section of South Texas medical service during World War II, announced that he would take a rest. (It was briefer than he had anticipated.)

However, this announcement moved the Pleasanton *Express* to comment in its June 5, 1947, edition: "During the last world war, when practically every doctor in the county was called to military duty, Dr. Ware took over their duties and was on call night and day all over the county and also operated the Shotts Memorial Hospital. The clock never pointed to the end of his day's work. How he managed to keep on going and going to answer the call of the sick and injured, no one will ever know. We only know that when we called, he came and administered. . . .

"The love and respect held by thousands and thousands of Atascosans for this fine citizen truly is immeasurable. Evidence of this fact was demonstrated when many, many of his patients, upon being told he was retiring from practice for awhile, broke down and wept like children; for they trusted in him beyond measure and loved him as much."

It is the opinion of many persons that Dr. Ware's unselfish work during World War II, with supreme disregard for his own health and well-being, reflects great credit not only upon himself, but the medical profession as well. It is a matter of record that during the war, he once delivered five babies in one twelve hour period at widely scattered locations in the county.

On September 28, 1953, along with the remaining living graduates of the class of 1903 of the University of Tennessee, he was presented with a Golden "T" certificate at special commencement exercises which honored those graduates who have practiced for fifty years.

Probably the greatest day of Dr. Ware's medical life occurred April 30, 1953, when the people of Atascosa County paid tribute to their doctor on "Doc Ware Day." A parade of "Doc's babies" marched behind him through the streets of Poteet. The army of "babies," trailing in formation behind the doctor's car, was somehow reminiscent of the Pied Piper. Their ages ranged from 2 months to 39 years. More than 500 registered, but many more marched. Doc estimates that he has made more than 5,000 home deliveries since beginning practice.

Later, he heard himself eulogized by Dr. W. B. Russ of San Antonio, who praised the "country doctor" in general, and Dr. Ware in particular, saying, "The Golden Rule represents the wisdom of the ages and all religions. This man you're honoring today represents the Golden Rule."

Said the Pleasanton *Express* editorially, in writing on the

celebration: "It is doubtful if any man in South Texas ever received a more spontaneous demonstration of affection and respect than was accorded Dr. Thomas Preston Ware at Poteet last Saturday. . . . Regardless of their circumstances, their fame, their discoveries, no doctor could be richer than Doc Ware. He's given a lifetime of service to people who appreciate his efforts."

After the celebration, Dr. Ware asserted, "After all this, about all I can do now is either quit or die." But thousands of South Texans would protest his doing either.

Dr. A. L. Thomas

Dr. Mayo Tenery, Waxahachie: For many years the cities of Waxahachie and Ennis have been great rivals, but this is one time when a Waxahachian feels it is a great honor to say something in behalf of a citizen of Ennis.

Dr. A. L. Thomas is 78 years of age. He was born in Augusta, Ga., and came to Texas at the age of 11. He taught school for awhile and then went to medical school in Louisville, Ky. After that he came back to Ellis County and began the practice of medicine in 1903. Except for one year when he stopped for an internship, he has been continuously in general practice in Ellis County since that time.

Last year the citizens of Ellis County likewise held a reception in honor of Dr. Thomas for his fifty years in service to the people of Ellis County, and hundreds attended. He is very close to the hearts of his people and he is still in active practice. In fact, he can do more work in one day than I possibly can, and he plans to continue to do so.

Dr. Thomas was the first in Ellis County to have a microscope and did the microscopic work for doctors all over the county for several years. He was the first one in Ellis County to have an x-ray machine. He started out, of course, like many of you, in the horse and buggy days and did his first operation on the kitchen table out in the country.

Not only is Dr. Thomas a great physician, a surgeon and obstetrician, and family counsellor, but he is also a citizen of Ellis County. He has been health officer for the city of Ennis for many, many years. He was chairman of the first library board in the founding of a library for Ennis. He is chairman of the trustees of Ennis High School and has been for several years. Any of you who know the work of the school board, know how much time that takes. He has been president of the Kiwanis Club. In 1951 the Lions Club, when inaugurating the idea of the first citizen of the year, picked Dr. Thomas as the first one it would claim as the citizen of Ennis. He is now chairman of the committee to revise the charter of the city of Ennis.

Dr. Thomas is a devoted Christian. He is a member of the Methodist Church, a member of the board of stewards and chairman a number of times. He is at this time chairman of the building committee for the new church. He has been teacher of the men's Bible class for many, many years. He is the lay delegate from his Methodist Church to various congresses.

He has been a member of the Texas Medical Association continuously since 1908, a total of forty-seven years of continuous service in organized medicine. He has been president of the Ellis County Medical Society many times and president of the doctors' weekly luncheon club in Ennis, and he is constantly working for organized medicine.

Dr. Thomas is still very interested in the education of young people and many, many young people go to him for advice and help. Many such young people are carrying on their education with his help, financially and otherwise, of which he says nothing—just goes ahead about his daily routine of carrying on the practice of medicine as he has done now for fifty-one years.

Speaker Deaton: Are there any other speakers in behalf of these candidates?

Dr. J. Wilson David, Corsicana: I want to second the nomination of Dr. Thomas of Ennis. I know Dr. Thomas as he lives only about 25 miles from me and have known him for many years not only personally but by reputation. It would be futile for me to try to repeat the many things that Dr. Thomas has done as outlined by Dr. Tenery. I do want to say, however, that I know Dr. Thomas fulfills all the requirements of what we expect of a general practitioner.

Dr. H. E. Griffin, Graham: July 15, 1907, I started the practice of medicine in Ennis. Across the hall from me was Dr. Thomas' office. I remained in that town six or seven years and moved out into the west. There is no man in Texas who deserves this honor better than Dr. Thomas.

Speaker Deaton: Gentlemen, are you ready to take a vote? I will ask the tellers to collect the ballots and Dr. Jack Kerr of Dallas will act as chairman of the canvassing committee.

(The tellers subsequently reported 117 voting, with Dr. Ware receiving 47 votes and Dr. Thomas receiving 70. Dr. Thomas was declared General Practitioner of the Year.)

Speaker Deaton: The next business at hand is the report of the Executive Secretary, Mr. Forrester.

(Mr. N. C. Forrester, Austin, then presented a published report and supplementary report as follows:)

REPORT OF EXECUTIVE SECRETARY

The volume of work at the central office continues to increase with the growth of the Association. With the exception of the actual printing of the JOURNAL, all of the material is processed in the headquarters building. New machines have been installed in the business office to facilitate the handling of membership records and bookkeeping procedures.

The number of doctors requesting material and information from the Memorial Library has almost tripled, and the volume of the material requested has increased four-fold. The Physicians Placement Service continues to assist many doctors to find suitable locations and communities in their efforts to make medical care available.

Changes have been made in the physical appearance and format of the TEXAS STATE JOURNAL OF MEDICINE. We believe it to be one of the outstanding journals now published by a state medical association.

The activity of the State Advisory Committee to the Selective Service System has decreased since the cease fire order, but Public Law 84 (83rd Congress) is still in effect.

The addition (April 1, 1954) of Mr. C. Lincoln Williston to work directly with the Councilors and county medical societies should prove beneficial to the progress of organized medicine in our state.

With the addition of modern equipment and simplified procedures we have been able to reduce the central office staff by two full time employees. We deeply appreciate the advice and cooperation of the members of the Association.

Changes in Official Family

The following changes in the official family of the Texas Medical Association have occurred since the last meeting:

Vice-Councilors appointed were Dr. Howard Smith, Marlin, Twelfth District, and Dr. L. J. Webster, Abilene, Thirteenth District.

Dr. A. B. Cooper, El Paso, was appointed to the Committee on Mental Health.

Dr. Hugh Welsh, Houston, was appointed chairman of the Committee on Public Health to replace Dr. John F. Pilcher of Corpus Christi who resigned as chairman but remained a member of the Committee.

Dr. George D. Bruce, Baytown, was appointed to serve on the Committee on Rural Health.

Three new special committees were appointed as follows:

Committee for Coordination of Insurance Claims—Dr. M. C. Overton, Jr., Pampa, chairman; Dr. Tom B. Bond, Fort Worth; Dr. John H. Wootters, Houston; Dr. James W. Rainer, Odessa; and Dr. J. B. Copeland, San Antonio.

Committee for Liaison with Workmen's Compensation Insurance Companies—Dr. Sam N. Key, Jr., Austin, chairman; Dr. Frederick C. Rehfeldt, Fort Worth; Dr. R. G. Carpenter, Dallas; Dr. M. H. Morris, San Antonio; and Dr. Wendell H. Hamrick, Houston.

Committee to Study Infringements on Private Practice of Medicine—Dr. T. C. Terrell, Fort Worth, chairman; Dr. Laried S. Oates, Center; Dr. C. F. Crain, Corpus Christi; Dr. Neil D. Buie, Marlin; Dr. Robert A. Johnston, Houston; and Dr. Joe Nichols, Atlanta.

Appointed on the Advisory Board to the Texas Society of Medical Technologists was Dr. M. S. Hart, El Paso.

To the Texas Joint Commission for the Improvement of the Care of the Patient were appointed Dr. A. C. Scott, Jr., Temple; Dr. Truman G. Blocker, Jr., Galveston; Dr. G. E. Brereton, Dallas; and Dr. Joseph F. McVeigh, Fort Worth.

Respectfully submitted,
N. C. FORRESTER.

SUPPLEMENTARY REPORT OF EXECUTIVE SECRETARY

Honorary, Inactive, and Emeritus Membership

The list of nominations of the various county medical societies for honorary, inactive, and emeritus memberships has been printed, and a copy is available on the desk where you register as you come into this hall. That will eliminate reading this entire list each time. (The list of nominees follows:)

HONORARY MEMBERSHIP

District 1:

El Paso County Medical Society—

Dr. James W. Laws, El Paso; born 1873; member 1918-1954, 37 years.

Dr. Will P. Rogers, El Paso; born 1875; member 1906-1954, 49 years.

Dr. B. F. Stevens, El Paso; born 1874; member 1904-1954, 51 years.

Dr. James Vance, El Paso; born 1875; member 1906-1954, 49 years.

District 2:

None reported.

District 3:

Armstrong-Donley-Childress-Collingsworth-Hall Counties Medical Society—

Dr. Perry R. Jeter, Childress; no date of birth recorded; member 1929-1954, 26 years.

Lubbock-Crosby Counties Medical Society—

Dr. W. E. Payne, Slaton; born 1887; member 1915; 1917; 1920-1924; 1930-1954, 32 years.

Dr. A. C. Surman, Post; born 1887; member 1915-1917; 1923-1929; 1931-1932; 1935-1954, 32 years.

Dr. D. C. Williams, Post; born 1885; member 1915-1917; 1924; 1927-1928; 1930; 1934-1935; 1937-1954, 27 years.

Potter County Medical Society—

Dr. Robert P. Gallagher, Amarillo; born 1914; member 1953-1954, 2 years.

District 4:

Kimble-Mason-Menard-McCulloch Counties Medical Society—

Dr. John Gordon McCall, Brady; born 1876; member 1906-1954, 49 years.

District 5:

Atascosa County Medical Society—

Dr. Jeremiah Ward, Jr., Poteet; born 1879; member 1915-1918; 1944-1952; 1954, 14 years.

Bexar County Medical Society—

Dr. John B. Herff, San Antonio; born 1878; member 1904-1912; 1914; 1916-1954, 49 years.

District 6:

Cameron-Willacy Counties Medical Society—

Dr. Clarence M. Cash, San Benito; born 1864; member 1905-1954, 50 years.

Hidalgo-Starr Counties Medical Society—

Dr. Thomas W. Glass, Weslaco; born 1888; member 1923; 1929-1954, 26 years.

Dr. L. J. Montague, Edinburg; born 1894; member 1927-1928; 1930-1934; 1936-1954, 26 years.

District 7:

Travis County Medical Society—

Dr. Sam N. Key, Sr., Austin; born 1886; member 1912; 1914-1954, 42 years.

Williamson County Medical Society—

Dr. Edmond Doak, Taylor; born 1878; member 1906-1932; 1935-1950; 1952-1954, 46 years.

District 8:

None reported.

District 9:

None reported.

District 10:

Angelina County Medical Society—

Dr. L. T. Tinkle, Lufkin; born 1893; member 1919-1951; 1954, 34 years.

Jefferson County Medical Society—

Dr. D. A. Mann, Beaumont; born 1876; member 1909; 1913-1916; 1918-1954, 42 years.

Dr. J. D. Martin, Beaumont; born 1883; member 1924-1941; 1943-1954, 30 years.

District 11:

None reported.

District 12:

None reported.

District 13:

Tarrant County Medical Society—

Dr. Bertha S. McDavitt, Fort Worth; born 1877; member 1915-1954, 40 years.

Wichita County Medical Society—

Dr. Fred R. Landon, Wichita Falls; born 1902; member 1933-1954, 21 years.

Dr. Tim H. Parmley, Electra; born 1883; member 1915-1954, 40 years.

District 14:

Cooke County Medical Society—

Dr. Silas M. Yarbrough, Gainesville; born 1898; member 1926-1954, 28 years.

Dallas County Medical Society—

Dr. Guy B. Fain, DeSoto; born 1873; member 1922-1937; 1939; 1941-1952; 1954, 30 years.

Dr. W. W. Fowler, Dallas; born 1871; member 1905-1906; 1908-1954, 49 years.

Dr. Edward G. Lyon, Dallas; born 1884; member 1930; 1939-1954, 16 years.

Dr. James Madison Potts, Dallas; born 1873; member 1920-1954, 35 years.
Dr. Price M. Walker, Houston; born 1896; member 1923-1954, 32 years.
Denton County Medical Society—
Dr. Joseph H. Allen, Justin; born 1877; member 1904-1952; 1954, 50 years.
Ellis County Medical Society—
Dr. J. H. Curby, Maypearl; born 1878; member 1908; 1911; 1914; 1927-1929; 1931-1954, 30 years.
Dr. E. F. Gough, Waxahachie; born 1878; member 1908-1954, 47 years.
Dr. A. L. Thomas, Ennis; born 1875; member 1908-1954, 47 years.
Hunt-Rockwall-Rains-Delta Counties Medical Society—
Dr. Samuel D. Whitten, Greenville; born 1883; member 1915-1916; 1918-1954, 38 years.
Kaufman County Medical Society—
Dr. Percy C. Shands, Mesquite; born 1878; member 1904; 1906-1954, 50 years.
District 15:
Gregg County Medical Society—
Dr. Henry H. Niehuss, Longview; born 1876; member 1933-1952; 1954, 21 years.

Inactive Membership

District 1:
None reported.
District 2:
None reported.
District 3:
None reported.
District 4:
None reported.
District 5:
Bexar County Medical Society—
Dr. R. E. Bowen, Sr., San Antonio; born 1879; member 1908-1910; 1915; 1918-1954, 41 years.
Dr. A. O. Hull, San Antonio; born 1891; member 1917-1929; 1936-1937; 1949-1954, 20 years.
Dr. Thad Shaw, New York, N. Y.; born 1884; member 1919-1954, 35 years.
District 6:
None reported.
District 7:
None reported.
District 8:
Lavaca County Medical Society—
Dr. J. W. Boyle, Jr., Temple; born 1888; member 1920-1954, 35 years.
District 9:
None reported.
District 10:
Jefferson County Medical Society—
Dr. C. W. Fulbright, Altheimer, Ark.; born 1895; member 1925-1954, 30 years.
District 11:
None reported.
District 12:
None reported.
District 13:
None reported.
District 14:
Denton County Medical Society—
Dr. Bobby Jewell Short, Denton; born 1917; member 1946-1951; 1954, 7 years.
District 15:
None reported.

Emeritus Membership

District 14:
Dallas County Medical Society—
Dr. Oscar M. Marchman, Sr., Dallas; born 1872; member 1906-1954, 49 years.

Membership

As of today, the membership of the Texas Medical Association is as follows: regular, 5,824; intern, 184; honorary, 231; inactive, 14; military, 193; emeritus, 8; a total of 6,454, an increase of exactly 300 over this date last year. The final paid membership for 1953 was 6,721 and in that, of course, we include the honorary and inactive. It is our belief that the membership this year will exceed 7,000. The AMA membership as of this date is 5,332.

We would like to call your attention to one thing: many of you have not as yet received the new membership directory of the Texas Medical Association for 1953. This is being mailed without cost to each member whose name is in this book. The directories are being mailed alphabetically, but be patient for a few days and you will receive your copy.

Appreciation

I should like to express the appreciation of the entire staff of the Texas Medical Association and myself for the wonderful cooperation of you doctors. We realize and know that we are employees. We have nothing whatsoever to do with determining the policies of the Texas Medical Association. That is your job. But we do want to do a good job for you and we can only do that when you help us and give us constructive criticism. If something is wrong, you tell us and we will do our best to correct those errors. It is a pleasure to make this report to you and to assure you that it is our sincere desire to serve you to the best of our ability.

Respectfully submitted,
N. C. Forrester.

Speaker Deaton: The report of the Executive Secretary and the supplementary report will be referred to the Reference Committee on Reports of Officers and Committees, except that the nominations for honorary, inactive, and emeritus membership will be referred to the Board of Councilors.

The next item of business is the report of the Treasurer, Dr. Herbert Thomason of Fort Worth. I understand that Dr. Thomason is on his way to Europe to attend a meeting of the College of Surgeons. The report will be found printed, and this report also will be referred to the Reference Committee on Finance.

(The report follows:)

REPORT OF TREASURER

The facts and figures pertaining to the accounts of the Treasurer of the Texas Medical Association are reflected in the auditor's report, which will be submitted by the Board of Trustees, and to which I refer.

There is cash on hand and in the bank as of December 31, 1953, as follows:

Austin National Bank—Regular	$38,739.49
Austin National Bank—Payroll	3,859.50
American National Bank	4,809.08
Petty Cash	80.00
Total	$47,488.07

The total cash received from all sources during the calendar year, 1953, amounted to $365,541.42, and the total cash disbursed for the same period totaled $373,434.84.

Texas Memorial Medical Library Association

As Treasurer of this Association, I report the following investments of said Association as of December 31, 1953:

Respectfully submitted,
T. H. THOMASON, Treasurer.

We certify the above to be correct as disclosed by audits.
HOWARD T. COX & COMPANY
By Fred J. Sublette,
Certified Public Accountant.

Speaker Deaton: The next item of business is the report of the Board of Trustees, Dr. R. W. Kimbro of Cleburne, chairman.

Dr. Kimbro: Before presenting our report I would like to call to your attention two facts which are in the report. I want to make known to you Mr. E. Maxwell Jones, who is a certified public accountant and is serving as business manager of the Association. Mr. Jones is the man you saw at the registration desk. I would like all of you to know him because he is doing a splendid job.

The next new addition to the staff is Mr. Lincoln Williston. His title is assistant executive secretary, and he is the gentleman referred to as our traveling field man. Mr. Williston came to us from Chicago, where he was the manager of public relations for the University of Illinois Medical Center. His education was received in the University of Illinois, and he received the Sigma Delta Chi award as the most outstanding graduate of the university's school of journalism in 1942. He has had newspaper experience, served as a captain in the Air Force for four years, and has been chairman of the Medical Schools Section, American College Public Relations Association. I think you will find Mr. Williston most capable, and I hope you will meet him while you are here.

(Dr. Kimbro then presented the following reports:)

REPORT OF BOARD OF TRUSTEES

The Board of Trustees, since the completion of the new home, has concerned itself not only with a continuation of services that have been rendered, but also with expansion and addition of new services. The loan against the building has been reduced substantially, and the financial status of the Association is satisfactory. The membership of the Association has grown steadily for the past six years, and the actual membership for 1953 approached the 7,000 mark.

The Board, in cooperation with the Board of Councilors, is in full accord with the constitutional amendment whereby dues for honorary, inactive, and military members will be completely eliminated. It is the Board's considered opinion that the finances of the Association are now in such shape as to permit this to be done without curtailing the necessary activities of the Association.

Through the generous cooperation of Blue Cross and Blue Shield the Association has assisted in the publication of a new directory of the members. This directory is to be distributed free prior to the 1954 annual session to the members of the Association whose names appear in it.

For the past two years the Board has allocated funds to a student delegate from one of the medical schools in Texas to the annual session of the American Medical Association. Believing this to be of great importance, the Board now is allocating funds to a student from each of the three medical schools in Texas each year to attend the annual session of the American Medical Association.

In cooperation with the Committee on Public Relations the Board sponsored financially in each of the three medical schools last year a Medical Students' Day. This was received enthusiastically by the students and the faculties of the schools, and accordingly they will be sponsored again this year and enlarged upon.

Financial contributions have been made the past two years to the national essay contest sponsored by the Association of American Physicians and Surgeons. During 1953 the first and second place winners in Texas won second and third place respectively in the national contest. We believe this to be a fine gesture on the part of the medical profession in the public schools of this state, and therefore the amount of money allocated for state winners has been increased materially.

Realizing that a large percentage of the graduates of the medical schools of this state will practice medicine in Texas and in order to acquaint them with the Association and its activities as much as possible, the Board authorized and is now sending the TEXAS STATE JOURNAL OF MEDICINE to all seniors in the three medical schools.

The Board has given its cooperation and wholehearted support to the efforts of the Committees on Rural Health, Doctor Distribution, and Public Relations in their studies and surveys of rural health conditions in Texas. To show further the Association's interest in rural health problems, the Board is cooperating financially with the Council on Rural Health of the American Medical Association which met in Texas March 4-6 this year.

Personnel Changes

Miss Anna Keith, who had been with the Association for thirty years, was retired and Mr. E. Maxwell Jones, a certified public accountant, was employed as business manager of the Association. It is believed that with the tremendous increase in activities of the Association which calls for the purchase of considerable equipment and supplies, economies may be effected by the employment of a C. P. A. as business manager.

The Board has been concerned for some time with the problem of a closer liaison between the central office and the county medical societies. Texas is a large place geographically, and there are a large number of county medical societies. To resolve this problem and bring the central office and societies closer together, the Board has employed a field man, Mr. C. Lincoln Williston, who will report for duty April 1, 1954. The Board spent considerable time in interviewing candidates for this position and feels that Mr. Williston, because of his background and training, will be able to render a much needed service to the Association. It is anticipated that he will work closely with the Councilors in the various districts in their efforts to resolve problems

of the county medical societies and also to carry information regarding the activities of the central office to the membership throughout the state.

Budget for 1954

Considerable time was spent in a detailed study and analysis of the budget for 1954. This budget is available for study to any council, committee, or member of the Association. It is believed that the funds have been allocated where the greatest amount of good will inure to the members of the Association. The lists of the assets and liabilities of the Association follow in printed form. The complete audit of the Association's activities for 1953 is available upon request to the Executive Secretary of the Association.

Report of Auditor to Texas Medical Association

January 18, 1954.

Board of Trustees
Texas Medical Association
Austin, Texas
Gentlemen:

We have completed our examination of the books of account and record of the Texas Medical Association, Austin, Texas, for the calendar year 1953, and present our report.
